Sound Transit intends to extend the Link light rail system from the planned interim terminus at Northgate Transit Center to the Lynnwood Transit Center, as shown in Figure 1. The Lynnwood Link Extension project is an element of Sound Transit's adopted Long-Range Plan and is part of the Sound Transit 2 (ST2) Plan for regional transit investments approved by voters in 2008. The project is also included in the region's Metropolitan Transportation Plan (Puget Sound Regional Council's *Transportation 2040*). These plans anticipate the eventual extension of mass transit service north to Everett, connecting to a regional system serving other markets to the south and east, such as University of Washington, Capitol Hill, downtown Seattle, Bellevue, Redmond and SeaTac.

Sound Transit completed an Alternative Analysis (AA) in accordance with FTA New Starts guidelines in 2011. The AA developed and evaluated a range of transit mode and route alternatives to provide high capacity transit service between Northgate and the Lynnwood Transit Center. The performance of these alternatives was analyzed for transportation effectiveness, supportive land use and economic development effects, preservation of a healthy environment, cost & constructability, New Starts grant program competitiveness, and Sound Transit program affordability. The analysis and evaluation was documented in the *Alternatives Analysis Report and SEPA Addendum, September 2011.*

Sound Transit also gathered public input during the formulation of the alternatives to be considered in the AA and environmental review. Early environmental scoping was conducted in 2010 in conjunction with the AA process, and additional scoping was conducted in the fall of 2011. From September 30 to October 31, 2011, Sound Transit and the Federal Transit Administration (FTA) conducted public scoping for the North Corridor Transit Project EIS. Three scoping public meetings and one agency scoping meeting were held to solicit comments on the AA results and on the alternatives to be evaluated in the EIS. More than 240 people attended the public meetings, and staff from thirteen agencies and tribes attended the agency scoping meeting.

In December 2011 in Motion 2011-87, the Sound Transit Board narrowed the range of alternatives to be developed and studied in the EIS to light rail along I-5. Other modes and corridors were excluded from further study.

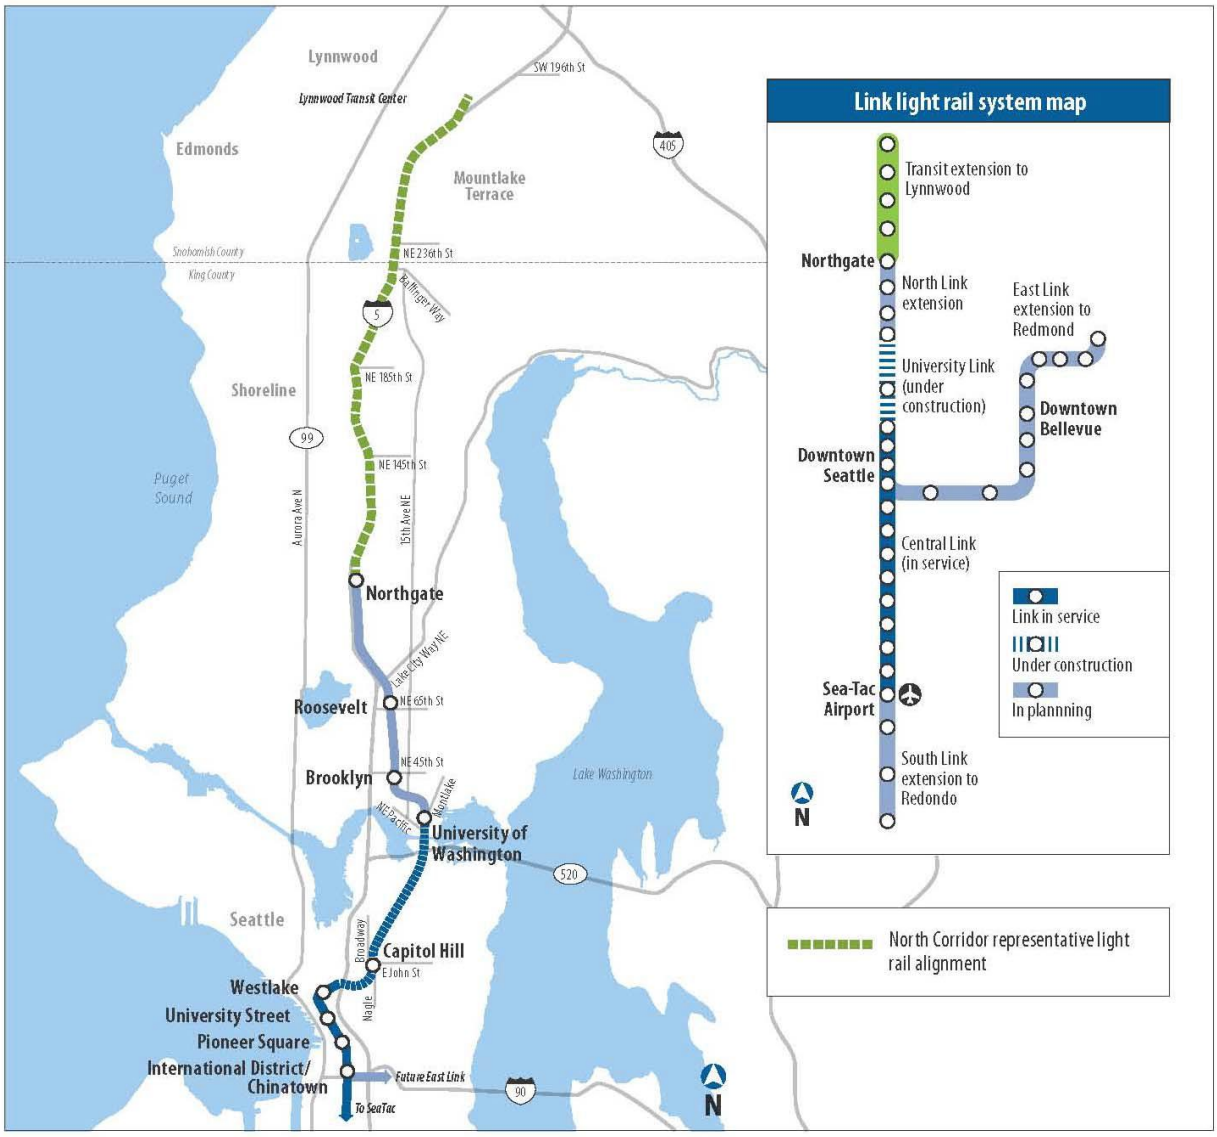

Figure 1: Lynnwood Link Extension Project Vicinity Map

Since that action, Sound Transit has further analyzed a variety of potential I-5 light rail alignment and station alternatives for the purpose of defining the alternatives to be studied in the EIS. The alternatives evaluated were identified through public and agency scoping comments or by the technical team

ALTERNATIVES DEVELOPMENT

The AA I-5 Alternative

One light rail alignment, profile and station access alternative along I-5 was defined and evaluated during the AA for comparison to other corridor and mode alternatives. The AA I-5 alternative has been carried forward for the purpose of assessing the relative advantages and disadvantages of additional I-5 light rail alignment and station alternatives identified through the EIS scoping process.

The AA I-5 alternative assumes that double track light rail guideway would be extended along the east side of I-5 from the end of the Northgate Station tail tracks to Mountlake Terrace in a mix of retained cut, retained fill and elevated profile, with an elevated station at NE 145th Street, a retained cut station at NE 185th Street and an elevated station at the Mountlake Terrace Transit Center. From there it would cross the northbound lanes of I-5 on elevated structure to the median where it would run in retained cut/retained fill profile to just south of the Lynnwood Transit Center. It would then cross the southbound lanes of I-5 on elevated structure and run on elevated guideway to an elevated station at the Lynnwood Transit Center. Expanded park and ride would be provided at NE 145th Street, NE 185th Street and Lynnwood Transit Center. The AA I-5 alternative is shown in Figure 2.

Figure 2: AA I-5 Alternative

Alternatives Suggested During Scoping

Several light rail station and alignment alternatives were suggested through scoping and are shown in Figures 3 and 4. Scoping comments are discussed in more detail in the *North Corridor Transit Project Environmental Scoping Summary Report* in Appendix A.

Other Alternatives

Along the I-5 corridor, light rail guideway could conceivably be placed along either side of the freeway or in the median. There are also numerous locations that could be considered for stations. A number of light rail station, alignment and profile alternatives have been considered aside from the AA I-5 alternative and the alternatives suggested through scoping.

ALTERNATIVES EVALUATION

All alternatives were first evaluated to identify any issues that could disqualify them from further analysis. Considerations included consistency with the approved ST2 program, station accessibility, major infrastructure development constraints, and Sound Transit policies and design guidance.

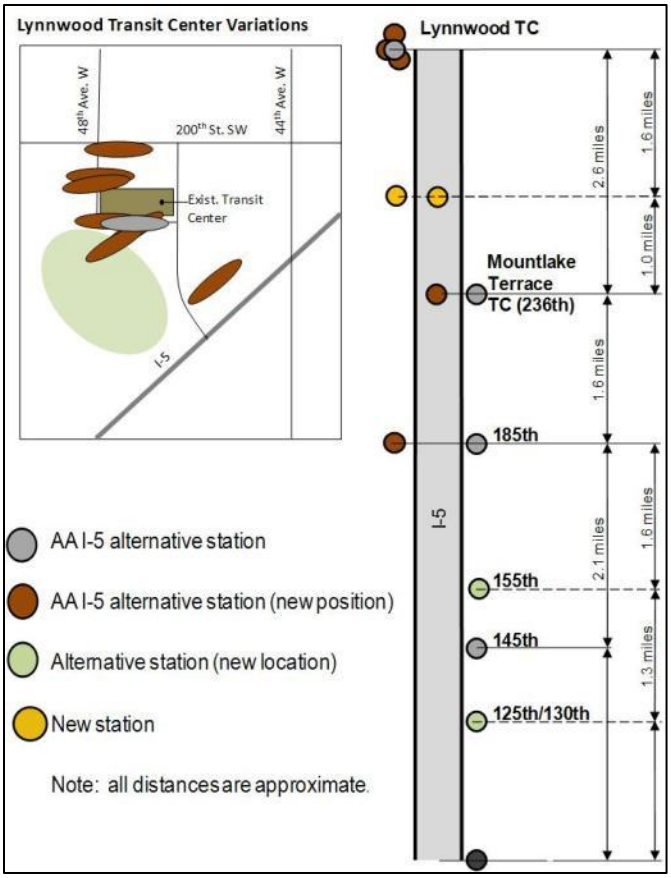

Figure 3: Station Alternatives

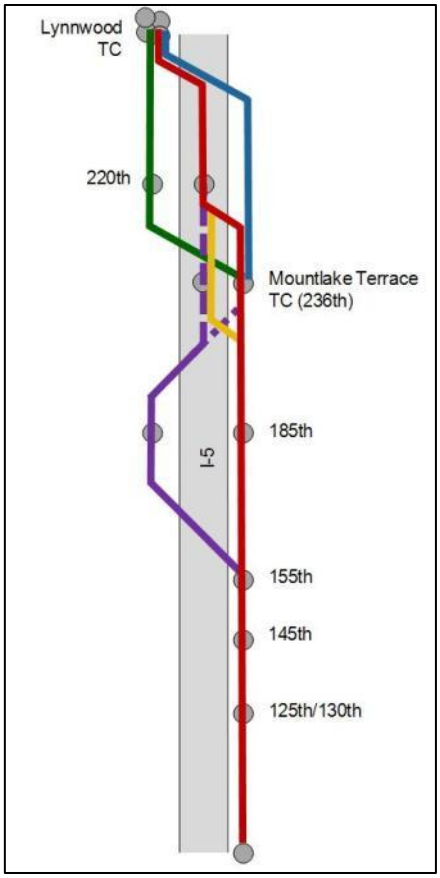

Figure 4: Alignment Alternatives

Those alternatives that passed the initial evaluation were analyzed further using the following evaluation criteria:

- Transportation performance (light rail travel time, pedestrian/bicycle access, bus access, automobile access)
- Ridership potential
- Environmental effects (noise, traffic, parks/recreation area and section 4(f)/6(f) resources, historic/Section 106 resources, wetland/ ecosystems/ water resources, visual, environmental justice)
- Station area development potential (existing land use and transit oriented development potential)
- Cost implications (capital and operations)
- Constructability (design deviations and I-5 impacts)
- Right-of-way/property implications (magnitude and types)

Evaluation was done as a comparison of the performance of each alternative relative to performance of the AA I-5 alternative. Each alternative was generally rated as performing better than, worse than or similar to that alternative, or having higher, lower or similar potential impacts or benefits.

PUBLIC INPUT

Sound Transit conducted an extensive outreach program including both early scoping and environmental scoping, ongoing agency engagement via an Interagency Technical Working Group (ITWG) of cities, counties and regional, state and transit agencies, and briefings to the Sound Transit Board and other stakeholders at key points in the AA and EIS processes to date. The alternatives defined, screened and evaluated in this briefing book were identified in part from public comments received during the EIS scoping process conducted in October 2011, which included three public meetings and one agency meeting with over 250 attendees and almost 70 written comments. Scoping comments are discussed in more detail in the *North Corridor Transit Project Environmental Scoping Summary Report* in Appendix A.

The alternatives and screening results have been shared with the ITWG and individual jurisdictions/agencies, and were shared with the public in March 2012 via 10 informal drop-in sessions throughout corridor. About 450 people participated in those sessions and about 150 written comments were received. Comments from the drop-in sessions are summarized in the *March 2012 Drop-In Session Summary* in Appendix B.

EVALUATION RESULTS

This section depicts and describes the station and alignment alternatives that were evaluated in detail in three project segments and assesses their performance relative to the AA I-5 alternative. The project segments are:

Segment A: Northgate through NE 185th Street Station

Segment B: NE 185th Street to 212th Street SW

Segment C: 212th Street SW to Lynnwood Transit Center

The depictions and descriptions of the alternatives are neither definitive nor final. They are based on the current early level of design (approximately 2%) and station access programming. They are intended to show the differences between alternatives when compared to the AA I-5 alternative and other alternatives in the same segment sufficient for the Board to identify the most promising alternatives for further evaluation in the EIS. A full evaluation of the alternatives identified by the Board for further study will be provided in the EIS.

Performance of the AA I-5 Alternative

The tables below summarize the performance of the AA I-5 alternative in each segment. This alternative is the basis of comparison for the other alternatives.

Segment A: Northgate through NE 185th Street Station

Criteria	Performance
Transportation Performance	Good travel time performance. 145th and 185th Street stations provide good bus and vehicle access, fair pedestrian and bike access.
Ridership Potential	Moderate ridership potential based on residential and population nearby, with parking provided at both stations.
Potential Environmental Effects	Generally moderate with higher effects in sensitive areas (streams and wetlands) and in areas of limited right of way, and potential property, park, historic, noise, visual and traffic impacts.
Development Potential	Low. High proportion of single-family development pattern. Limited development opportunities nearby.
Cost Implications (2010$ M)	Segment cost not calculated independently; total AA I-5 alternative cost is $1.4 - $1.6 billion (2010$).
Constructability	Constrained areas for construction and staging.
ROW Implications	Narrow WSDOT right-of-way provides some room to accommodate light rail but some private properties will need to be acquired in some areas along the alignment, and at stations.

Segment B: NE 185th Street to 212th Street SW

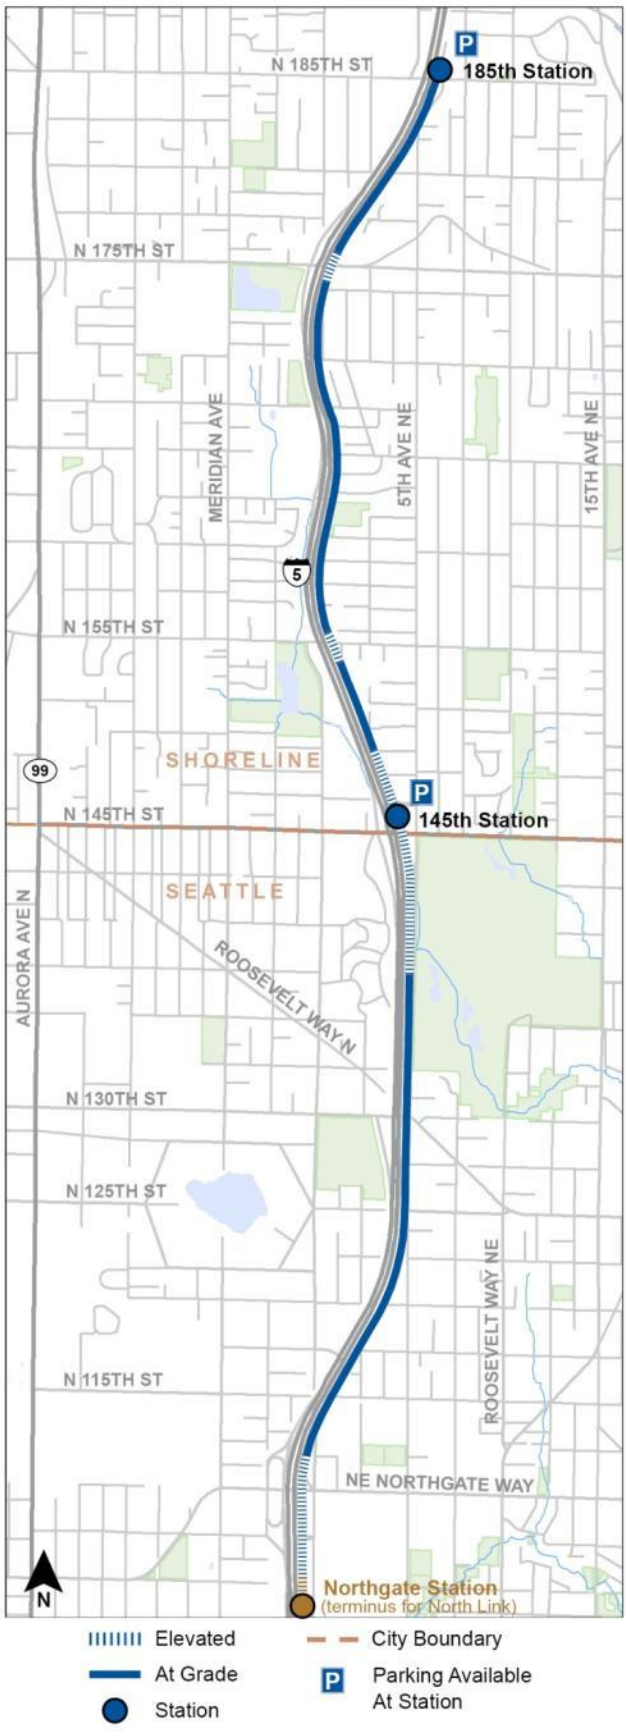
Criteria	Performance
Transportation Performance	Good travel time performance, but could have reduced operational speeds related to crossing I-5. Good bus and vehicle access to Mountlake Terrace Transit Center station. Fair pedestrian and bicycle access to station.
Ridership Potential	High ridership potential.
Potential Environmental Effects	Overall low to moderate level of impacts because much of the alignment is in the freeway median. Localized wetlands, noise and ecosystem impacts, mostly north of the Mountlake Terrace Transit Center.
Development Potential	Moderate development potential at Mountlake Terrace Transit Center Station, close proximity to designated Town Center.
Cost Implications (2010$ M)	Segment cost not calculated independently; total AA I-5 alternative cost is $1.4 - $1.6 billion (2010$).
Constructability	Low potential for design deviations and I-5 impacts, but could have staging implications related to crossing I-5.
ROW Implications	Low potential for property impacts because most of the alignment remains within I-5 right of way.

Segment C: 212th Street SW to Lynnwood Transit Center

Criteria	Performance
Transportation Performance	Good travel time performance. Good bus, vehicular, pedestrian and bicycle access at Lynnwood Transit Center.
Ridership Potential	High ridership potential.
Potential Environmental Effects	Higher levels of impacts, including to ecosystems from an elevated crossing of a stream and wetlands area, and visual, noise and

	potential displacement impacts to commercial and residential properties, and impacts related to the elevated guideway through Scriber Creek Park
Development Potential	High development potential at Lynnwood Transit Center and adjacent Lynnwood City Center. Mix of land uses compatible with existing zoning and City Center plan.
Cost Implications (2010$ M)	Segment cost not calculated independently; total AA I-5 alternative cost is $1.4 - $1.6 billion (2010$).
Constructability	Difficult to construct where it crosses the wetlands and park.
ROW Implications	Crosses a large parcel owned by Edmonds School District, which has development plans for the affected site, and alignment requires portions of several commercial and multifamily residential parcels, with potential displacements.

A1: AT-GRADE/ELEVATED TO 145TH AND 185TH EAST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 117th Street, then in retained cut/fill to north of 130th Street, then elevated to north of 145th Street, then retained cut/fill to 185th Street except for elevated crossings of 155th and 175th Street.

Stations: An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 145th Street. A retained cut/fill station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

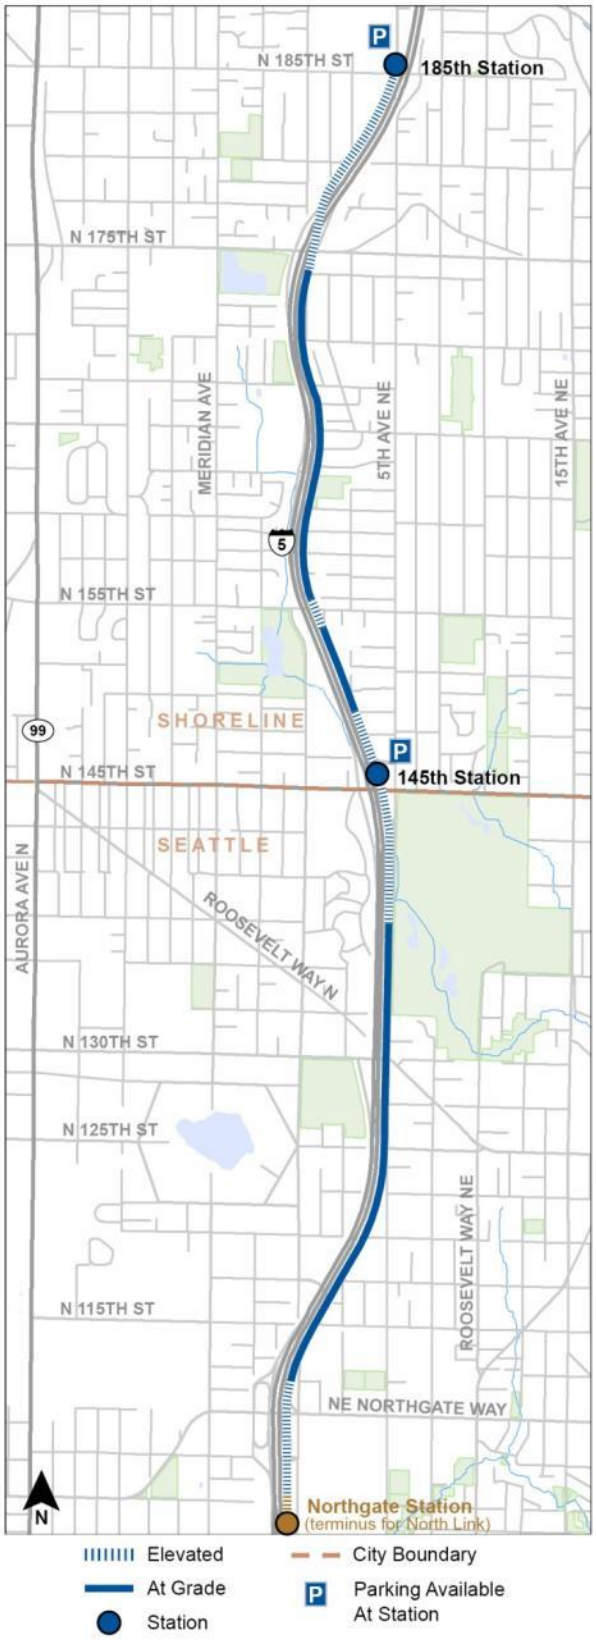
Relative pros and cons of this alternative:

- Provides regional service coverage in North Seattle and Shoreline
- 145th Street station serves both local and freeway access and provides opportunities to feed existing commuter buses to rail
- 185th Street station serves local access needs and supports potential redevelopment near the station
- Guideway profile optimized to reduce cost and provide additional flexibility to avoid some environmental impacts such as ecosystems

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Similar
Development Potential	Similar
Cost Implications	Similar
Constructability	Similar
ROW Implications	Similar

A2: AT-GRADE/ELEVATED TO 145TH EAST SIDE AND 185TH WEST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 117th Street, then in retained cut/fill from to north of 130th Street, then elevated to north of 145th Street, then retained cut/fill to 175th Street except for elevated crossings of 155th and 175th Street. North of 175th Street the guideway crosses I-5 on elevated structure to the west side and runs on elevated structure to 185th Street.

Stations: An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 145th Street. An elevated or retained cut station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

Relative pros and cons of this alternative:

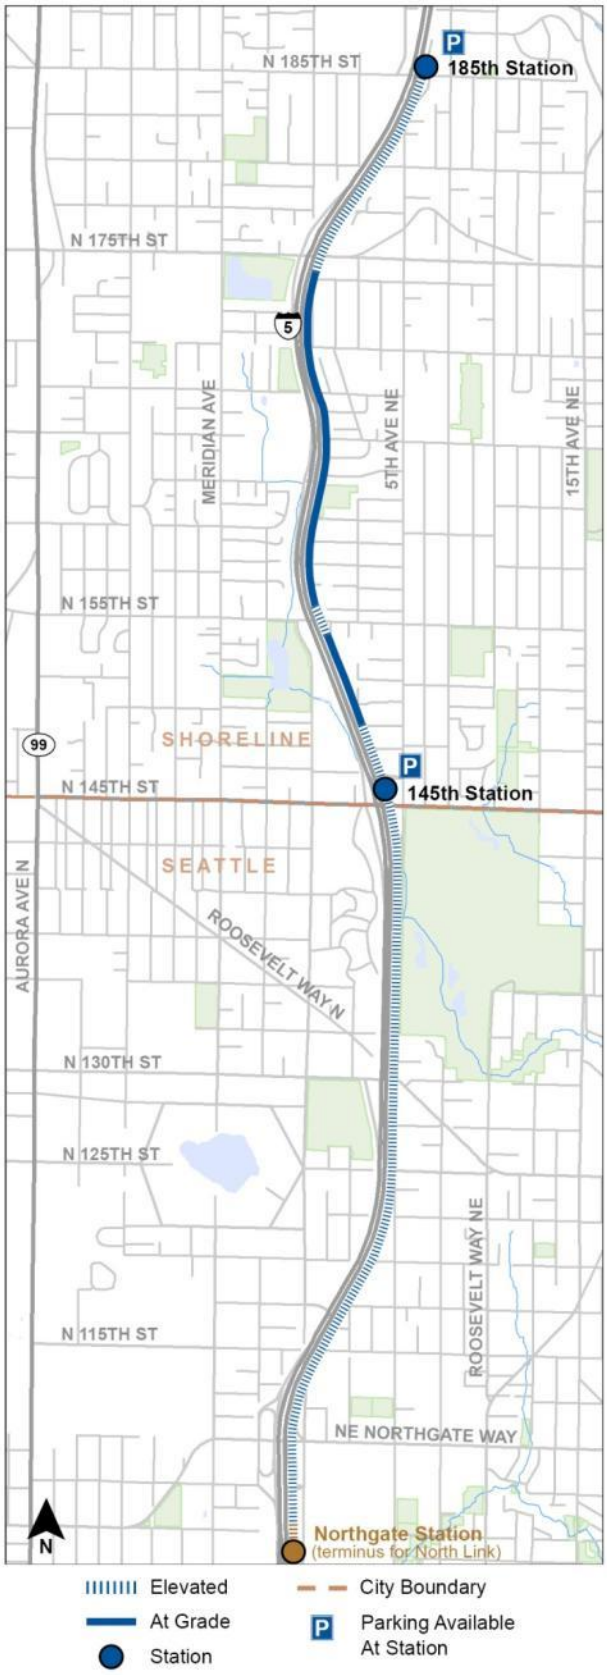
- Service coverage and station access similar to A1
- Guideway profile optimized to reduce cost (except for I-5 crossing), but I-5 crossing increases potential visual and historic impacts
- Places the 185th Street station slightly closer to potential transit-oriented development opportunities

Evaluation results: (see next page)

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Slight improvement in access at 185th Street due to station being closer to presumed park and ride sites and bus service.
Ridership Potential	Similar
Potential Environmental Effects	Similar except for higher potential visual and historic impacts. However, a west side alignment increases impacts into Segment B.
Development Potential	Similar
Cost Implications (2010$ M)	$40M to $50M more, plus potential additional costs in Segment B, depending on alternative.
Constructability	Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5; also adds additional I-5 crossing in Segment B.
ROW Implications	Slightly less

A3: MOSTLY ELEVATED TO 145TH AND 185TH EAST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 145th Street, then retained cut/fill to south of 175th Street except for an elevated crossing of 155th Street, then elevated to 185th Street.

Stations: An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 145th Street. An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

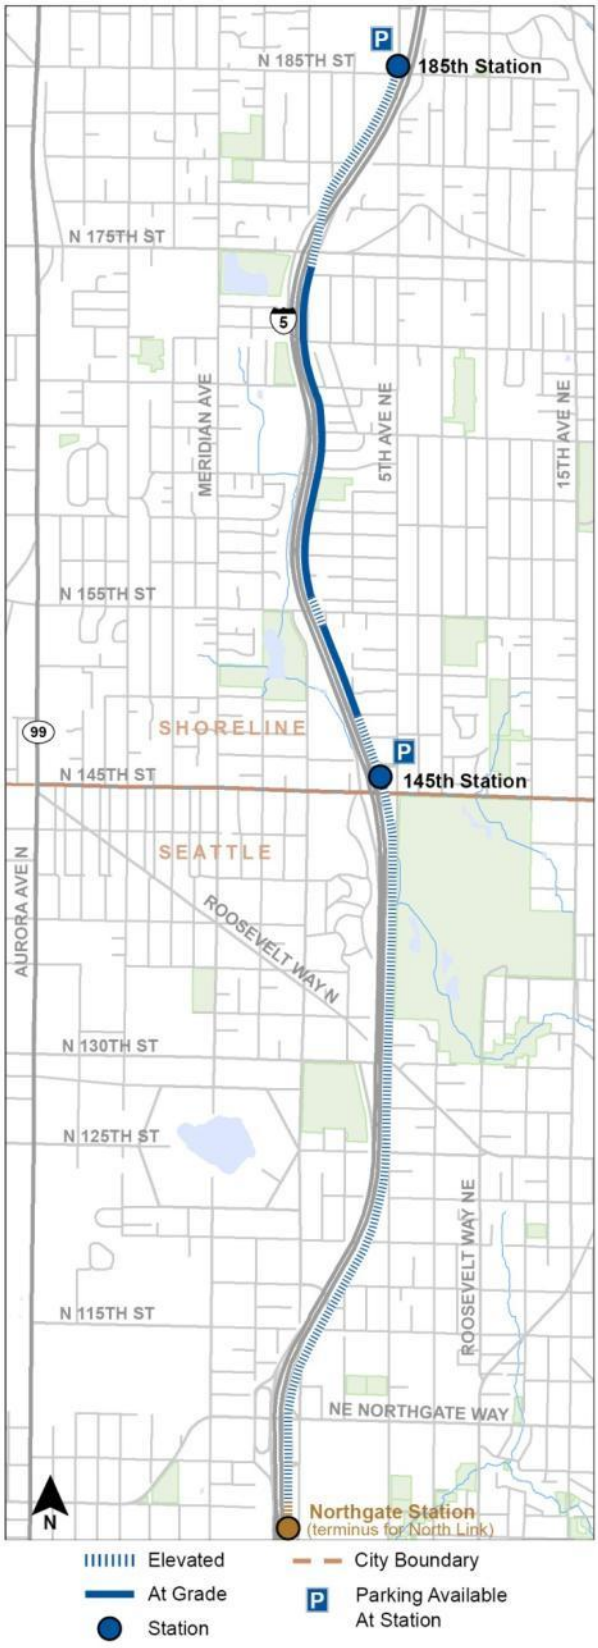
Relative pros and cons of this alternative:

- Service coverage and station access similar to A1
- More elevated guideway could reduce potential impacts to I-5 bridges and ramps, some properties and some environmental resources, but increases costs

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Similar
Development Potential	Similar
Cost Implications (2010 $)	$90M to $105M more
Constructability	Potentially less difficult by avoiding 117th and 130th St. bridges
ROW Implications	Lower potential for property impacts

A4: MOSTLY ELEVATED TO 145TH EAST SIDE AND 185TH WEST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 145th Street, then retained cut/fill to south of 175th Street except for elevated crossings of 155th and 175th Streets. North of 175th Street the guideway crosses I-5 on elevated structure to the west side and runs on elevated structure to 185th Street.

Stations: An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 145th Street. An elevated or retained cut station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

Relative pros and cons of this alternative:

- Service coverage and station access similar to A1
- More elevated guideway could reduce potential impacts to I-5 bridges and ramps, some properties and some environmental resources, but increases costs
- Places the 185th Street station slightly closer to potential transit-oriented development opportunities
- I-5 crossing and west side elevated structure increases potential visual and historic impacts

Evaluation results: (see next page)

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Slight improvement in access at 185th Street due to station being closer to presumed park and ride sites and bus service.
Ridership Potential	Similar
Potential Environmental Effects	Similar, with higher visual and historic impacts and lower ecosystem impacts due to elevated structures. However, a west side alignment increases impacts into Segment B.
Development Potential	Similar
Cost Implications (2010$ M)	$105M $120M more
Constructability	Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5; also adds additional I-5 crossing in Segment B.
ROW Implications	Slightly less

A5: AT-GRADE/ELEVATED TO 130TH, 155TH AND 185TH EAST SIDE STATIONS

Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 117th Street, then in retained cut/fill to north of 130th Street, then elevated to north of 145th Street, then retained cut/fill to 185th Street except for elevated crossings of 155th and 175th Street.

Stations: A retained cut/fill station with on-street bus facilities would be located at 130th Street. An elevated station would straddle 155th Street with up to 500 park and ride stalls and on-street bus facilities nearby. A retained cut/fill station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

Relative pros and cons of this alternative:

- Three stations provide more service coverage and ridership potential in this segment than the two stations included in Alternatives A1 through A4.
- Station at 130th Street has more apparent opportunity for transit oriented development, but less opportunity for access from the freeway
- 185th Street station serves local access needs and supports potential redevelopment near the station
- Guideway profile optimized to reduce cost and provide additional flexibility to avoid some environmental impacts such as ecosystems

Evaluation results: (see next page)

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Travel times would be slightly slower due to added station
Ridership Potential	Moderate Increase as result of doubling population within walking distance due to added station
Potential Environmental Effects	Similar. Potential for higher historic impacts; lower ecosystem impacts
Development Potential	Slightly better. 130th Street Station is within 0.5 miles of existing commercial node. Otherwise, predominantly single-family surrounds stations.
Cost Implications (2010$ M)	$40M to $45M more
Constructability	Slightly more difficult, due to wider section at 130th Street Station and fewer staging areas available at 130th and 155th compared to 145th Street.
ROW Implications	Similar with localized differences in station areas

A6: AT-GRADE/ELEVATED TO 130TH AND 155TH EAST SIDE AND 185TH WEST SIDE STATIONS

Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 117th Street, then in retained cut/fill from to north of 130th Street, then elevated to north of 145th Street, then retained cut/fill to 175th Street except for elevated crossings of 155th and 175th Street. North of 175th Street the guideway crosses I-5 on elevated structure to the west side and runs on elevated structure to 185th Street.

Stations: A retained cut/fill station with on-street bus facilities would be located at 130th Street. An elevated station would straddle 155th Street with up to 500 park and ride stalls and on-street bus facilities nearby. An elevated or retained cut station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

Relative pros and cons of this alternative:

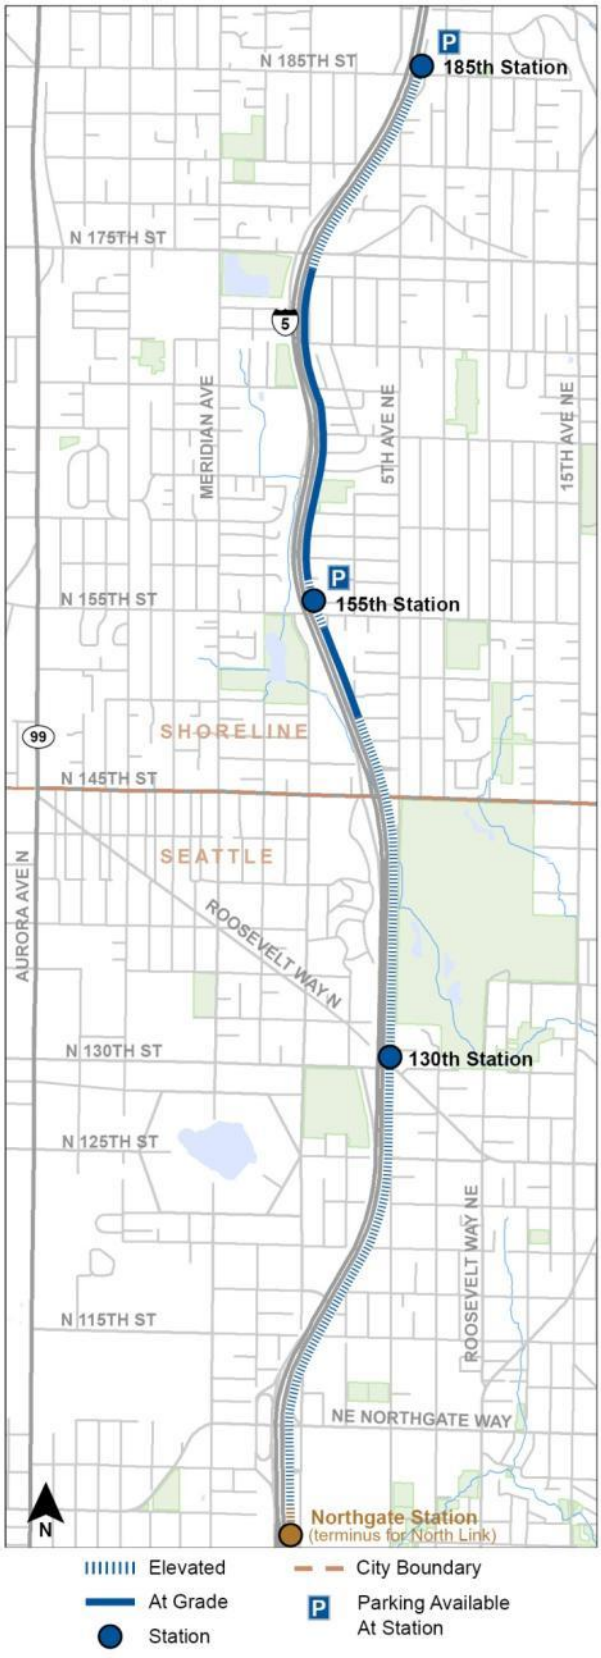
- Service coverage, station access, ridership and transit-oriented development opportunities similar to A5
- Places the 185th Street station slightly closer to potential transit-oriented development opportunities
- Guideway profile optimized to reduce cost (except for I-5 crossing), but I-5 crossing increases potential visual and historic impacts

Evaluation results: (see next page)

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Travel times would be slightly slower due to added station. Slight improvement in access at 185th Street due to station platform being closer to parking garage and bus service.
Ridership Potential	Moderate Increase as result of doubling population within walking distance due to added station
Potential Environmental Effects	Similar. Potential for higher historic and visual impacts, lower ecosystem impacts. Westside alignment increases impacts moving into Segment B.
Development Potential	Slightly better. 130th Street Station is within 0.5 miles of existing commercial node. Otherwise, predominantly single-family surrounds stations.
Cost Implications (2010$ M)	$80M to $95M more, plus additional costs in Segment B depending on alternative.
Constructability	Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5; also adds additional I-5 crossing in Segment B.
ROW Implications	Slightly less

A7: MOSTLY ELEVATED TO 130TH, 155TH AND 185TH EAST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 145th Street, then retained cut/fill to south of 175th Street except for an elevated crossing of 155th Street, then elevated to 185th Street.

Stations: An elevated station with on-street bus facilities would be located at 130th Street. An elevated station would straddle 155th Street with up to 500 park and ride stalls and on-street bus facilities nearby. An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

Relative pros and cons of this alternative:

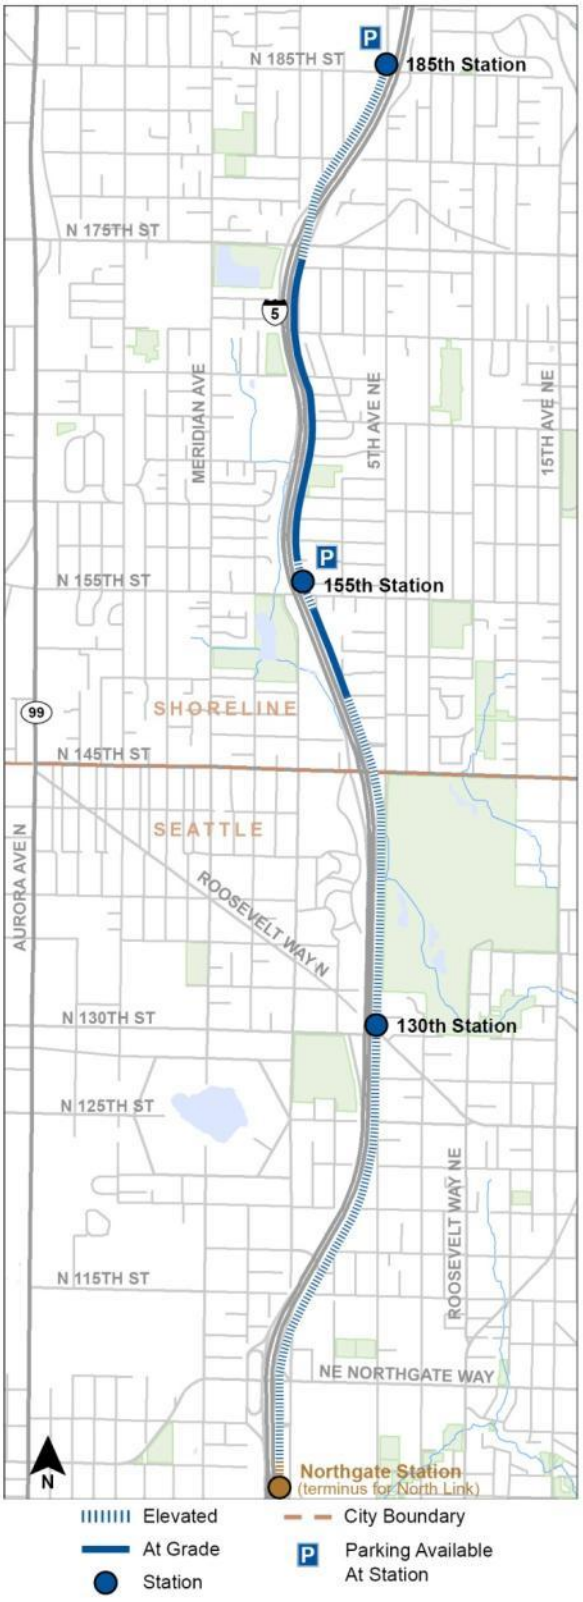
- Service coverage, station access, ridership and transit-oriented development opportunities similar to A5
- More elevated guideway could reduce potential impacts to I-5 bridges and ramps, some properties and some environmental resources, but increases costs

Evaluation results: (see next page)

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Travel times would be slightly slower due to added station
Ridership Potential	Moderate Increase as result of doubling population within walking distance due to added station
Potential Environmental Effects	Similar. Higher potential for visual impacts but more ability to reduce ecosystem impacts.
Development Potential	Slightly better. 130th Street Station is within 0.5 miles of existing commercial node. Otherwise, predominantly single-family surrounds stations.
Cost Implications (2010$ M)	$120M to $135M more
Constructability	Potentially less difficult if 117th and 130th St. bridges are avoided, but there are fewer staging areas available at 130th and 155th compared to 145th Street.
ROW Implications	Similar, with localized differences in station areas

A8: MOSTLY ELEVATED TO 130TH AND 155TH EAST SIDE AND 185TH WEST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 145th Street, then retained cut/fill to south of 175th Street except for elevated crossings of 155th and 175th Streets. North of 175th Street the guideway crosses I-5 on elevated structure to the west side and runs on elevated structure to 185th Street.

Stations: An elevated station with on-street bus facilities would be located at 130th Street. An elevated station would straddle 155th Street with up to 500 park and ride stalls and on-street bus facilities nearby. An elevated or retained cut station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

Relative pros and cons of this alternative:

- Service coverage, station access, ridership and transit-oriented development opportunities similar to A5
- More elevated guideway could reduce potential impacts to I-5 bridges and ramps, some properties and some environmental resources, but increases costs
- Places the 185th Street station slightly closer to potential transit-oriented development opportunities

Evaluation results: (see next page)

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Travel times would be slightly slower due to added station. Slight improvement in access at 185th Street due to station platform being closer to parking garage and bus service.
Ridership Potential	Moderate Increase as result of doubling population within walking distance due to added station
Potential Environmental Effects	Higher potential for noise, historic and visual impacts, with potential reduction in ecosystem impacts. A west side alignment increases impacts moving into Segment B.
Development Potential	Slightly better. 130th Street Station is within 0.5 miles of existing commercial node. Otherwise, predominantly single-family surrounds stations.
Cost Implications (2010$ M)	$130M to $150M more, plus possible additional costs in Segment B, depending on alternative
Constructability	Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5; also adds additional I-5 crossing in Segment B.
ROW Implications	Similar, but with localized differences in station areas

B1: EAST SIDE TO MOUNTLAKE TERRACE TRANSIT CENTER TO MEDIAN

Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on retained cut/fill to about NE 200th Street, then elevated to the Mountlake Terrace Transit Center. Some elevated guideway would be necessary near NE 185th Street to connect if the 185th Street station were elevated. North of Mountlake Terrace, the guideway would cross the northbound lanes of I-5 on elevated structure then transition to retained cut/fill in the median of I-5 near 230th Street SW, then run in retained cut/fill in the median to 212th Street SW.

Stations: An elevated station would be located at the Mountlake Terrace Transit Center along with expanded on- and off-street bus facilities. The existing 880 park and ride stalls would be maintained but not expanded.

Relative pros and cons of this alternative:

- The station is located at the existing focus of transit service and access for the city at the transit center, leveraging existing transit investment
- The station placement is closest to the Mountlake Terrace city center and nearby transit-oriented development opportunities
- No clear continuing transit purpose for the adjacent freeway station when bus service is restructured in response to light rail service
- Median alignment between Mountlake Terrace and Lynnwood is the least expensive guideway option

Evaluation results: (see next page)

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Similar
Development Potential	Similar
Cost Implications (2010$ M)	Similar
Constructability	Similar
ROW Implications	Similar

B2: EAST SIDE TO MOUNTLAKE TERRACE TRANSIT CENTER TO WEST SIDE

Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on retained cut/fill to about NE 200th Street, then elevated to the Mountlake Terrace Transit Center. Some elevated guideway would be necessary near NE 185th Street to connect if the 185th Street station were elevated. North of Mountlake Terrace, the guideway would cross the northbound and southbound lanes of I-5 on elevated structure then to the west side of the freeway, then runs in retained cut/fill to south of 220th Street SW, then largely on elevated structure to 212th Street SW.

Stations: An elevated station would be located at the Mountlake Terrace Transit Center along with expanded on- and off-street bus facilities. The existing 880 park and ride stalls would be maintained but not expanded.

Relative pros and cons of this alternative:

- Station access and transit-oriented development opportunities similar to B1
- Crossing over the entire I-5 freeway to the west side near Mountlake Terrace Transit Center can be accomplished more directly and on shorter, less expensive structures than with the split crossing required in some other alternatives
- West side alignment between Mountlake Terrace and Lynnwood provides the opportunity for a future station at 220th Street
- No clear continuing transit purpose for the adjacent freeway station when bus service is restructured in response to light rail service
- Fewer potential environmental impacts than an east side alignment between Mountlake Terrace and Lynnwood

Evaluation Results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Higher level of impacts, including higher ecosystems, noise and visual due to alignment on the west side of the freeway.
Development Potential	Similar
Cost Implications (2010$ M)	$65M to $85M more
Constructability	Improvement due to single crossing of I-5. Also, construction staging outside of the highway is better than in median.
ROW Implications	Moderate increase in need for additional properties outside I-5 ROW.

B2A: EAST SIDE TO MOUNTLAKE TERRACE TRANSIT CENTER TO WEST SIDE WITH 220TH STATION

Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on retained cut/fill to about NE 200th Street, then elevated to the Mountlake Terrace Transit Center. Some elevated guideway would be necessary near NE 185th Street to connect if the 185th Street station were elevated. North of Mountlake Terrace, the guideway would cross the northbound and southbound lanes of I-5 on elevated structure then to the west side of the freeway, then runs in retained cut/fill to south of 220th Street SW, then largely on elevated structure to 212th Street SW.

Stations: An elevated station would be located at the Mountlake Terrace Transit Center along with expanded on- and off-street bus facilities. The existing 880 park and ride stalls would be maintained but not expanded. An at-grade/elevated station would be located just south of 220th Street SW.

Relative pros and cons of this alternative:

- A 220th station was not included in the voter-approved ST2 Plan and might require plan amendment to add it to this extension
- Station access and transit-oriented development opportunities enhanced by addition of second station in this segment near higher density residential and employment area
- Crossing over the entire I-5 freeway to the west side near Mountlake Terrace Transit Center can be accomplished more directly and on shorter, less expensive structures than with the split crossing required in some other alternatives
- No clear continuing transit purpose for the adjacent freeway station when bus service is restructured in response to light rail service

- Fewer potential environmental impacts than an east side alignment between Mountlake Terrace and Lynnwood

Evaluation Results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Travel times would be slightly slower due to added station but system access would be improved
Ridership Potential	Higher due to added station
Potential Environmental Effects	Higher level of impacts, including higher ecosystems, noise and visual due to alignment on the west side of the freeway. Station at 220th could increase potential for historic impacts.
Development Potential	Greater due to added station in higher density residential and employment area
Cost Implications (2010$ M)	$110M to $130M more
Constructability	Improvement due to single crossing of I-5. Also, construction staging outside of the highway is better than in median.
ROW Implications	Moderate increase in need for additional properties outside I-5 ROW.

B3: EAST SIDE TO MOUNTLAKE TERRACE TRANSIT CENTER TO EAST SIDE

Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on retained cut/fill to about NE 200th Street, then elevated to the Mountlake Terrace Transit Center. Some elevated guideway would be necessary near NE 185th Street to connect if the 185th Street station were elevated. North of Mountlake Terrace, the guideway would continue largely on elevated structure along the east side of I-5 to 212th Street SW.

Stations: An elevated station would be located at the Mountlake Terrace Transit Center along with expanded on- and off-street bus facilities. The existing 880 park and ride stalls would be maintained but not expanded.

Relative pros and cons of this alternative:

- Station access and transit-oriented development opportunities similar to B1
- Crossing over the entire I-5 freeway to the west side near 212th Street SW can be accomplished more directly and on shorter, less expensive structures than with the split crossing required in some other alternatives
- No clear continuing transit purpose for the adjacent freeway station when bus service is restructured in response to light rail service

Evaluation results: (see next page)

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Higher potential for noise, visual, and ecosystems impacts due to extended section along I-5 through a greenbelt separating I-5 from residential neighborhoods.
Development Potential	Similar
Cost Implications (2010$ M)	$65M to $85M more
Constructability	Improvement, due to single crossing of I-5. Also, construction staging outside of the highway is better than in median
ROW Implications	Moderate increase in need for additional properties outside of I-5 ROW.

B4: EAST SIDE TO MOUNTLAKE TERRACE FREEWAY STATION TO MEDIAN

Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on retained cut/fill to about NE 200th Street, then elevated to about 240th Street SW. Some elevated guideway would be necessary near NE 185th Street to connect if the 185th Street station were elevated. From 240th Street, the guideway would cross the northbound lanes of I-5 on elevated structure then transition to retained cut/fill in the median of I-5 south of the 236th Street SW overpass, then run at grade in the median to the Mountlake Terrace Freeway Station. From the station it would run in retained cut/fill in the median to 212th Street SW.

Stations: The existing at-grade Mountlake Terrace Freeway Station would be extended and converted to light rail use, including a new pedestrian bridge over the northbound lanes of I-5 at the north end of the platform to tie into the Mountlake Terrace street grid at 232nd Street SW. The existing 880 stall park and ride and adjacent transit center would be utilized without further improvement, but on-street bus facilities near the transit center would be expanded.

Relative pros and cons of this alternative:

- Reusing the freeway station saves capital cost and provides a continuing transit purpose for the facility when bus services are restructured in response to new light rail service
- Guideway geometry required to access the median of I-5 south of 236th Street SW would introduce speed restrictions and some delay to the system
- Transit-oriented development opportunities similar to B1, but station access would require longer walks to the station in middle of the freeway.

- Avoids construction disruption of the Mountlake Terrace Transit Center

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Slightly lower due to increased walk distance (approximately 800 feet) between station platform and parking and bus transfer at Mountlake Terrace, and poorer platform waiting environment.
Ridership Potential	Small reduction due to longer walk access to station platform.
Potential Environmental Effects	Generally reduced because alignment avoids localized noise and ecosystem impacts north of Mountlake Terrace Transit Center, but would have higher visual and ecosystem impacts associated with the second pedestrian bridge.
Development Potential	Similar
Cost Implications (2010$ M)	$30M Less
Constructability	Substantially more difficult, due to deviations, reduced speeds, and median construction related to crossing into median to the Mountlake Terrace Freeway Station.
ROW Implications	Similar

B5: WEST SIDE TO MOUNTLAKE TERRACE FREEWAY STATION TO MEDIAN

Guideway: The guideway runs along the west side of I-5, in WSDOT rights-of-way wherever possible, elevated from the west side 185th Street station, transitioning to retained cut/fill to about NE 200th Street, then elevated to about 240th Street SW. From 240th Street, the guideway would cross the southbound lanes of I-5 on elevated structure then transition to retained cut/fill in the median of I-5 south of the 236th Street SW overpass, then run at grade in the median to the Mountlake Terrace Freeway Station. From the station it would run in retained cut/fill in the median to 212th Street SW. *This alternative would only be connected with Segment A alternatives that include a west side station at NE 185th Street*.

Stations: The existing at-grade Mountlake Terrace Freeway Station would be extended and converted to light rail use, including a new pedestrian bridge over the northbound lanes of I-5 at the north end of the platform to tie into the Mountlake Terrace street grid at 232nd Street SW. The existing 880 stall park and ride and adjacent transit center would be utilized without further improvement, but on-street bus facilities near the transit center would be expanded.

Relative pros and cons of this alternative:

- This alternative requires that the guideway cross all lanes of I-5 two times between Northgate and Lynnwood, with added cost and construction impacts
- Reusing the freeway station saves capital cost and provides a continuing transit purpose for the facility when bus services are restructured in response to new light rail service
- Guideway geometry required to access the median of I-5 south of 236th Street SW would introduce speed restrictions and delay to the system

- Transit-oriented development opportunities similar to B1, but station access would require longer walks to the station in middle of the freeway.
- Avoids construction disruption of the Mountlake Terrace Transit Center

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Slightly lower due to increased walk distance (approximately 800 feet) between station platform and parking and bus transfer at Mountlake Terrace, and poorer platform waiting environment.
Ridership Potential	Small reduction due to longer walk access to station platform.
Potential Environmental Effects	Increased due to higher visual and ecosystem impacts along the west side from 185th, and higher visual and ecosystem impacts associated with second pedestrian bridge.
Development Potential	Similar
Cost Implications (2010$ M)	$15M to $20M More
Constructability	Substantially more difficult, due to deviations, reduced speeds, and median construction related to crossing into median to the Mountlake Terrace Freeway Station.
ROW Implications	Similar.

B6: WEST SIDE TO MOUNTLAKE TERRACE TRANSIT CENTER TO MEDIAN

Guideway: The guideway runs along the west side of I-5, in WSDOT rights-of-way wherever possible, elevated from the west side 185th Street station and across I-5 to the east side near NE 190th Street, then generally elevated to Mountlake Terrace Transit Center. North of Mountlake Terrace, the guideway would cross the northbound lanes of I-5 on elevated structure then transition to retained cut/fill in the median of I-5 near 230th Street SW, then run in retained cut/fill in the median to 212th Street SW. *This alternative would only be conncected with Segment A alternatives that include a west side station at NE 185th Street*.

Stations: An elevated station would be located at the Mountlake Terrace Transit Center along with expanded on- and off-street bus facilities. The existing 880 park and ride stalls would be maintained but not expanded.

Relative pros and cons of this alternative:

- This alternative requires that the guideway cross all lanes of I-5 three times between Northgate and Lynnwood, with added cost and construction impacts
- Station access and transit-oriented development opportunities similar to B1
- No clear continuing transit purpose for the adjacent freeway station when bus service is restructured in response to light rail service
- Median alignment between Mountlake Terrace and Lynnwood is the least expensive guideway option

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Overall similar but with higher visual impacts from sections along the west side of I-5 and then transitioning to the east prior the Mountlake Terrace Transit Center.
Development Potential	Similar
Cost Implications (2010$ M)	$50M to $60M more
Constructability	Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5.
ROW Implications	Overall similar, but higher potential for increased property impacts from the west/east crossing south of the Mountlake Terrace Transit Center.

B7: WEST SIDE TO MOUNTLAKE TERRACE TRANSIT CENTER TO WEST SIDE

Guideway: The guideway runs along the west side of I-5, in WSDOT rights-of-way wherever possible, elevated from the west side 185th Street station and across I-5 to the east side near NE 190th Street, then generally elevated to Mountlake Terrace Transit Center. North of Mountlake Terrace, the guideway would cross the northbound and southbound lanes of I-5 on elevated structure then to the west side of the freeway, then run in retained cut/fill to south of 220th Street SW, then largely on elevated structure to 212th Street SW. *This alternative would only be connected with Segment A alternatives that include a west side station at NE 185th Street*.

Stations: An elevated station would be located at the Mountlake Terrace Transit Center along with expanded on- and off-street bus facilities. The existing 880 park and ride stalls would be maintained but not expanded.

Relative pros and cons of this alternative:

- This alternative requires that the guideway cross all lanes of I-5 three times between Northgate and Lynnwood, with added cost and construction impacts
- Station access and transit-oriented development opportunities similar to B1
- No clear continuing transit purpose for the adjacent freeway station when bus service is restructured in response to light rail service
- Crossing back over the entire I-5 freeway to the west side near Mountlake Terrace Transit Center can be accomplished more directly and on shorter, less expensive structures than with the split crossing required in some other alternatives

- West side alignment between Mountlake Terrace and Lynnwood provides the opportunity for a future station at 220th Street
- Fewer potential environmental impacts than an east side alignment between Mountlake Terrace and Lynnwood.

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Markedly increased, including higher visual impacts along the west side from 185th to the Mountlake Terrace Transit Center. To the north, higher visual, ecosystem and noise impacts, including for the transition back to the west side and along the west side greenbelt up to S. 220th Street. Higher ecosystem impacts also near S. 212th Street.
Development Potential	Similar
Cost Implications (2010$ M)	$110M to $140M more
Constructability	Substantially more difficult due to additional crossing of I-5
ROW Implications	Moderate increase in need for additional properties outside of I-5 ROW.

B7A: WEST SIDE TO MOUNTLAKE TERRACE TRANSIT CENTER TO WEST SIDE WITH 220TH STATION

Guideway: The guideway runs along the west side of I-5, in WSDOT rights-of-way wherever possible, elevated from the west side 185th Street station and across I-5 to the east side near NE 190th Street, then generally elevated to Mountlake Terrace Transit Center. North of Mountlake Terrace, the guideway would cross the northbound and southbound lanes of I-5 on elevated structure then to the west side of the freeway, then run in retained cut/fill to south of 220th Street SW, then largely on elevated structure to 212th Street SW. *This alternative would only be connected with Segment A alternatives that include a west side station at NE 185th Street*.

Stations: An elevated station would be located at the Mountlake Terrace Transit Center along with expanded on- and off-street bus facilities. The existing 880 park and ride stalls would be maintained but not expanded.

Relative pros and cons of this alternative:

- A 220th station was not included in the voter-approved ST2 Plan and might require plan amendment to add it to this extension
- This alternative requires that the guideway cross all lanes of I-5 three times between Northgate and Lynnwood, with added cost and construction impacts
- Station access and transit-oriented development opportunities enhanced by addition of second station in this segment near higher density residential and employment area
- No clear continuing transit purpose for the adjacent freeway station when bus service is restructured in response to light rail service
- Crossing back over the entire I-5 freeway to the west side near Mountlake Terrace Transit

Center can be accomplished more directly and on shorter, less expensive structures than with the split crossing required in some other alternatives

- West side alignment between Mountlake Terrace and Lynnwood provides the opportunity for a future station at 220th Street
- Fewer potential environmental impacts than an east side alignment between Mountlake Terrace and Lynnwood.

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Travel times would be slightly slower due to added station but system access would be improved
Ridership Potential	Higher due to added station
Potential Environmental Effects	Markedly increased, including higher visual impacts along the west side from 185th to the Mountlake Terrace Transit Center. To the north, higher visual, ecosystem and noise impacts, including for the transition back to the west side and along the west side greenbelt up to S. 220th Street. Higher ecosystem impacts also near S. 212th Street. Station at 220th could increase potential for historic impacts.
Development Potential	Greater due to added station in higher density residential and employment area
Cost Implications (2010$ M)	$150M to $180M more
Constructability	Substantially more difficult due to additional crossing of I-5
ROW Implications	Moderate increase in need for additional properties outside of I-5 ROW.

B8: WEST SIDE TO MOUNTLAKE TERRACE TRANSIT CENTER TO EAST SIDE

Guideway: The guideway runs along the west side of I-5, in WSDOT rights-of-way wherever possible, elevated from the west side 185th Street station and across I-5 to the east side near NE 190th Street, then generally elevated to Mountlake Terrace Transit Center. North of Mountlake Terrace, the guideway would continue largely on elevated structure along the east side of I-5 to 212th Street SW. *This alternative would only be connected with Segment A alternatives that include a west side station at NE 185th Street*.

Stations: An elevated station would be located at the Mountlake Terrace Transit Center along with expanded on- and off-street bus facilities. The existing 880 park and ride stalls would be maintained but not expanded.

Relative pros and cons of this alternative:

- This alternative requires that the guideway cross all lanes of I-5 three times between Northgate and Lynnwood, with added cost and construction impacts
- Station access and transit-oriented development opportunities similar to B1
- No clear continuing transit purpose for the adjacent freeway station when bus service is restructured in response to light rail service
- Crossing over the entire I-5 freeway to the west side near 212th Street SW can be accomplished more directly and on shorter, less expensive structures than with the split crossing required in some other alternatives

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Markedly increased due to higher visual and ecosystem impacts along the west side from 185th, and higher visual, ecosystem, and potential noise impacts, including for the transition to the east side and along the eastside greenbelt to the north.
Development Potential	Similar
Cost Implications (2010$ M)	$110M to $140M more
Constructability	Substantially more difficult, due to additional crossing of I-5
ROW Implications	Moderate increase in need for additional properties outside of I-5 ROW.

C1: 52ND AVE W TO 200TH STREET STATION

Guideway: From 212th Street SW, the guideway would turn north along the east side of 52nd Avenue W on elevated guideway and then turn east along the south side of 200th Street SW to a terminal station east of 48th Avenue W. The guideway would extend 700-1,000 feet beyond the station to provide trail track space to turn around and park trains that are out of service.

Stations: an elevated terminal station would be located on 200th Street SW east of 48th Avenue W, approximately two blocks north of the Lynnwood Transit Center. Up to 500 park and ride stalls would be added at the adjacent ~1,400 stall Lynnwood Park and Ride lot, and the Lynnwood Transit Center and on-street bus facilities would be expanded if necessary.

Relative pros and cons of this alternative:

- This station site is closest to the Lynnwood City Center and the alignment is well situated for future extension to the north along the Alderwood Mall Parkway corridor.
- Passengers transferring between the rail station and bus transit center would have a two block walk
- This alignment alternative would directly impact Scriber Creek park and multifamily residences along 200th Street SW
- Elevated guideway along 200th Street SW could be a barrier to development of adjacent properties

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Slight increase due to station proximity to a higher level of population and employment.
Potential Environmental Effects	Higher noise and visual impacts due to longer sections adjacent to residential areas. Higher potential for property impacts, including to multifamily residential areas. Reduced park and ecosystem impacts but direct impacts remain.
Development Potential	Similar
Cost Implications (2010$ M)	$22 to $29 More
Constructability	Improved due to shorter wetland crossing and accessibility from the local roads
ROW Implications	Higher impacts, including to multi-family residential complex, but avoids Edmonds School District property.

C2: 52ND AVE W TO LYNNWOOD TRANSIT CENTER STATION

Guideway: From 212th Street SW, the guideway would turn north along the east side of 52nd Avenue W on elevated guideway and then turn east along the 202nd Street SW right-of-way along the south side of Scriber Creek Park to a terminal station at Lynnwood Transit Center. The guideway would extend 700-1,000 feet beyond the station to provide space to turn around and park trains that are out of service.

Stations: An elevated terminal station would be located adjacent to the south edge of the Lynnwood Transit Center. Up to 500 park and ride stalls would be added at the adjacent ~1,400 stall Lynnwood Park and Ride lot, and the Lynnwood Transit Center and on-street bus facilities would be expanded if necessary.

Relative pros and cons of this alternative:

- This station site is adjacent to the Lynnwood Transit Center and would provide the most convenient bus-rail transfers.
- Future extension of the line to the north would likely impact hotel(s) east of 44th Avenue W
- This alignment alternative would pass near Scriber Creek park and multifamily residences along 202th Street SW, and would cross a major wetland complex

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar
Ridership Potential	Similar
Potential Environmental Effects	Similar, with reduced effects in several areas. Avoids impacts to Edmonds School District property, but could displace other commercial uses. Increased visual and noise impacts and similar to slightly reduced park and ecosystem impacts.
Development Potential	Similar
Cost Implications (2010$ M)	$7 to $10 More
Constructability	Slightly improved due to shorter wetland crossing
ROW Implications	Higher Impacts

C3: I-5 TO LYNNWOOD PARK & RIDE STATION

Guideway: From 212th Street SW, this alternative would cross over I-5 and parallel the north side of I-5 on elevated structure and cross over the Lynnwood HOV direct access ramp, then turn northeast to a terminal station in the Lynnwood Park and Ride. The guideway would extend 700-1,000 feet beyond the station and over 44th Avenue W to provide space to turn around and park trains that are out of service.

Stations: An elevated terminal station would be located in the southeast corner of the Lynnwood Park and Ride lot. Up to 500 park and ride stalls would be added to the ~1,400 stall Lynnwood Park and Ride lot, and the Lynnwood Transit Center would be re-located closer to the rail station and expanded if necessary.

Relative pros and cons of this alternative:

- This alternative has the shortest and lowest cost guideway, but has higher costs associated with relocating the Lynnwood Transit Center.
- This alternative has the fewest potential environmental impacts because it is located away for residential properties, has the shortest wetland crossing and avoids impacts to Scriber Creek Park.
- Future extension of the line to the north would likely impact hotel(s) east of 44th Avenue W

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Similar, although lower pedestrian access due to longer walk distances from residential and mixed use areas to the north and east.
Ridership Potential	Similar
Potential Environmental Effects	Lower. Generally avoids the wetland, stream, visual, and noise impacts of the AA alternative. Avoids some potential displacements, but could affect one to two more commercial uses.
Development Potential	Similar
Cost Implications (2010$ M)	$27 to $33 More
Constructability	Slightly improved due to shorter wetland crossings but more difficult over direct access ramp and 44th Ave. W.
ROW Implications	Reduces overall number of affected properties although some larger commercial properties could still be affected.

INTRODUCTION

From September 30 to October 31, 2011, Sound Transit (the Central Puget Sound Regional Transit Authority) and the Federal Transit Administration (FTA) conducted public scoping for the North Corridor Transit Project Environmental Impact Statement (EIS). Sound Transit is proposing the North Corridor Transit Project to connect to the regional light rail system in the Northgate neighborhood of Seattle, with alternatives to extend light rail northward to the cities of Shoreline, Mountlake Terrace, and Lynnwood.

Scoping supports the environmental review process requirements of the National Environmental Policy Act (NEPA) and the State Environmental Policy Act (SEPA). FTA and Sound Transit have determined that the project has the potential to result in significant environmental effects, and an EIS is needed. Scoping allows the public, agencies, and tribes to learn about and provide comments to help guide the EIS review for the proposed project.

This Scoping Summary Report summarizes the scoping process and the comments Sound Transit and FTA received. Sound Transit and FTA are considering the comments as they identify the range of alternatives and potential environmental issues to be evaluated in the EIS.

NORTH CORRIDOR TRANSIT PROJECT OVERVIEW

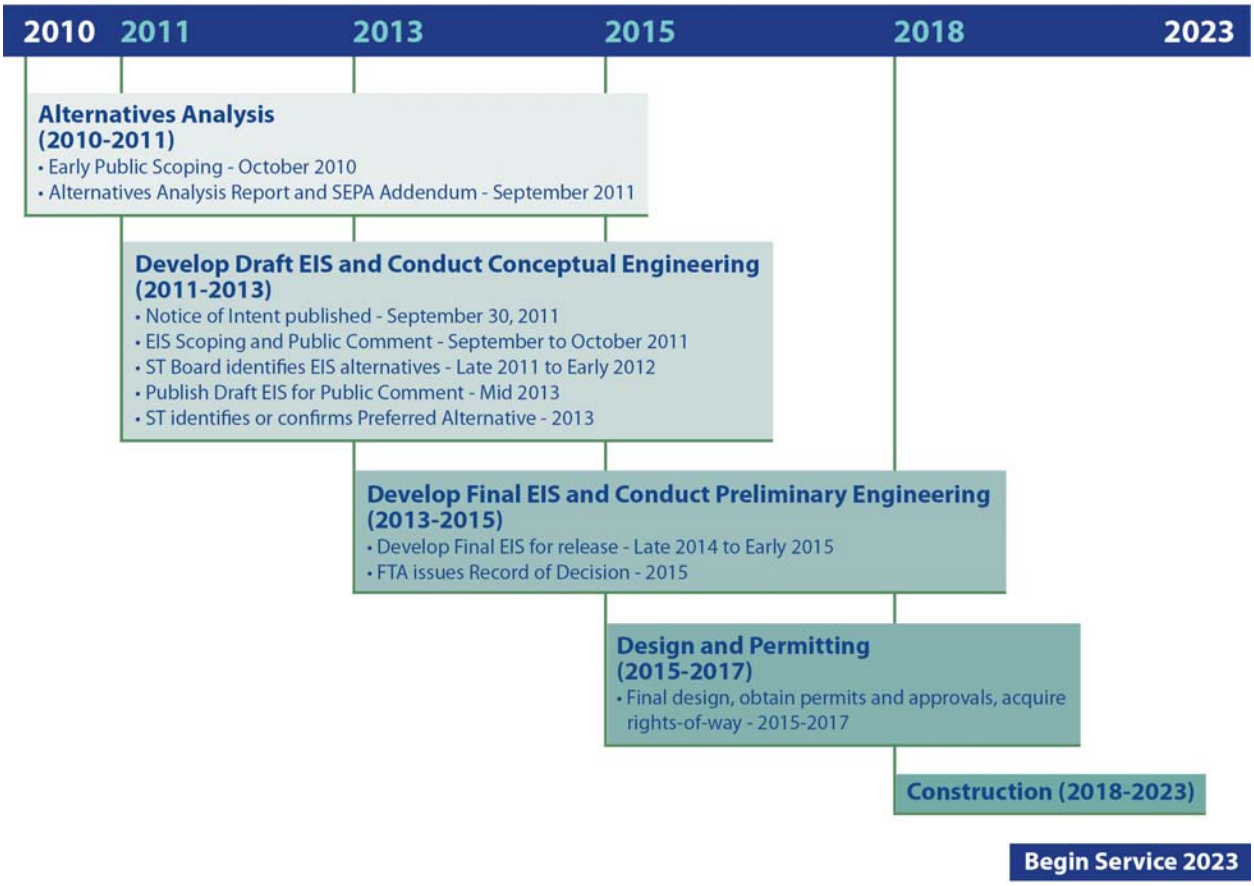
The North Corridor generally follows I-5 between Northgate and Lynnwood. While it is the major north-south route through the state of Washington, I-5 also serves a large commuter market between Snohomish and King counties and the City of Seattle. The corridor falls within an urban area that is constrained by Puget Sound to the west and Lake Washington to the east. There is a large north/south commuter market in this area that travels between the communities in Snohomish and King Counties, toward Seattle or north to Everett, where many of the region's jobs are located.

The North Corridor Transit Project is an element of Sound Transit's adopted Long-Range Plan and is part of the ST2 Plan for regional transit investments approved by voters in 2008. The project is also in the region's Metropolitan Transportation Plan (Puget Sound Regional Council's *Transportation 2040*). All of these plans anticipate the eventual extension of mass transit service north to Everett, connecting to a regional system serving other markets to the south, such as University of Washington, Capitol Hill, downtown Seattle, and SeaTac.

The start of the EIS phase for the North Corridor Transit Project is building on the results of an Alternatives Analysis Sound Transit performed in 2010-2011 that included early public and agency scoping in October 2010. The Alternatives Analysis developed and evaluated a range of alternatives to improve transit in the corridor, and resulted in an Alternatives Analysis Report and SEPA Addendum that identified the most promising alternatives for further study. The Alternatives Analysis also served as an addendum to Sound Transit's Supplemental EIS on the Regional Transit Long-Range Plan (June 2005).

Figure 1 shows the overall schedule Sound Transit expects for the North Corridor project, from the initial planning and environmental review steps through to final design and construction, leading to the planned start of transit service in 2023.

Figure 1. North Corridor Transit Project Schedule



The Scoping Process

The NEPA and SEPA scoping process began with formal notices to prepare an EIS, accompanied by advertisements and other public notices and outreach materials. For NEPA, a Notice of Intent (NOI) to prepare an EIS was published in the Federal Register on

September 29, 2011. For SEPA, a scoping notice was published in the State's SEPA register on September 30, 2011. Sound Transit also provided links to the notices at www.soundtransit.org/NCTP.

The scoping comment period was held from September 30 to October 31, 2011. During this time, Sound Transit and FTA asked the public to provide comments on the proposed purpose and need statement, environmental issues for evaluation in the EIS, and the alternatives being considered for study in the draft EIS.

Scoping was conducted by Sound Transit and FTA in consultation with other agencies, including the Washington State Department of Transportation; Federal Highway Administration; the cities of Seattle, Shoreline, Mountlake Terrace, Edmonds, and Lynnwood; King and Snohomish counties; Community Transit; affected tribes; and other regional, state and federal agencies. The scoping approach was also developed to be consistent with FTA's regulations for implementing NEPA, as defined in 23 CFR 450.318(b)(2)(iv).

Notices and Advertisements

In addition to the formal EIS scoping notices, Sound Transit and FTA used several other public notice and involvement tools to notify and engage the public and agencies during scoping:

- Direct mail postcards to approximately 103,000 addresses in the corridor (with translated information also provided)
- Email notices on September 30 and October 6, 2011 to more than 1,000 addresses
- Advertisements in the Seattle Times and other print and online media
- Printed posters and postcards dropped off at many public locations in the corridor (such as at libraries, city halls, and community centers)
- Notices on Sound Transit's project website at www.soundtransit.org/NCTP, accompanied by a Scoping Information Report (September 2011)

The print advertisements were placed in the Seattle Times and local North Corridor area newspapers announcing the upcoming public meetings. Advertisements in print and online publications, along with a number of media stories, were published by:

- tu Decides
- Snohomish County Business Journal
- Publicola
- Seattle Transit Blog
- MLT News
- Shoreline News
- The Herald
- Progressive Railroading
- The Weekly Herald
- My Edmonds News

To help reach a full range of community members, meeting notification materials were translated into Spanish, Russian, traditional Chinese and Korean. Sound Transit also placed notices in online blogs, Sound Transit's Twitter feed, and Sound Transit's Facebook page. Staff prepared press releases to generate news articles to further create awareness about the project and its public involvement opportunities.

In addition, Sound Transit staff met with seven organizations and elected bodies (city councils) in the project area before or during the scoping period. During the scoping period, Sound Transit also conducted a live-streamed online panel discussion called "Tech Talk" on October 7th, which was focused on the results of the Alternatives Analysis. Tech Talk was a moderated discussion of comments and questions raised by on-line participants. The discussion covered the project background and schedule, the findings of the project's Alternatives Analysis, and the merits and attributes of potential light rail alternatives. It also covered issues such as land use, transportation performance, design, and environmental effects. This informational session was advertised by email (September 30 and October 6, 2011) and on local area transportation-related blogs. During the session, Sound Transit staff also encouraged the participants to attend the public scoping meetings and submit formal comments.

Background Materials

To provide additional information about why Sound Transit is proposing the North Corridor Transit Project and how the EIS will be conducted, the agency produced the following publications and made them available on the project website and at public meetings prior to the start of scoping:

- *Scoping Information Report:* a summary of the current environmental scoping effort, which provides a planning history of the project, the results of the recent Alternatives Analysis, the draft purpose and need statement, the range of alternatives being considered for study in the EIS, the potential environmental topics to be reviewed in the EIS, and the project schedule.
- *Draft Coordination Plan*: a summary of the plan to engage the public, agencies and tribes throughout the environmental review process.
- *Alternatives Analysis Report and SEPA Addendum*: a summary document and complete technical report describing the initial study Sound Transit conducted to define the most promising alternatives now being considered for further review in the EIS, along with alternatives to be dropped from further consideration.

Public and Agency Scoping Meetings

Three public meetings and one agency meeting were held during the scoping period. More than 240 people attended the public meetings. Staff from thirteen of the 40 invited agencies and tribes attended the agency meeting.

Public Meetings		
October 11, 2011 6 p.m. - 8 p.m.	Shoreline Conference Center 18560 1st Avenue NE Shoreline, WA 98155	100 (86 signed in)
October 13, 2011 6 p.m. - 8 p.m.	Embassy Suites 20610 44th Avenue W Lynnwood, WA 98036	55 (43 signed in)
October 18, 2011 6 p.m. - 8 p.m.	Ingraham High School 1819 N. 135th Street Seattle, WA 98133	30 (26 signed in)
Agency and Tribal Meeting		
October 11, 2011 2 p.m. - 4 p.m.	Shoreline Conference Center 18560 1st Avenue NE Shoreline, WA 98155	13 agencies

Public Meetings

The public meetings used an "open house" format combined with a presentation and Question and Answer session. Each meeting had a sign in area, a comment area, and information stations with display posters and background written materials (such as the project's *Scoping Information Report*, *Alternatives Analysis Report and SEPA Addendum*, and fact sheets). There were also several interactive stations to help the public note specific areas of the corridor. Each station had project staff to answer questions and listen to participants.

In the presentations, Sound Transit and FTA staff described the project and its history to date, and took questions from the audience. Some of the more common topics were:

- Station locations
- Park and rides
- Service levels
- Elevated versus surface sections
- Federal funding
- Project schedule
- Alternatives Analysis findings
- Bus service, including east-west connections
- Ridership
- Land use plans and transit-oriented development
- Economic and environmental impacts

Agency Meeting

The agency meeting had a similar format to the public meetings, but was designed to help agencies and tribes identify their level of interest and future involvement in the EIS process as the project moves forward. (There are additional federal requirements guiding how agencies and tribes are to be engaged in the EIS process, as described in the project's *Draft Coordination Plan*.) Thirteen agencies attended the agency scoping meeting. See Attachment B for a list of attendees.

SUMMARY OF COMMENTS RECEIVED

From September 30 through October 31, 2011, Sound Transit and FTA received 69 comment submittals from individuals, 14 comment submittals from jurisdictions and agencies, and 3 from organizations.

The majority of the comments Sound Transit and FTA received were positive.

All the jurisdictions, agencies and organizations with written comments either supported the proposed project or offered advice on the project's next steps into the environmental process. None of these parties were opposed to the proposed project.

Seven of the agencies and jurisdictions specifically indicated support for an I-5 alternative, as did all of the organizations that commented.

One agency (King County Department of Transportation) supported carrying a SR 99 alternative and an I-5 alternative into the EIS, primarily because of the potential differences in transit-oriented development potential for the alignments. (After the close of the comment

period, the King County Department of Transportation wrote an additional letter noting its preference for an I-5 alternative.)

Several other agencies, including the cities of Seattle, Edmonds, Lynnwood, Mountlake Terrace, Everett, and Community Transit, noted concerns about a SR 99 elevated alternative's impacts, costs, ridership or ability to meet other purpose and need objectives.

More than 75 percent of the public's (individuals) comments supported the proposed project or one or more of the light rail alternatives Sound Transit and FTA are considering for the EIS.

About 45 percent of the commenters expressed support for a specific alignment, including one or both of the alternatives.

From all general public comments, about 35 percent supported an I-5 light rail alternative, while 3 percent were opposed.

About 13 percent supported a SR 99 light rail alternative, and 7 percent were opposed.

About 5 percent (or 3 of the commenters) were opposed to the proposed project, including one party who preferred Bus Rapid Transit instead of light rail. The remaining 21 percent did not indicate a clear preference or focused on environmental or other issues.

The other comments varied, but included suggestions about route or station locations, environmental or land use factors, and the purpose and need for the project. A number of commenters asked for Sound Transit to move ahead more quickly to build the project.

Comments from the General Public

During the scoping period, Sound Transit and FTA received 69 comments from members of the public through written forms at the public meeting, the online form, email, or direct mail.

Fifty-two of the comments indicated general support for the project. Twenty-four expressed support for the I-5 alignment, while eight supported the SR 99 alignment.

Three individuals opposed the project as a whole. One person opposed Sound Transit in general and the potential for new taxes, stating that light rail has not been cost effective. Two people who opposed light rail, expressed support for a bus system or bus-only lanes.

The 17 comments supporting an I-5 alignment focused on travel time benefits, the problems of congestion, and the need for enough parking to meet demand.

The two comments opposed to an I-5 alignment suggested the project's focus should be on creating more opportunities for transit-oriented development and related environmental benefits, including energy savings and reduced greenhouse gas emissions. They believed SR 99 offered more potential for this, while I-5 offered less or no potential.

The eight comments opposed to an SR 99 alignment noted the environmental impacts of construction, particularly economic impacts to businesses, but they also cited cost as a factor.

Many of the remaining comments from the public provided general opinions about the proposed project and its purpose, suggestions about the alternatives, and primary areas of environmental concern, including wetlands, noise and vibration, visual impacts and construction.

There were only a few comments about the project's "purpose and need", which is the formal statement of why the project is proposed and why Sound Transit believes it is needed. However, a number of commenters described why they supported the project and how they expected to use it. A summary of these comments is provided below.

General Project

- Project schedule is too long
- Adequate commuter parking must be included; some park-and-rides already at capacity (for instance, Lynnwood Transit Center)
- East/west transit service is important to get commuters to light rail stations
- At-grade trains are slow trains, so ours must not be at-grade
- Need good light rail service all day, not just commuter times
- Will coach amenities include tables and outlets, comfortable seats, and safe standing room?
- Initial train service was minimal, parking was minimal, and travel time was excessive
- Travel efficiency and cost are most important considerations
- Prefer route with more car parking and stations
- Consider Shoreline's "town center" density plans and how that would affect ridership forecasts
- Make sure stations are walkable and accessible, including some with no parking
- The project should emphasize benefits to transit-oriented development, walkability, community equity, environmental and other factors, in addition to transportation

Suggestions about Alternatives

- Add station at 130th to I-5 alignment
- Reconsider stations that offer better walkability than those just along I-5 interchanges
- Reconsider stations at 15th/145th and 15th/175th stations that offer better walkability and transit-oriented development (TOD) than those along I-5
- Lynnwood Transit Center access needs modification, and needs more walkable areas – hard to access in SOV
- Light rail should extend to Alderwood Mall, Lynnwood Convention Center, and Lynnwood City Center

- Place a walkable, accessible station closer to Lynnwood City Center or Alderwood Mall
- Extend as far north as possible, such as to Ash Way to serve more commuters and reduce traffic at Lynnwood
- Use Interurban Trail land for alignment; already paid for and dedicated for transit
- 220th & SR 99 should be served; highest residential and employment density in south Snohomish County
- Northgate park-and-ride should be rebuilt in manner of Hammersmith Station in London, with better connections, mixed uses, and amenities
- Extend SR 99 alignment into Edmonds/Lynnwood with some combination of 208th, Interurban corridor, and 200th St to Lynnwood transit center
- Look at placing SR 99 alignment diagonally through NW Hospital campus to reduce travel distance.
- Consider different Shoreline station location; such as at the Shoreline Park-and-Ride, near 185th, and near the urban villages identified by the Shoreline community. Stations should emphasize walk up, bike up, and transfers, not huge parking lots
- Place pedestrian-only stop near I-5 & 196th to be consistent with Lynnwood's City Center Plan
- Park-and-rides should have: bus stops, bicycle spaces, electric vehicle outlets, camera monitoring for security, snack bar, restrooms, alternative energy for power needs, pay phone
- Consider staggered stops; run more trains but skip some stations
- SR 99 alignment should be placed on west side of road
- Consider a mix of Express Bus on I-5 between Lynnwood and Northgate, linked to a limited stop light rail route using SR 99 to connect Lynnwood to Northgate

<u>Concerns about Impacts</u>

- Noise, traffic, parks and visual impacts from light rail along I-5, where noise and traffic impacts are already high
- Parking impacts if stations do not provide enough parking, especially in areas where demand already exceeds supply
- Impacts to businesses along a SR 99 alignment, including displacements and loss of business (also noted as reasons a SR 99 alternative should not be studied further)
- Impacts in Lynnwood due to increased traffic and pedestrians
- General project impacts on residences, but especially noise, visual, changes to sound walls or access
- Noise and vibration impacts on residences
- Property acquisition process questions
- Streams and wetlands adjacent to I-5, including at NE 145th Street, near Mountlake Terrace, and near Lynnwood

- Wildlife – preserve greenbelts and/or avenues used to navigate the area
- Impacts of increased pressure for growth around station areas, with further impacts to the remaining natural areas

Purpose and Need

- Include TOD and environmental benefits as a key purpose of the system
- Endorse community equity and benefits elements to low income and minority populations as part of the project purpose
- Endorse the need for improvements to travel time, speed, reliability for transit riders

Comments from Agencies and Jurisdictions

Fourteen agencies provided comments during the scoping period. This included nine local jurisdictions (city or county governments or districts), a transit agency, one regional agency, one state agency, and two federal agencies.

Local Jurisdictions

City of Edmonds

The City's letter discussed the Alternatives Analysis and voiced general support for the project. The letter noted the City may later indicate a preference for an alignment alternative. However, if a SR 99 alternative is included in the EIS, the City would want to have the option for a route to continue along SR 99 north of 205th/244th Street into the City of Edmonds. (After the close of the comment period, the City provided an updated letter identifying I-5 as their preferred alternative.)

City of Everett

Everett's letter encouraged including an I-5 light rail alignment in the EIS. The letter noted concerns with SR 99 impacts, including business disruption, higher costs, lower ridership, and lack of connection to existing transit facilities investments such as at NE 145th Street. The City encouraged Sound Transit to select an alignment that would support light rail to Snohomish County and Everett, with the least cost, highest ridership, and best chance for receiving federal funding.

City of Lynnwood

The City noted its longstanding support for the North Corridor project and a regional transit investment to connect to the city center as a regionally designated growth center. The City included its adopted resolution endorsing an I-5 light rail alternative, noting overall transportation and environmental performance and cost effectiveness. The City also identified concerns with a SR 99 alignment, including lower overall benefits, higher costs, conflicts with Bus Rapid Transit investments, impacts, and delays or conflicts with future plans

to extend service to Everett. The City noted its interest in a future station closer to the core of the city center area. Lynnwood also provided comments for the EIS's treatment of impacts, including construction, parks, and property acquisitions.

City of Mountlake Terrace

Mountlake Terrace's letter voiced continued support for placing light rail along the I-5 corridor, and encouraged Sound Transit to identify an I-5 light rail alternative as a preliminary preferred alternative. It also identified concerns for the higher costs and impacts of a SR 99 alternative. The letter noted the I-5 alternative's ability to achieve the greatest number of riders at the smallest capital cost, and endorsed the general findings of the Alternatives Analysis. The City also noted the importance of a light rail investment to its vision for creating a vibrant, mixed use area within walking distance to a future light rail station near I-5 and 236th Street SW, and identified its own planning and environmental efforts toward creating transit-oriented development nearby.

City of Seattle

The City's letter voiced support for the project's proposed purpose and need statement and acknowledged Sound Transit's coordination with corridor jurisdictions during the Alternatives Analysis. The City concurred with the Alternatives Analysis findings, and supported limiting the range of alternatives to an I-5 light rail alternative and a no-build alternative if Sound Transit identifies an I-5 light rail alternative as the locally preferred alternative.

City of Shoreline

The City of Shoreline provided a detailed letter attaching its scoping comments on impacts and issues for Sound Transit to consider in the EIS, along with adopted Guiding Principles the City plans to use for its own decisions about light rail. The letter indicated that the Shoreline City Council will be identifying its preference for a specific alignment later in November, but they were very supportive of the proposed extension of light rail to Shoreline. The City's Guiding Principles include transportation, land use, economic, social, cost and impact considerations. The City's scoping comments addressed issues such as potential alignments and station locations (including studying a potential station at I-5/NE 185th Street on the west side of I-5), costs, travel times, ridership, access (including avoiding or upgrading bike/pedestrian crossing the freeway at NE 195th Street), social equity, land use, and transit feeder service. It also discussed noise, visual and traffic impacts and mitigation measures. (The City also provided a similar letter to the Chairman of the Sound Transit Board. After the close of the scoping period, the City wrote an additional letter to inform Sound Transit and FTA that the City Council had identified the I-5 alignment as the City's preferred alignment.)

Lynnwood Public Facilities District

This City development district encouraged Sound Transit to site a station within walking distance of the Lynnwood Convention Center and noted the importance of the center to the economic vitality of Lynnwood.

County and Regional Agencies

Puget Sound Regional Council

The regional council provided a detailed letter noting the importance of high capacity transit to the region's integrated strategy for growth management, transportation and economic development. The letter suggested additional factors to consider for the purpose and need and related objectives, including the ability to focus growth to create walkable, compact and transit-oriented communities and to support regional growth and activity areas. In addition, PSRC provided comments on the scope of EIS alternatives and analysis, including ways to measure access by mode, a variety of station sites and attributes, and the identification of potential mitigation measures.

King County

The King County Department of Transportation provided scoping comments on the purpose and need, range of alternatives, environmental factors and potential project evaluation criteria. The County suggested expanding the project's purpose to include providing a catalyst for desired growth, such as walkable, transit-oriented communities. The County's comments on alternatives supported including both the I-5 and the SR 99 alternatives. The letter suggested a range of alternatives was needed to help weigh the balance between leveraging existing transportation investments against the different types of land use along an I-5 versus a SR 99 alignment. The County's comments on alternatives recommended evaluating both I-5 and SR 99 in the EIS, and a range of alternative station locations along SR 99.

For the I-5 Alternative, the County suggested station locations should be evaluated at NE 155th Street and NE 130th Street. (After the close of the comment period, the County wrote an additional letter noting its preference for an I-5 alternative because of the I-5 alignment's higher ridership, lower cost, and because it would complement the County's and Community Transit's investment in bus rapid transit service on SR 99. King County stated they plan to implement the RapidRide E line on SR 99 between downtown Seattle and the King/Snohomish counties in 2013.)

For the SR 99 Alternative, the County suggested possible station locations should be evaluated at:

- NW Hospital at N 115th Street
- N 130th Street

- N 145th Street
- N 160th Street
- N 175th Street
- N 185th Street
- Shoreline Park-and-Ride
- SW 216th Street, and
- SW 202nd Street

Snohomish County

Snohomish County's letter indicated overall support for the project but did not specifically endorse an alternative. The County suggested considering an array of factors in analyzing EIS alternatives, such as the ability to support long range plans to extend to Everett, travel time and ridership, number of stations, and regional service versus a local service focus. The letter also discussed station-area issues, including multimodal access (east-west transit access, and pedestrian and bicycle facilities), evaluating impacts to local land uses, park and ride capacity, and local land use effects.

Community Transit

Community Transit's letter thanked Sound Transit for engaging them in the Alternatives Analysis and emphasized their interest in fulfilling a shared vision for effective regional and local transit. The letter voiced support for the purpose and need and noted the importance of the regional investment to allow more of their resources to focus on connecting centers and feeding the regional system. The agency also supported the I-5 alternative because it best supports the purpose and need, and they identified concerns with the ability of SR 99 elevated light rail alternative to efficiently and cost-effectively meet future travel demand. The letter concluded with comments on the Alternatives Analysis report and Community Transit's services, facilities and plans.

State

Department of Archaeology and Historic Preservation

The Department wrote regarding its role under the National Historic Preservation Act and related federal regulation and asked for continued opportunities to be involved as the project develops.

Federal

Environmental Protection Agency

The EPA's letter was received from Region 10 in Seattle, and focused on environmental scoping and analysis issues and procedures. EPA provided a list of additional resources to

consider in developing methods and conducting the analysis. The agency offered suggestions on areas such as indirect and cumulative effects, water quality, aquatic resources, climate change, ecosystems, air quality, Environmental Justice, endangered species, tribal consultations, historic properties, and human health.

Advisory Council on Historic Preservation

The Advisory Council acknowledged the invitation to participate in the EIS, offered general guidance for the project's review of historic resources effects, and noted its ability to participate in the project later if impacts to historic resources are identified.

Organizations

Snohomish County Committee for Improved Transportation

The Committee expressed support for light rail and the I-5 alignment. Cost and travel time are of particular interest to the organization.

Shoreline Chamber of Commerce

The Chamber of Commerce Board of Directors agreed to only support the I-5 alignment for light rail, noting they found it to be the best option for the businesses and citizens of Shoreline.

Snohomish County Infrastructure Coordination Committee

The Committee indicated that the I-5 alternative has clear advantages for the County, including cost, feasibility, and connections to regional centers. They also suggested that going into the EIS process with a preliminary preferred alternative will save time and money.

Project Correspondence Received After the Close of the Scoping Comment Period

After the close of the comment period (October 31, 2011), Sound Transit received additional letters from six parties addressing scoping-related issues. Several of these parties had submitted letters earlier during the comment period (City of Shoreline, City of Edmonds, and King County Department of Transportation) and wanted to provide updates or new information. While the scoping summary does not count these letters received after the end of the comment period as formal scoping comments, their key points are summarized below.

City of Shoreline

Following up on an earlier letter provided during scoping, the City of Shoreline wrote to inform Sound Transit and FTA that the Shoreline City Council had unanimously identified the I-5 alignment as the City's preferred alignment on November 14, 2011.

Washington State Department of Transportation

WSDOT provided a letter thanking Sound Transit for its coordination during the Alternatives Analysis and stating the concept placing light rail within the I-5 right-of-way would be a feasible alternative for further study in the EIS. WSDOT also emphasized the importance of ensuring safe access to and from light rail stations and avoiding adverse impacts to highway operations.

King County Department of Transportation

The King County Department of Transportation provided an additional letter to convey its support for the I-5 alternative identified in the Alternatives Analysis. The Department noted that its scoping period letter discussing both SR 99 and I-5 alternatives was focusing on strategies for improving the EIS if either alternative was chosen, and did not indicate a preferred alternative. The letter also described the benefits of the I-5 alternative, including its potential to complement bus rapid transit investments already being made along the SR 99 corridor.

City of Edmonds

The City supplemented its earlier scoping period letter with a letter to the Sound Transit Board conveying its support and preference for an I-5 alternative, based on the I-5 alternative described in the Alternatives Analysis. The City noted the 2008 public vote approving Sound Transit investments that included the light rail extension to Lynnwood and also identified the benefits of the I-5 alternative.

Edmonds School District

The school district wrote regarding its plans for three properties near the corridor and encouraged the project to develop alternatives that could avoid impacting the properties. While the District did not take a position on any of the alternatives under consideration, it stated that the properties were important components of its long-range property plan approved by voters in 2006. The District's properties include land to be developed as a District Support Site, located south of the Lynnwood Transit Center; the "Melody Hill" site located on the southwest corner of I-5/SW 220th Street SW in Mountlake Terrace; and the Evergreen Elementary School site at 236th Street SW in Mountlake Terrace. The District noted the latter two properties were important for revenue generation for the District's capital program.

Aurora Avenue Merchants Association

The association, which represents 515 business members located along SR 99 between 65th Street NW and 145th Street NW, wrote to express support for an I-5 light rail alignment and opposition to a SR 99 alignment. The association noted costs, travel time, environmental

impacts, and construction and community disruption impacts as key factors behind its position.

NEXT STEPS

Identifying the Draft EIS Alternatives and the Scope of the EIS – The public and agency comments received during scoping will help Sound Transit (at the direction of the Sound Transit Board) and FTA finalize the purpose and need for the project and identify the issues and alternatives to be considered in the Draft EIS.

In late 2011 or early 2012, the Sound Transit Board is expected to consider a motion to provide direction on the range of alternatives to be studied in the Draft EIS. The consideration of any motions will be conducted in regularly scheduled meetings of the Board and will be open to the public.

Draft EIS – Upon direction of the Sound Transit Board and in consultation with FTA, work on the Draft EIS is expected to begin in early 2012. The Draft EIS will take about 12 to 18 months to complete and issue for public and agency review, leading to publication in about mid-2013. The Draft EIS will be available for a minimum 45-day public comment period that will include public hearings.

After the close of the Draft EIS public comment period, the Sound Transit Board will consider public comments as well as the information in the Draft EIS when it identifies the preferred alternative for the Final EIS.

Final EIS – The Final EIS will complete the analysis of the preferred alternative along with the other proposed build alternatives and No-Build Alternative, and it will respond to the comments received on the Draft EIS. Work on the Final EIS is expected to begin in late 2013 with publication scheduled for 2014.

Record of Decision – After the publication of the Final EIS, FTA is expected to release a Record of Decision (ROD). The ROD documents findings by FTA that the project has met the requirements of NEPA and related environmental regulations. It describes the project, alternatives considered, the public opportunity to comment, the public comments and responses, the basis for the decision to approve the project, and mitigation measures required.

Attachment A – Parties Providing Scoping Comments

Scoping comments were received between September 30, 2011 and October 31, 2011 from the following agencies, organizations, and public individuals.

Federal Agency

Advisory Council on Historic Preservation (ACHP)

United States Environmental Protection Agency, Region 10 (EPA)

Attachment B – Agency Meeting Attendees

Agency Scoping Meeting
2:00 p.m. – 4:00 p.m.
October 11, 2011
Shoreline Conference Center

Attendees:

Name	Title	Organization
Allan Giffen	Director, Planning and Community Development	City of Everett
Tom Hingson	Director, Transportation Services	Everett Transit
Carrie Deichl	Environmental Protection Specialist	FTA
Dan Drais	Environmental Protection Specialist	FTA
Gil Cerise	Senior Transit Planner	PSRC
Janiene Lambert	City Center Program Manager	City of Lynnwood
Steve Butler	Director, Community Development	City of Mill Creek
Bert Hauss	Transportation Engineer	City of Edmonds
Stephen Clifton	Director, Economic Development	City of Edmonds
Liz Gotterer	Transit Planner	King County Metro
Mike Usen	Senior Transit Environmental Planner	King County Metro
Jay Larson	Transportation Specialist	Snohomish County
David True	Manager, Capital Development	Community Transit
June Devoll	Manager, Strategic Planning and Grants	Community Transit
Alicia McIntire	Senior Transportation Planner	City of Shoreline
Dylan Counts	Sound Transit Liaison	WSDOT

APPENDIX B

MARCH 2012 DROP-IN SESSION SUMMARY

Background & Summary

In March 2012, the North Corridor Transit Project outreach team and technical staff conducted outreach in the project area to engage residents about project progress. This outreach builds on a fall 2011 comment period, compliant with NEPA (National Environmental Policy Act) and SEPA (State Environmental Policy Act) scoping requirements and procedures. Since then, the Sound Transit Board identified the I-5 corridor route and light rail mode as the most promising for further study.

The North Corridor Transit Project will extend light rail from Northgate to Lynnwood, and is a component of the 2008 ST2 package approved by Puget Sound voters. To plan this route and seek competitive federal grant funding from the Federal Transit Administration, an Alternatives Analysis process (requirement of New Starts guidelines), was completed in 2011 to determine the corridor and mode for mass transit expansion beyond Northgate.

The next step is to determine alternatives for analysis in a draft Environmental Impact Statement. Between December 2011 and March 2012, the technical team completed preliminary work to explore alternative routes and stations. To "show our work" and explore these options with the public, the project team engaged in a round of outreach in March 2012, at ten casual, drop-in venues. Through this effort, the project team engaged in over 450 discussions in the project area.

Outreach Overview & Purpose

Ten drop-in sessions held between March 13 and March 24 provided an informal opportunity for the public to speak to members of the project team and ask questions related to I-5 alignment(s) and potential station locations. The sessions were held at locations across north Seattle, Edmonds, Mountlake Terrace, Shoreline and Lynnwood. The objectives of the drop-in sessions included:

- **Engage:** Provide an informal opportunity for the public to speak to members of the project team and ask questions.
- **Educate:** Provide Sound Transit and North Corridor Transit Project background information.
- **Update:** Provide information on project status and how input has informed corridor selection to date.
    - Explain I-5 selection as most promising alternative corridor.
    - Provide detailed information on potential station locations.
- **Get local:** Offer opportunity for input on exact station location, and offer opportunity for input on station access.
- **Go "where people are":** Host events in locations where Sound Transit could achieve the above objectives while residents were already out and about.
- **Identify:** How input will be used, next steps, the overall project schedule, and opportunity for public involvement.

Themes and Take-aways from Engagement

- Overall, there is general support and excitement, and growing knowledge of, the North Corridor project.
- Specific recommendations and preferences about potential station locations are taking shape. For instance, the N. 185th St. station area received the most comments as a single station. However, given the "either/or" options of N. 145th St. with N. 155th St. and either N. 125th St. or N. 130th St., that combination of stations elicited three times as many comments.

- There is general support of the I-5 corridor for alternatives, with minimal SR 99 commentary about why it's no longer an option or how the decision was made to look at I-5.
- Questions and concerns were common related to potential future transit-oriented development, pedestrian and bike access to stations, to make the route as successful as possible, or in contrast, due to neighborhood effects.
- Decision-making and timing is a personal topic. Participants asked questions about timing of decision making, construction and completion for personal decision-making and daily commutes. This was especially relevant to those participants who have concerns about real estate required for light rail construction.

Participation

Project team members engaged approximately **456** individuals over the course of the ten sessions.

Visitors to the sessions responded well to the casual meeting format and the opportunity to talk one-on-one with project staff. Anecdotally, approximately two-thirds of participants attended because they received a postcard or were notified in another way. However, these drop-in sessions also reached a wide spectrum of the community, that included those who might not attend a large public meeting. Occasionally, project staff received questions about the format, as some members of the public expected a formal presentation.

In addition to citizens, several elected officials and staff from local jurisdictions and agencies attended multiple sessions. These included representatives from Mountlake Terrace, Shoreline, Edmonds, Community Transit, Edmonds School District, and WSDOT.

A variety of input was received: **154 written** comments and an additional **100 verbal** themes noted by project representatives. Contact information was collected through comment forms and sign-in sheets, with **134** individuals added to the project GovDelivery email list to receive future project updates.

Notification

Postcard notice

A saturation postcard was mailed to approximately 41,300 single family homes, apartments and businesses, hitting mailboxes beginning on February 29. The general distribution area included a half-mile area around the I-5 corridor, from Northgate to the Lynnwood Transit Center, including some areas further to the east and west.

Bundles of postcards were dropped off at dozens of area locations with high foot traffic, based on organization and stakeholder research in the project area. Approximately 30 locations were hosted for postcard delivery two weeks prior to the drop-in sessions, including:

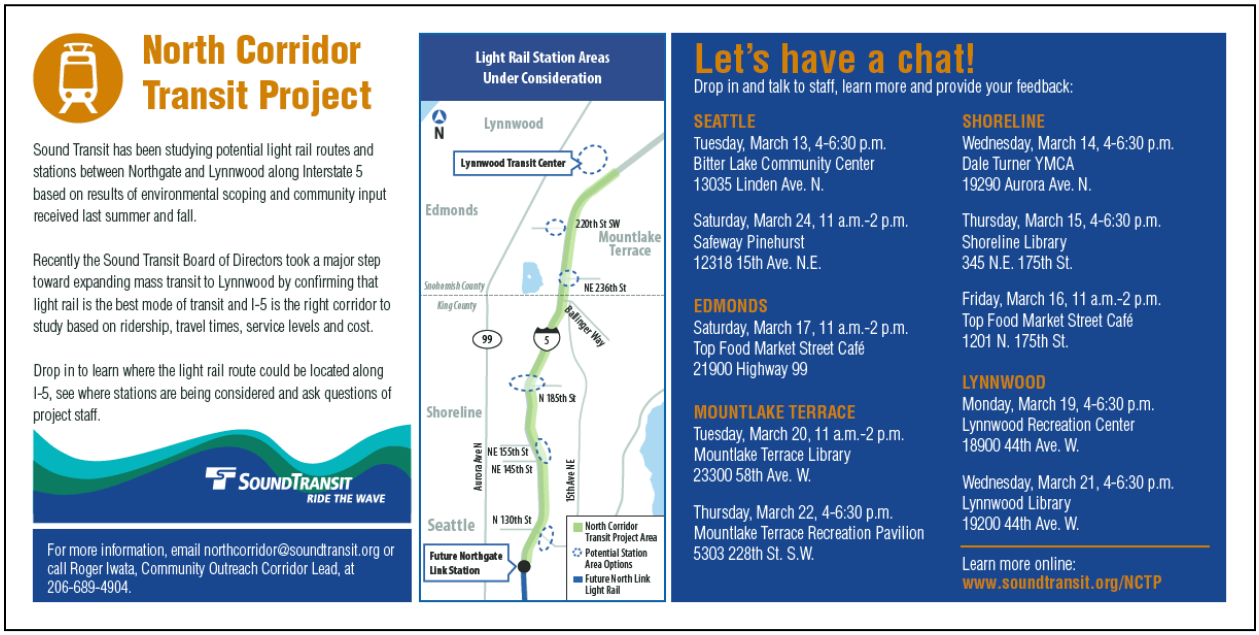
- Shoreline Senior Center
- Shoreline Recreation Center
- City of MLT Recreation Pavillion
- Alderwood Vocational Rehabilitation
- Northgate Community Center Alderwood Mall
- Alderwood Boys & Girls Club
- Plaza Latina
- North Seattle Community College
- MLT Library
- Northgate Public Library
- Lynnwood Community Services
- Dale Turner YMCA
- Safeway Pinehurst

- Roger's Marketplace
- Rancho Grande
- Korean Beef Soup
- European Food Store
- Jewel Box Café
- Ballinger Commons
- Shoreline Community Church
- Lynnwood Public Library
- H MART (Asian grocery)
- Community Health Center
- Top Food - Edmonds
- Top Food - Shoreline
- Bitter Lake Community Center
- Shoreline Library
- Lynnwood Recreation Center

Additionally, postcards were hung on community bulletin boards at the following locations:

- Starbucks Northgate
- Donut House Northgate
- Patty's Eggnest
- QFC Northgate
- Starbucks at 125th/15th
- Brown's Coffee House
- Starbucks SR 99/220th
- Garden Café
- Local Yolk
- Starbucks SR 99/205th
- Sky Nursery
- Safeway SR 99/155th
- Starbucks SR99/130th
- Starbucks SR99/185th

Drop-in session postcard



Community calendars

A community calendar announcement was e-mailed or posted when possible on the following calendars:

- Shoreline Patch
- Shoreline Currents
- Shoreline Area News
- City of Shoreline
- City of Everett
- City of Lynnwood
- City of Edmonds
- City of Mountlake Terrace
- Publicalendar (Publicola)
- Aurora Avenue Merchant's Association
- Snohomish County Tourism Bureau
- So. Snoco Chamber
- Everett Chamber of Commerce Snohomish County EDC
- Feet First
- City of Seattle calendar
- Tu Decides Calendar

Community blog display ads

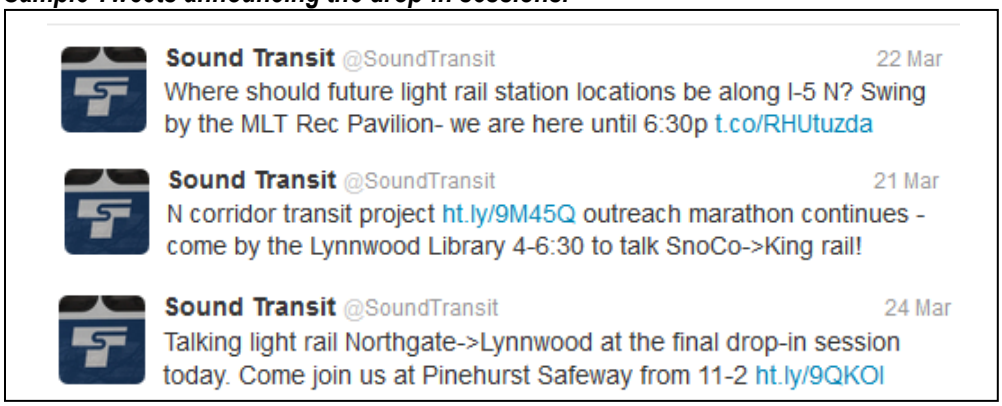
Ad space was purchased on local community blogs, including:

- My Edmonds News
- Lynnwood Today
- Seattle Transit Blog

Website, email and social media notification
Other notification tools were used, including:

- E-update to GovDelivery list (approximately 1,765 individuals)
- Sound Transit Twitter and Facebook pages (5,537 followers; 2,622 fans, respectively)
- Website updates (agency activities calendar and project website)

Sample Tweets announcing the drop-in sessions.



At least one participant visited as a result of the Twitter announcements.

Earned Media

The drop-in sessions garnered media attention outside of deliberate advertisements and calendar postings, with area media sources reporting on the project itself as well as the drop-in sessions. These included:

Articles (print/online)

- "Help Sound Transit Pick Light Rail Locations," Everett Herald, March 16, 2012
- "Light Rail Along I-5: Informational Meeting Coming Up Next Week," EdmondsPatch, March 7, 2012
- "North Corridor Meetings Start Tomorrow," Seattle Transit Blog, March 12, 2012
- "Extending light rail from Northgate to Lynnwood," Shoreline Area News, February 29, 2012
- "Reminder: More community drop-in sessions this week for northend light rail planning," My Edmonds News, March 18, 2012

News
Light Rail Along I-5: Informational Meeting Coming Up Next Week
The event will be held at Top Food & Drug in Edmonds.
By Patch Staff | Email the author | 5:20 am
Recommend Tweet 0 Email Print Comment
Sound Transit is encouraging community members to stop by Top Food & Drug in Edmonds next week to get a look at potential light rail station and alignment locations between Northgate and Lynnwood.
The event will be held March 17 from 11 a.m. to 2 p.m. at the Top Food Market Street Café, 21900 Highway 99.
The new light rail line that Sound Transit is preparing to build along the I-5 corridor is part of the Sound Transit 2 extensions to the north, east and south approved by voters in 2008.

Drop in Set-up and Venues

Drop in venues were set up similarly to fairs and festivals: targeted materials, with easy-to-maneuver layout and nimble infrastructure. Booths were placed in high foot traffic areas, with a layout intended to be simple, inviting and graphics-based with maps to generate discussion. Materials included:

- Table-top roll-plots showing overall route map and relevant station locations with post-its and markers to comment.
- Quick screen banners to catch people's attention in crowded areas, to pose a "What do you think" question, and identify the corridor and potential station locations.
- Project fact sheets and general Sound Transit service information.
- Four comment mechanisms:

    - ***Verbal comments*** were tracked by staff and summarized after each session.
    - ***Written comment forms*** were available and were the most popular method of commenting.
    - ***Written comments*** could be left on the roll-plot map to comment on specific locations.
    - ***Electronic comments*** could be made via an iPad, used several times as an alternative to the written comment form.
    - ***Email comments*** were also accepted.

The location of each drop in session was selected based on potential natural foot traffic, and proximity to potential station locations. Varying times (11 a.m.-2 p.m. and 4-6:30 p.m.) were used to coincide with busy times at each location and to accommodate varying potential attendee schedules. Drop-in sessions were hosted in locations where foot traffic was high in order to catch public attention without a formal invite.

Drop-in session locations, date and time

SEATTLE
Tuesday, March 13, 4-6:30 p.m.
Bitter Lake Community Center
13035 Linden Ave. N.

Saturday, March 24, 11 a.m.-2 p.m.
Safeway Pinehurst
12318 15th Ave. N.E.

EDMONDS
Saturday, March 17, 11 a.m.-2 p.m.
Top Food Market Street Café
21900 Highway 99

MOUNTLAKE TERRACE
Tuesday, March 20, 11 a.m.-2 p.m.
Mountlake Terrace Library
23300 58th Ave. W.

Thursday, March 22, 4-6:30 p.m.
Mountlake Terrace Recreation Pavilion
5303 228th St. S.W.

SHORELINE
Wednesday, March 14, 4-6:30 p.m.
Dale Turner YMCA
19290 Aurora Ave. N.

Thursday, March 15, 4-6:30 p.m.
Shoreline Library
345 N.E. 175th St.

Friday, March 16, 11 a.m.-2 p.m.
Top Food Market Street Café
1201 N. 175th St.

LYNNWOOD
Monday, March 19, 4-6:30 p.m.
Lynnwood Recreation Center
18900 44th Ave. W.

Wednesday, March 21, 4-6:30 p.m.
Lynnwood Library
19200 44th Ave. W.

Key Themes from Feedback

The following key themes were developed based on a qualitative analysis of discussions and comments from the drop-in sessions.

- Individuals frequently expressed general support and excitement about the project. Many comments and questions were **general in nature to the North Corridor project**. Participants asked a broad range of questions regarding timing of station choices, final design and completion.
- Participants also consistently asked questions related to station **parking**. Specifically at stations areas that currently lack adequate parking facilities, such as N. 145th St.
- Several participants had concerns regarding **bus and vehicle connections** to the stations and encouraged alternative transportation to stations by increasing **east – west** bus service.
- **Pedestrian and bike access** was another issue that generated comments. Commenters requested infrastructure, including sidewalks and bike lanes, be added near stations.
- Several comments related to increasing **development** around stations and ensuring station locations and transit provide access to local business districts and dense residential areas.
- In total, all comments related to access – parking, pedestrian, bus, east-west connections, and development – constituted over 80 specific comments, one of the more frequent themes.
- General questions related to Sound Transit's decision process also arose. Specifically, these came from residents located along the alignment and/or near potential stations expressing concern over **potential right-of-way acquisition**. Some of these residents, who are anxious about the process ahead, noted the location of their house on the roll-plot maps and provided input on their preference for station location and siting. They have questions and concerns related to timing and the property acquisition process. These property owners will continue to follow project progress.
- There was general **support of the I-5 alignment** with minimal commentary about SR 99 and why it is no longer an option.
- The roll-plot maps successfully facilitated a dialogue with participants about the project alignment and specific station locations. Many used the map to provide **input on station locations** and identify particular resources like parks, facilities, streams and topography. The most station-specific comments came in related to N. 145th St. vs. N. 125th/130th and N. 155th St. There is roughly an even split in preference between the two options. When mentioning N. 155th St., these commenters reflected a preference for N. 130th St. over N. 125th St.

Themes by Topic Area

Specific comments and themes are addressed below, including comments on specific station areas. All verbatim comments can be found in Appendix A.

General project questions and comments

The most frequent general topic of conversation surrounded general project questions and comments (45 total). Participants were generally very excited and supportive of the project. Questions primarily related to when the project would be operational, when the final alternatives would be ready, accessibility for elderly and handicapped, noise reduction measures and environmental impacts. Representative comments include:

- "Please do this as soon as possible! "
- "When will we have more info on the alternatives?"
- "Will it be elevated or at grade?"
- "How often will the trains run?"
- "The closer to existing park and rides and commercial the better."
- "Are you considering transit time in your evaluation?"
- "We'll use light rail all the time."
- "This process is moving too slow!"
- "I'm very excited about this project. When will it be open?"
- "Hooray for light rail to Lynnwood!"
- "This is exciting. I have a small home of 35th and 208th Pl SW. Looking forward to walking to transit center and taking fast transit to Seattle."

Parking Availability

Approximately 25 comments received related to parking availability. Many participants asked that there be ample free parking at stations, as other transit centers fill up quickly. Simultaneously, participants were concerned about parking overflow on neighborhood streets surrounding potential station locations. Representative comments included:

- "Please make sure there is parking near the transit stations."
- "The biggest concern is parking."
- "No land available for parking. People who can't drive to station won't ride the train."

East-West Bus and Vehicle Connections

Approximately 15 comments received were related to east-west bus and vehicle connections. Many comments related to ensuring reliable, frequent east-west bus connections from stations, and providing bus connections to key transportation points. Representative comments include:

- "Bus access to stations from E & W are key. Right now no service."
- "Cross town buses are too infrequent."
- "There should be buses running every 5 minutes running east-west along 130th St, 145th St, Northgate Way, etc."

Bike and Pedestrian Access

Approximately 15 comments received were related to bike and pedestrian access. Comments said it important to promote pedestrian and bicycle access to stations by adding infrastructure (sidewalks, overpasses, bike lanes, etc.) so stations can be accessed by means other than a car. Participants provided specific suggestions for locations for improved pedestrian access (included in specific station input below).

- "Consider pedestrian west to east of I-5 access to the light rail station."
- "Neighborhood needs pedestrian improvements in conjunction with station development (very few sidewalks). Also work with City of Shoreline for prioritizing city-funded sidewalks in neighborhoods."

Development around stations

Approximately 10 comments received were related to development around stations. Comments related to increasing transit oriented development and providing access to local business districts and dense residential areas. Representative comments include:

- "Stations should be designed in a way to include shops, stores, living spaces."
- "The development around the identified stations (Shoreline) will add to the economic growth of the community."
- "Can't we integrate stations into some sort of complex? A station by itself is a waste of space and land."

Property acquisition

At least 20 property owners adjacent to the project area attended the drop-in sessions and commented or asked questions. Shoreline drop-in sessions generated the most comments related to potential property acquisition.

Residents near alignment and stations have concerns about property acquisition and the uncertainty of station locations. There was a preference for stations that avoid property acquisition. Those in close proximity to the alignment have concerns about the impacts to property values. If property acquisition were required, there were concerns that assessed property values would be too low. Representative comments include:

- "Please ensure against situation similar to Seattle Monorail Project in Ballard. If lots acquired by eminent domain and the project is abandoned, displaced property owners should be given right of first refusal to re-purchase their lots at or below the amount they were paid."
- "When will properties be purchased?"
- "I would like to know that all our concerns about the land be given a serious thought and the consequences of progress not cost our homes."
- "Please stay on the current WSDOT right of way… Please leave homes alone*."*

General service information and other ST topics

Comments related generally to Sound Transit were also heard. A handful of visitors mentioned the independent study by James MacIsaac featured in the Weekly Herald (3/21/2012). Other comments included:

- "Reinstate bus routes between Lynnwood Transit Center and Northgate until project is complete."
- "Provide free parking at Northgate Station for all the local neighborhoods."
- "What will light rail do to help with parking at the already crowded Northgate area?"
- "Important to have security at all light rail stations."

- "Current seats on light rail are narrow and too hard."
- "The walk from the Sea-Tac station to the terminal is too far. Moving sidewalks should be installed."
- "Provide electric vehicle charging at stations."
- "What has been given back to the Shoreline community as a result of I-5 being built, bus barn at N. 165th St., and 15th Ave. N. condensed to two lanes? All of which has impacted the quality of life."

Themes by Station Area

The following comments summarize key themes and specific suggestions for each potential station location.

I-5 Route

Approximately 35 comments received were related to the I-5 alignment. There was general support of the I-5 alternative with minimal SR 99 commentary about why it's no longer an option or how the decision was made to look at I-5. Commenters expect the I-5 alignment to reduce traffic and congestion. Representative comments include:

- "The closer to existing park and rides and commercial the better."
- "There should be a pedestrian/bike bridge (over I-5 near Northgate)."
- "Alignment from Lynnwood to Downtown, and eventually Bellevue, will be very beneficial."
- "I'd love light rail on I-5."
- "I support the I-5 option, to consolidate traffic and minimize property impacts."

N. 125th St. Station Area

Approximately 25 comments received were related to this station area. Seattle drop-in session visitors were the most likely to offer a preference for this station in combination with a N. 155th. St. station, however overall, it did not show as preferable as N. 130th to commenters in terms of number of comments. Representative comments included:

- "This station would serve Lake City."
- "If we have N 125th St station area in further, it will help a lot of people in Northgate area especially patients going to Northwest hospital."
- "I highly suggest putting a LINK station on the east side of I-5 at 125th St or 130th St. I live in Pinehurst and feel it would add so much to the community, and basically enable me not to have a car."

N. 130th St. Station Area

Approximately 40 comments received were related to N. 130th St. Seattle drop-in session visitors were the most likely to offer a preference for this station in combination with a N. 155th. St. station. Comments said the area is generally more walkable and accessible from surrounding neighborhoods, including two urban villages, and the area has more land available for growth. Representative comments included:

- "N. 130th St. would be better than 145th--more land for growth around it."
- "N. 130th St. crosses I-5 and N. 125th St. does not…important for pedestrians and cyclists."
- "This station would serve Lake City."

N. 145th St. Station Area

Nearly 50 comments received were related to this station area. Shoreline and Seattle drop-in session visitors generated the most comments due to proximity to the station. Many thought the area would be a good spot for a station because of the many bus transfer stops, but there is also heavy traffic in the area. When commenting on 145th, there was a slight uptick of commenters stating a general preference for N. 145th St. station over N. 130th St./125th St. and N. 155th St. combination. However, those who preferred abandoning N. 145th stated the street is not pedestrian friendly, or that the area is already over-crowded with parking, so the potential station would need additional parking. They reflected that in general the existing park and ride facility generates commuters parking on neighborhood streets. Representative comments include:

- "N. 145th St. is too close to N. 130th St."
- "Arterial has potential for a transit corridor."
- "Station area is isolated from neighborhoods."
- "I prefer station at N. 145th St. - more function position and on a very active street and the location is very accessible."

N. 155th St. Station Area

Approximately 40 comments received were related to N. 155th St. Seattle and Shoreline drop-in session visitors generated the most comments. They reflected that the area is walkable and accessible from several neighborhoods east and west of I-5, and stated that N. 155th St. is also an important corridor for cyclists. Many said the N. 155th St. area is residential with slower traffic, however expressed a concern about the increased traffic a station would bring. Representative comments include:

- "No easement/right-of-way for station. Wet lands. Park."
- "No land available for parking."
- "A station at N. 175th St. would provide better connectivity to North City and Aurora."

N. 185th St. Station Area (East or West)

Approximately 50 comments received were related to N. 185th St. Shoreline drop-in session visitors generated the most comments due to proximity. There was split preference between east/west side locations. Regardless of location, many asked for the incorporation of pedestrian improvements in conjunction with station development. There is some concern among residents related to increased traffic in the area and commuters parking in surrounding neighborhoods. Commenters also conveyed that area is also an important corridor for cyclists. Representative comments include:

- "Shoreline Stadium/Shoreline Conference Center could be used for shared parking."
- "There isn't enough area to support the increase in traffic and the impact on the residents there would be very detrimental."
- "I'm thrilled at the prospect of a station on east side of freeway at N 185th—that would be within walking distance of my house and therefore would get frequent use by me."

Mountlake Terrace Station Area

Approximately 20 comments received were related to this station area. Most offered a preference for a station east of I-5 at the existing transit center. Several noted this is a good station location because it is best to couple multiple transit modes at one station.

- "Current station should be enclosed."
- "Create walkway west of Mountlake Terrace Transit Center to avoid N. 205th St./I-5/interchange."
- "Create walkway to businesses near 15th Ave. N.E. and Ballinger Way N.E."

220th St. S.W. Station Area

Approximately 10 written comments received were related to this station area, with Shoreline drop-in session visitors generating the most comments.

- "Suggest not including a station at N.220th St. and keeping the alignment as straight as possible."
- "This would serve Premera, which is the biggest employer in Mountlake Terrace."

Lynnwood Transit Center Station Area

Approximately 15 comments received were related to the Lynnwood Transit Center. Lynnwood drop-in session visitors generated the most comments due to proximity, however many Lynnwood comments were general in nature. Overall, this station likely did not generate many comments due to the assumption that the station will be incorporated into Lynnwood Transit Center in some form, and further analysis and design detail are required. Some commented that there should be easy access to the Alderwood Mall. There were some concerns about the potential station's proximity to wetlands.

- "Place station as far as possible from I-5 to increase walkability."
- "Put Lynnwood Station as close as possible to the transit center."
- "Will the Lynnwood station be located in the swamp?"

Next Steps

The technical team will use the input compiled in a variety of ways:

- In combination with technical analysis, recommendations will be made to the Board of Directors for alternatives for further study in the draft Environmental Impact Statement.
- Continuing to develop alternatives – route development.
- Continuing to develop alternatives – station location detail and access improvements that can be made by Sound Transit or coordinating agencies (cities, King County Metro and Community Transit).

The team will continue to engage the public in the project area as the project progresses. While the next "formal" comment period is the draft Environmental Impact Statement (expected in Spring 2013), this outreach proved successful in the North Corridor project area and provided the team with ideas for future outreach. Specifically:

- Going "where people are" allowed the team to have detailed conversations, yet simultaneously catch people who may not have heard of the project. The project will continue to seek these outreach opportunities through fairs and festivals and other venues at appropriate junctures.
- Scheduling additional organizational briefings with neighborhoods and other groups in the corridor to continue to gather feedback and educate people about the project.
- Collaborating with the technical and environmental team and Sound Transit Real Estate, when the team has new information to share, to determine a best time to engage direct neighbors of the project about potential property impacts.

APPENDIX A

North Corridor Drop-in Sessions: By the Numbers

Date	Location	# of Visitors	Sign-Ins	Comment Forms	iPad Comments	Verbal Comments Noted	Roll Plot

**Please note, while 154 total written comments were received during this outreach series. Any one of these comments could address multiple topics, as reflected above.*

APPENDIX B

Verbatim Comments

The following are comments received via comment forms, iPad online comment form, rollplot, and conversations with project representatives organized by drop-in session location.

Please note: Verbal comments are notations of comments heard, summarized by project representatives. Verbal comments should not be construed as verbatim comments, and could be repeats of general sentiments expressed in written comments received.

Source	Comment
Bitter Lake Community Center, Seattle Tuesday, March 13, 4-6:30 p.m.	
Comment Form	I think if we have N 125th St station area in further, it will help a lot of people in Northgate area especially patients going to Northwest hospital.
Comment Form	Biggest concern is ridership – hitting projected numbers. Please be sure to work with Metro, King County, Seattle, Snohomish County to increase east-west bus connections and to increase TOD/density. Hitting ridership numbers is imperative if we are to pass ST III.
Comment Form	I prefer a station at NE 130th St over NE 125th St because 130th crosses I-5 and 125th does not. Not important for drivers but important for pedestrians and cyclists, and presumably a future Metro bus route could travel on 130th to link with light rail service. Regarding the proposed station at 155th, it seems a station at 175th would provide better connectivity to North City and Aurora.
Comment Form	1. New multi living homes on east side of I-5, 2. Deep unsuitable material in 145th/5 NE, 3. Old garbage dump east side of I-5 at NE 165th St
Comment Form	I highly suggest putting a LINK station on the east side of I-5 at 125th St or 130th St. I live in Pinehurst and feel it would add so much to the community, and basically enable me not to have a car. Also, I would suggest some express trains from SeaTac to the North Seattle area (only stopping at a few major stops).
Comment Form	Please stay on the current WASH DOT right of way. Prefer station N of 130th at Park and Ride. Please leave homes alone. Prefer station at 145th.
Comment Form	N. 145th St station area is isolated from neighborhoods. N. 130th and 155th stations would be more walkable and accessible from several neighborhoods east and west of I-5. Having 130th and 155th (pair) provides a more pedestrian focus whereas 145th, a more drive to park and ride facility.
Comment Form	The I-5 route will destroy the Bitter Lake Urban Village. 145th St is NOT a good location for a station as it is very condensed already and there will be immediate pressure to create an urban village around the station (Roosevelt) which will make things even worse. No area for commuter parking here either (if Snohomish Co. can have HUGE commuter parking, we should be able to as well.
Comment Form	130th would be better than 145th--more land for growth around it, plus a good cross-city bus route to Bitter Lake and Lake City. The south side of 130th would be better than the north side, for greater walkshed.

Source	Comment
	Lynnwood: as far as possible from I-5 for greater walkshed.
Comment Form	I am very concerned about environmental issues, in particular the Thornton Creek Watershed. Please be careful of the system and wreak no further harm during construction. The creek system is a hallmark of NE Seattle and Shoreline as well. It also serves vital infrastructure functions. When the projects are finished the tributaries should also function on enhanced open space and greenbelts, more vital than before. Thank you!
Comment Form	I favor option 1 over 2, and 1a over 1b, that is, 155th over 145th, and 130th over 125th. 130th better serves both sides of I-5, and better serves transit, future if not present. 130th is on a direct route between 2 urban villages, making it ripe for an east-west bus route. 145th is too close to 130th making 155th better. 155th has more walkable destinations. 145th is too busy to be pedestrian friendly. --- I urge you to use some of your pedestrian/bicycle access funds and work with the city to create a sidewalk west of I-5 on Roosevelt, then 135th. This is the shortest route to Ingraham HS, but Roosevelt currently is muddy and/or unsafe for peds. This diagonal street can extend the "walkshed" to more blocks. Working with WSDOT to connect Roosevelt to 130th at I-5 with a ped. Path would be ideal, but is not necessary. --- Consider building the alignment level and straight so that an infill station can be added in the future to serve Northwest Hospital/Northgate North. --- I used to work near Ballinger Way and 15th. The transit, bicycle, and ped. Options for getting there are all poor. Please, please work with Mountlake Terrace to create a ped/bike path heading due south from the Mountlake Terrace station, where the elementary school used to be. This path can serve the office building, cinema, extended stay hotel, and other businesses.
Comment Form	{{Drawing suggesting station entrances and location of 130th station}} iPad	I like the plans that I have seen so far but Think that a station at 130th would draw lots of ridership along with a station at 155th. A station at 145th might be good for bus connections but is blocked by the golf course and it would be hard to draw walk on riders. I don't want a huge reliance on park and rides to get to link Light Rail as it would cost Sound Transit more than improving bus connections. As far as the north part, I would suggest not including a station at 220th and keeping the alignment as straight as possible (using the median freeway station at MT) to achieve the least possible travel time between Lynnwood and Northgate Transit Centers. Thanks for the informational open house.
Roll Plot	You are on the right track

Source	Comment
Roll Plot	Is a walkway possible here to avoid walking through 205th/I-5/Interchange? (West side of Mountlake Terrace Transit Center)
Roll Plot	Walkway to businesses near 15th and Ballinger (east side of Mountlake Terrace Transit Center)
Roll Plot	Do NOT put a station here at 145th. Thank you.
Roll Plot	Hill (near east side of 155th/I-5)
Roll Plot	Hill (near west side of 145th/I-5)
Roll Plot	High auto traffic (145th/I-5)
Roll Plot	Noted location of Thornton Creek (east of I-5)
Roll Plot	Sidewalk to Ingraham High School and Helene Madison pool on Roosevelt and 135th
Roll Plot	Stations with entrances at 130th and 127th. Below 130th? Included drawing.
Roll Plot	Potential future station near bridge over I-5, to serve Northwest Hospital and the north end of Northgate neighborhood. Please build straight and level, if possible, to allow future station. (East side of I-5, South of 130th St Station area)
Roll Plot	Need east-west bus route between urban villages
Roll Plot	Do not use NSCC parking lot to replace NG parking!
Roll Plot	Ped/bike bridge (over I-5 near Northgate)
Roll Plot	Off ramp over station? Station over everything? (Drew potential alignment and station location)
Roll Plot	Noted urban village location at Aurora and N 130th St
Verbal	I live at 126th St
Verbal	I live at 8th and 127th
Verbal	What are the dimensions of the stations?
Verbal	What impact will you have on the new public housing?
Verbal	155th doesn't seem connected to anything and 145th is connected but a nightmare!
Verbal	How high is the voltage on the wires?
Verbal	It looks encouraging!
Verbal	East/West connections most critical for bus/making project work
Verbal	130th more logical than 125th
Verbal	Update website with comment form
Verbal	When will you know more?
Verbal	Is Northlink "real"?
Verbal	What is elevated vs. not?
Verbal	How will you deal with overpasses? Interchanges?
Dale Turner YMCA, Shoreline Wednesday, March 14, 4-6:30 p.m.	
Comment Form	I need will lot of my computer online for googlemail.com. I want to say thank you for your time. Have a nice day. I would like you're hope me good time today. {{sic}}
Comment Form	Buses fleet New MCI buses 2012 delivery?
Comment Form	Light rail route from Lynnwood to Seattle/Bellevue/SeaTac from home Lynnwood and work YMCA light rail open 2023 Lynnwood.
Comment Form	Neighborhood needs pedestrian improvements in conjunction with station development (very few sidewalks) also work with City of Shoreline for prioritizing city-funded sidewalks in

Source	Comment
	neighborhoods.
Comment Form	Good to see this finally starting. I support the I-5 option, to consolidate traffic and minimize property impacts.
Comment Form	Our neighborhood is very close to the I-5 corridor. We are concerned about noise, soil erosion, elevated rails in our yards, property values and views.
iPad	Consider adding non rush hour direction trains to Boeing Everett and Mukilteo. Many drivers could get off the road if more trains run
Verbal	I'd love light rail on I-5, I'm so excited. When will this start?
Verbal	Wheelchair access at the stations is very important.
Verbal	Make it easy to get the bikes on board the trains.
Verbal	My home could be affected by the station to the east of N 185th St.
Verbal	The City of Mountlake Terrace likes the alignment next to the transit center.
Verbal	This is very good.
Verbal	When will homes and properties be purchased?
Verbal	When will homes be valued for purchase? My mortgage is for more than my home's worth.
Verbal	What is the eminent domain process?
Verbal	I like the station at N 155th Street but would also be happy with it at N. 145th Street.
Verbal	How large will the footprint of the tracks be?
Verbal	I really think we should be on SR 99 to serve more metropolitan areas.
Verbal	What is Sound Transit? How is it different than Metro?
Verbal	Need to have east-west service improved, especially to Shoreline Community College.
Thursday, March 15, 4-6:30 p.m. Shoreline Library	
Comment Form	My preference is station at N 155th St.
Comment Form	Preferred stations are checked above to give better regional access to local business districts and dense residential areas for Shoreline, Lake City, Lake Forest Park, Edmonds and Mountlake Terrace. I am a local resident and business owner on Aurora.
Comment Form	The 145th St station seems to make more sense rather than the combined 130th and 155th option. However, I do not find the 145th overpass to be pedestrian friendly. This is the reason I have never used the Metro stops at 145th. The sidewalk on the overpass is too narrow and the railing over I-5 is too low - not a comfortable place to walk for anyone with a fear of heights and fear of speeding cars. I think the overpass should be made wider to better accommodate pedestrians and bikes. The railings could be made much higher. If these amenities were made, considering the number of bus routes on 145th, the station would be well used.
Comment Form	While I support light rail, I oppose the construction of a station at 185th St. There isn't enough area to support the increase in traffic and the impact on the residents there would be very detrimental.
Comment Form	Please ensure against situation similar to Seattle Monorail Project in Ballard. If lots acquired by eminent domain and the project is abandoned, displaced property owners should be given right of first refusal to re-purchase their lots at or below the amount they were paid.
Comment Form	Concerned about multi-modal access to stations from the east side of the I-5 alignment for Lake Forest Park residents. Topography in this area has prevented efficient bus service, so park and ride facilities adjacent to stations is very important.

Source	Comment
Comment Form	Put stations at P&R lots (existing ones) easy transfers to other modes. Put at 145 - P&R lot can transition in the long term to TOD. Bus access to stations from E & W are key. Right now no service. On South LRT line, no one can get there unless drive. Put at grade as much as possible. ID areas of potential high levels of noise and plan early to mitigate in neighborhoods.
Comment Form	Having stations at 155th and 130th/125th would seem to indicate a slower speed. Also, 145th seems to be a nexus for transfer stops. How much more will cost increase for 2 stations vs. one? I'm okay with 185th eastside with improvements for accessibility and walking.
Comment Form	It would be a lot of help.
Comment Form	This would be great to expand it and convenient.
Comment Form	Your route shows this project as going through my house that I have owned and improved on since 1974. And the way the county keeps depreciating land values, this scares me! I am totally against this project. Either down the middle of I-5 or through the park, dump, bus station.
Comment Form	North Corridor stations in general. One of the problems I see is that all the stations are located in areas that just don't promote commerce. By this, I mean when you get off at these stations you have to drive to stores and shops. These stations should be designed in a way to include shops, stores, living spaces. Can't we integrate stations into some sort of complex? A station by itself is a waste of space and land.
Comment Form	Is my home at 363 NE 178th St, corner of 5th Avenue NE, clear enough or impacted by the right-of-way??
Comment Form	Need more info, 11300 1st Ave NE #222, Seattle WA 98125
Comment Form	Need more information. 11300 1st NE #202, 98125 206-367-7016
Comment Form	I want to know how long before they take it down like they did with the Interurban. 206-364-5557.
Comment Form	Want to know what area from 5th Ave NE to freeway the station will be. How much property would you take?
Comment Form	I will like to know that all our concern about the land being give a serious thought and the consequences of progress not cost our homes. {{sic}}
Comment Form	The biggest concern is parking
Comment Form	Please work with Shoreline, WSDOT and Sound Transit on the proposed improvements to 145. This arterial has potential for a transit corridor. Don't be deterred by current conditions.
Comment Form	I think the two stations should be 145th and 185th on west side.
Roll Plot	Future special service until so anytime by 2030 new Everett Station
Roll Plot	We thinkful would maybe to the future united or it willing can't see to future about Everett link light rail station center. {{sic}}
Roll Plot	I would unlike reknew it to try I might be however so long away into trip on link light rail. I will be available are learning how to planner I'll maybe be new wife - a new life was what I think about. New Lynnwood link lightrail I'd looking this likely us those on the street P&R city of Lynnwood on 44th Ave W until 2021-23. {{sic}}
Roll Plot	I like the 220th Street Station - closer to my home.
Roll Plot	Live in Shoreline, work at Premera - 220th in MLT. Would like a station there. Biggest employer in MLT.
Roll Plot	Yes for MLT P&R stop - couple as many modes as possible at 1 stop
Roll Plot	ID any areas of rail ahead of time where there may be noise - plan early for noise-reduction

Source	Comment
	for neighborhoods.
Roll Plot	No on west side of N. 185th. No - stadium too close, traffic congestion.
Roll Plot	Stadium/center complex foundation for parking. West side 185th
Roll Plot	185th West Site could provide less busy area for expand a commute grow. Good choice 185th.
Roll Plot	185th Yes - traffic/circulation concerns - enough capacity for buses (every 40 blocks Ngate 145th and 185th).
Roll Plot	I think that the 185th would be great yet how would it effect parking or current traffic.
Roll Plot	I like 155th and 185th
Roll Plot	Like 155th with additional parking.
Roll Plot	Not through my HOUSE. 170th and 1st NE
Roll Plot	No! 155th Yes 145 on eastside!
Roll Plot	145th Yes - needs P+R lot can yes as a potential TOD in future
Roll Plot	Parking - 145th with ample parking is better than 155th with parking but none at 130th, with bus service currently, people will drive to stations.
Roll Plot	Dual stations! 155th and 125th or 130th
Roll Plot	I prefer station at 145th more function position and on very active street (145) and location very accessible.
Roll Plot	510 and 511 stop here, 145th a good option!
Roll Plot	Prefer more stops vs. less.
Roll Plot	Shoreline Center/current parking lot by football stadium is opportunity site for shared parking structure. Rail parking by day during the week. School district activity nights and weekends.
Roll Plot	A transit station at 185th (west) would provide better access to the center of Shoreline and access to the business district on Aurora and Shoreline Center
Roll Plot	Crossing over to west side is an unnecessary cost. Put station on east side. (N. 185th St.)
Roll Plot	No land available for parking. People who can't drive to station won't ride the train. (N. 155th St.)
Roll Plot	No easement/right-of-way for station. Wet lands. Park. (N. 155th St.)
Roll Plot	Park and ride at 145th is filled over capacity! Plenty of rider potential for rail. Parking overflows out on to 5th. Bus riders even park as far north as 165th and 5th in the business area and catch the bus to go south. Business area/bus rider parking got so bad that 2 years ago Shoreline posted 2 hour parking limits
Roll Plot	Please work with Shoreline, WSDOT and Metro on the improvements planned for 145th. This arterial should have potential as a transit corridor.
Verbal	I need to find the timeline online for the project.
Verbal	I want a community information meeting with Ridgecrest (400 emails/blog)
Verbal	Would like easy access for LFP residents
Verbal	What will keep this from taking homes?
Verbal	When will you know more?
Top Food Market Street Café, Shoreline Friday, March 16, 11 a.m.-2 p.m.	
Comment Form	Prefer these two stops in the Shoreline area. Parking is needed at the stations – very important!
Comment Form	One can not talk to Metro planners only by complaint filing—Northgate via NW Hospital via

Source	Comment
	Aurora and Washelli to I-5 at 145th then north to station at N. 175th. The major arterial from Shoreline City Center and North City.
Comment Form	I'm thrilled at the prospect of a station on east side of freeway at N 185th—that would be within walking distance of my house and therefore would get frequent use by me.
Comment Form	Parking in the neighborhoods by commuters. Will a parking garage be built or will we have to fight for parking in front of our own homes?
Comment Form	Concerns around street parking impact and street congestion. Also concerned about additional noise, as we live close to the proposed station location.
Comment Form	Lid from NE 155th to 185th sound suppression/decibel reduction over non-suppressible 20 block I-5 stretch--NE 155th to NE 185th a natural drainage to Twin Ponds and Pevealy {{sic}} Pond to Jackson via east side of I-5.
Comment Form	Please provide ample parking for older and disabled people who live too far for walking (and cross town busses are too infrequent!)
Comment Form	I commuted for work to the University District for over 25 years and to downtown for about a year. During those times I tried to use the bus and leave my car at home. I found that bus schedules tripled my commute time (to the U-District) and did not offer good options to make the downtown commute a consistent one. I ended up driving to work in the U-District and then later driving to Northgate to catch a bus when I worked downtown. My opinion is that if the light rail solution depends on bringing riders to the stations on buses, it will be extremely important to coordinate options and schedules so that people are able to get to the job and get back home in a manner that benefits their entire day. It can't make them be late for work if there is just one bus and it cannot significantly increase their travel time compared to driving. I love the idea of using light rail as an option. I've visited other large cities and used transportation systems to travel the cities. When they work well, it's so much easier than using a car.
Comment Form	As an owner of an electric vehicle I would like to see both L2 and L3 charging available at these stations. L3 or DC fast charging in particular is critical for fast on demand charging, taking only 30 minutes. It would seem logical that with the high energy power lines being put in for the train that fast charges could perhaps feed off of it.
Comment Form	If funds allow the 145th, 155th, E. 185th would be cost/benefit. More riders. About time folks!
Comment Form	My home has been in my family 50+ years. We have endured the freeway being built, the bus barn built at 165th, and 15th Ave NE street being condensed to 2 lanes—all of which has impacted the quality of our life. No sound barrier wall built along I-5 as once promised, increased traffic on 5th Ave NE. The noise level from the freeway itself is almost unbearable (add the airline traffic above in this area also). What has been given back to this Shoreline Community? I only see our quality of life (and now our homes) taken away from us. I am truly disgusted with WSDOT and Sound Transit. What can you say or to do change my mind?
Comment Form	I think this is a great idea and project. I support it! Please consider my vote for a 130th Station and a 155th Station. I think 145th would be ok if traffic can be mitigated somehow. Also, please consider pedestrian west to east of I-5 access to the light rail station.
Comment Form	Traffic on 5th Ave. between 175th and 185th ever since that 4 way stop was put in on 10th, traffic on 5th has increased, because cars do not need to stop at 180th. The speed of these cars has also increased. People use 5th as a thru-way to or from the freeway. This is a concern right now. If there is a station put in, traffic would most likely increase. Would a stop be put in at 5th and 180th to help control the speed of these drivers and traffic? It is especially a concern because there are school bus stops on 5th in this area. I have witnessed cars speed North down 5th then take a right so wide that they end up in the oncoming lane, or so

Source	Comment
	tight, they end up on the shoulder. A danger to both cards and pedestrians as there is no sidewalk. They also rarely stop for pedestrians in or at the crosswalk at 5th and 180th. I really hope this is looked at. Thank you.
Comment Form	Suggest to plant more trees along I-5 (within the coverage of the project) or add other structures that will minimize the noise that already is a problem for us who live closest to the freeway. Otherwise I believe the project, overall, is good for the community.
Comment Form	With traffic through Shoreline, that is far heavier, this is a necessary project; the development around the identified stations (Shoreline) will add to the economic growth of the community; hopefully all considerations could be given to Shoreline's elderly and disabled population.
Comment Form	I am very excited about light rail in my community however the possibility of a station at 155th would be unacceptable. I live off of 155th and 8th NE and use 155th daily. This street is a quiet, slow, residential thoroughfare that serves 2 major Shoreline parks and an elementary school. Increased traffic on 155th would potentially lead to car/pedestrian accidents for those reasons. 145th and 185th are the obvious options for stops within shoreline. The fact that Metro would "prefer" (and now uses) 155th is only due to 145th being in such poor shore and congested during peak hours. 145th, being a "state highway" and part of an alternative route over Lake Washington, should make it a major hub of transportation. It needs improvements to accommodate, Metro bus service and a large light rail station. Thanks.
Comment Form	If you can get people to the stations efficiently by mass transit or provide parking—great. Otherwise it is better to drive my car to the Northgate Transit Center and take the 41 or 303 to Seattle. The east-west traffic flow is best for N 130th St Station. It would be great to have good east-west mass transit to the freeway station. The time it takes to ride mass transit needs to be near what it takes to drive my car.
Roll Plot	NE 156th to NE 160th and Ridgecrest Park
Roll Plot	Natural water course near Twin Ponds - natural drainage
Roll Plot	145th and 155th is a excellent choice. 130th s/b included if funds are available
Roll Plot	Prefer 155th!
Roll Plot	Put station at 145th OR 155th/130th
Roll Plot	Future station at 220th
Verbal	155th not a good spot
Verbal	When is Ulink open?
Verbal	Is it I-5 for sure?
Verbal	My house is right there - 185th
Verbal	Traffic on 5th ave increasing or speeding
Verbal	Should go to the mall
Verbal	185th concern - has been narrowed and more congested on West Side
Verbal	More trees or noise mitigation
Verbal	Will the stations be elevated?
Verbal	Ridgecrest - want to know major issues
Verbal	Where will people park?
Verbal	I'm worried people will park on street near my house!
Verbal	Stated mechanism needed researching acquisition/in case of failure to complete project.
Verbal	Need better connections to Shoreline Community College

Source	Comment
Verbal	Very nice forum - very convenient
Verbal	The less stations, the better
Verbal	Fix map so 175th is center of community
Verbal	155th – lid from 155th to 185th
Verbal	1500 parking spots for whole corridor!
Verbal	185th would be good!
Top Food Market Street Café, Edmonds Saturday, March 17, 11 a.m.-2 p.m.	
Comment Form	I prefer stations at the locations checked (I-5 route, N. 145th St., N. 185th St., Mountlake Terrace Station Area, Lynnwood Transit Center Station Area)
Comment Form	145th is logical place for a station and park and ride
Comment Form	North Corridor – good to have security person at stations where needed. I was impressed that there was a security person at one of the stations along Martin Luther Kid Way. I was also impressed that a security officer checked passengers for tickets. Three people were escorted off of train. If possible, I would like to have enclosed waiting areas with visibility all-around. This would help in our cool, wet climate and encourage more passengers. Please use1% for arts fund and donations to make stations as beautiful as possible. Current seats on light rail are too narrow and too hard. Great windows (large) on the trains now. Very enjoyable ride! When my husband and I traveled on the light rail for the first time 2 weeks ago, we only saw one couple who was obviously going to the airport (they have wheeled suitcases). I thought more people would use the train to go to the airport. One problem at the airport, is that people have to walk a long way to the terminal. It would help to add clear walls (glass) to protect people against the cold and wind. It is a long way to get to walk to the airport for disabled people. It would be helpful to add seats along the walk for resting. (We traveled from the University Station to the airport and walked around to the airport and then returned to the West Lake Mall stop. Then returned by bus to the Kenmore park and ride. University District Stop: I would support having a security officer there fulltime because of the crime problems in the U. District and because the stop will be underground. I support the current 20-hour service with a 4-hour closure for clean up because that will discourage transients from camping at the stations. North Corridor: I supposed the proposed 4 stops so that travel is as quick as possible to downtown Seattle and the airport. Please work with Community Transit to provide direct bus service between the light rail stop and the Edmonds ferry.
Verbal	Completion date?
Verbal	Will there be any impacts to wildlife/wetlands
Verbal	Will there be security in the U-Link tunnel station?
Verbal	When will we have more info on the alts?
Verbal	Support 4 stations so it's faster
Verbal	East-west connections
Verbal	Indifferent to whether stations are on east/west--not potentially impacted
Verbal	Owner, just want quickest route to downtown
Verbal	Would like to see a good connection to Edmonds ferry
Verbal	I-5 a no-brainer
Verbal	Build fast!

Source	Comment
Verbal	Prefer 145th
Verbal	Put Lynnwood Station as close as possible to the transit center
Verbal	155th—no! 145th better for future development and connecting buses.
Lynnwood Recreation Center, Lynnwood Monday, March 19, 4-6:30 p.m.	
Comment Form	Hooray LR to Lynnwood!
Comment Form	I would prefer the route to the transit area closest to the I-5. This mitigates wetland issues and allows a continuation to Lynnwood City Center (future station) park III without condemnation or removal of existing businesses. Thank you. Planning Commissioner.
Comment Form	This is exciting. I have a small home of 35th and 208th Pl SW. Looking forward to walking to transit center and taking fast transit to Seattle.
Comment Form	#1 125th is redundant, us #3 the 145th station. Forget the #2 130th station also and #4 the 155th station seem excessive. Definitely need the 185th, #6 MLT and possibly the 220th station. My preference is for the 185th station to be on the east side of I-5.
Verbal	Much interest in seeing this go to Ash Way
Verbal	VOA property at 164th--much potential for senior riders
Verbal	Smoky Point – up to
Verbal	Shortest points between transfer and actual station—short walks!
Verbal	Closer to existing park and ride and commercial the better
Verbal	SNOTRAC: Sunrise Services—private corporation – Senior Housing
Verbal	SNOTRAC: Stillaguamish Tribe – Snohomish County Human Services
Verbal	What's the start of service date?
Verbal	Would existing 511 be discontinued?
Verbal	Heard from Twitter, thought I'd stop by!
Mountlake Terrace Library Tuesday, March 20, 11 a.m.-2 p.m.	
Comment Form	Keep the rail to the east to the MLT park and ride lot.
Verbal	How much additional parking?
Verbal	Timeline for the project?
Verbal	East or west of the freeway
Verbal	Property acquisition
Verbal	This is very exciting
Verbal	Great way to increase value
Verbal	Are these all set in stone?
Verbal	Need to increase east-west service
Verbal	How fast/how often?
Verbal	Will this impact the HOV lanes?
Verbal	This process is moving too slow!
Verbal	Are you considering transit time in your evaluation?

Source	Comment
Lynnwood Library Wednesday, March 21, 4-6:30 p.m.	
Comment Form	I like it. It is exactly what I wanted and advocated.
Comment Form	I like to ride train right now. That is very helpful. Good start. Thank you.
Comment Form	Please make sure there is parking near the transit stations! Thank you!
Comment Form	Just a general comment that I'm very excited that these are plans to extend the Link to the north. Thanks.
Comment Form	This is a much-needed project, though it won't be finished for at least 11 years. In the interim, it would be helpful to reinstate a bus routes between Lynnwood Transit Center (or Ash Way) and Northgate. I used to take the bus but now I drive…
Comment Form	Send graphics!
Verbal	This is great but it won't be adequate. Need to be more like NY City.
Verbal	Very excited about this project. When will it be open?
Verbal	Will the Lynnwood station be located in the swamp?
Verbal	This project isn't worth it. Cap it at Northgate and give Seattle what it wants.
Verbal	More east-west options during off peak times
Verbal	How much?
Verbal	How will TOD be affected by the alignment near I-5?
Verbal	I love this project! It can't come soon enough
Mountlake Terrace Recreation Pavilion Thursday, March 22, 4-6:30 p.m.	
Comment Form	Hurry! Want this now! ☺ Parking availability is biggest concern
Comment Form	N/NE 185th and N/NE 155th St are important east-west corridors for bicyclists and drivers who live/work on the "north end." Travel times east-west on those 2 streets are 1/3 to ½ the time it takes on N. 205th, N/NE 175th and N/NE 145th streets. (This has little to do with access to LINK light rail. If stations are built at NE 155th or NE 185th please preserve as much as possible the current east-west corridor travel times. I would like to be contacted about this issue as are likely to get little feedback on this issue. The fewer stations the better, for feaster train times. Therefore I prefer "Option 2" with a station at NE 145th St and NOT at 155th, 130th or 125th Streets.
Comment Form	I think it's great expanding light rail out to Mountlake Terrace. I feel it will ease traffic and provide additional alternatives to driving.
Comment Form	Hoping to see current freeway median bus stop converted to light rail and station more enclosed than current design. Extremely cold, loud and fumes from roadway.
Comment Form	Please do this as soon as possible! I will pay whatever I need to. We'll use light rail all the time.
Comment Form	The flyer stop seems like a more natural choice for the light rail station than the transit center.
Comment Form	Very excited about light rail in Mountlake Terrace at 220th
Verbal	We're really excited about this!
Verbal	When will it be ready?
Verbal	When will decisions about alignments be made? And Stations?
Verbal	Will it be elevated?

Source	Comment
Verbal	Are these all being considered?
Verbal	I like having two stations (155th and 130 or 125) instead of just one (145)
Verbal	We're so behind on the times
Verbal	Sounds like a great idea!
Verbal	Make sure you have parking!
Verbal	Edmonds School District would like a briefing
Verbal	Good idea!
Safeway Pinehurst Saturday, March 24, 11 a.m.-2 p.m.	
Comment Form	We are a walking community. There is no room for more traffic in our area between 145th and 175th and 5th ave. Ridgecrest Park is heavily used as well as Paramount Park. Crest Theater and the Shoreline Library are all used by our community. This is not an industrial area. We love our homes and our community. We don't want to move.
Comment Form	2 support the 125th/130th and 155th option. My experience is that stops do not add materially to the schedule and having the two stations would provide better access.
Comment Form	Not within the scope of this project. However: A "moving sidewalk" should be added to the Sea-Tac Station. This is too far for elderly, disabled to have a suitcase!
Comment Form	How far east will this project go and what will lightrail do to help with parking in an already very crowded parking area
Comment Form	I-5 at 175th Route should be on east side because of Ronald Bog. Strongly prefer 2 stations at 125/130 and 155.
Comment Form	Yeah! Hurry it up! ☺ We'll use it.
Comment Form	There should be buses running every 5 minutes running east-west along 130th St, 145th St, Northgate Way, etc. Then anyone living in North Seattle is close enough to a light rail station and won't have to drive to a park and ride.
Comment Form	I would really like there to be free parking next to the light rail station so that people that live farther away can and will take the light rail rather than driving. Please also keep the light rail as affordable as possible.
Comment Form	There should be a station at 130th St and 155th St. There are a lot of people that live by 130th who would benefit from being close to a station.
Comment Form	Please provide free parking at Northgate Station for all the local neighborhoods.
Comment Form	I live in the 125th St area. I can see that 145th is a bigger priority, but without a station at 125th/130th that area it is going to be awkwardly served. Especially since I assume bus #41 could be cut. A new bus route along 125th/130th could also serve Lake City efficiently, especially if the new bike lanes are removed.
Comment Form	I read there was a independent study done and it show this was not cost effective it would be better to use buses on I-5. How far from the freeway will you be buying homes?
Comment Form	Voting for 130th Station. Would be great for Pinehurst, Waller Lake, and surrounding neighborhood.
Comment Form	I don't want to have to walk to I-5 to catch my bus (Route 77 and 73, which stop closer to my house). It would be too inconvenient for me.
Verbal	When is it expected to start?
Verbal	Will my property be in the right of way?
Verbal	Will this replace buses?
Verbal	What side of freeway will this be on?

Source	Comment
Verbal	There should be a moving sidewalk to the light rail at the airport.
Verbal	Escalator at Pioneer Square station is too narrow.
Verbal	Will a station at 130th be on 5th? Will it be in the right of way?
Verbal	Will it be elevated or at grade?
Verbal	I'm excited about this project. Glad it's on I-5.
Verbal	Will parking be elevated in structures or in lots?
Project Email	
Email	We are unable to attend the meetings this week as we are in Oklahoma, but we own a house at I-5 and 185th. Can you share with us the plans for this area? Thanks for the card in the mail about the open houses coming up.
Email	About the light rail extension to Mountlake Terrace, my comment is that I would like to see a station at N. 185th St. I also see that shuttle buses running east/west across each of the stations, would make this train more useful to most people. Parking needs to be available, but that won't serve everyone. As far as how I'll use it, I'm an East Shoreline resident. By the time this line is finished I hope to retire from work, however it would be wonderful to be able to take the train to the University and to downtown. Thank you.
Email	The three most important stops (not the only stops) for me would be: * Mountlake Terrace * Lynnwood Transit Center * Alderwood Mall (end of line)
Email	Thank you for taking time this weekend to talk to me about the potential light rail station options in N Seattle for the North Corridor Transit Project. If it jogs your memory, I'm the tall English guy with long curly hair and a beard :) With projects like these, there's never a perfect place for any option, and yet, for our city to thrive and grow in the future, this is a neccesary project and so somewhere has to be chosen. My preferred option is definately the original proposal at 145th, and not just because I live very close to the option at 130th. I believe it could be made to be a viable option as long as my concerns about parking can be addressed, and would be incredibly convenient for me, I just think that 145th will be cheaper, and more convenient for more people than 2 stations N and S of it. Below, I've listed what I hope come across as balanced thoughts both positive and negative for each option we discussed. Please let me know if any of this is unclear or raises further questions from you. I look forward to the results from the EIA's and the subsequent direction this sends the project group. Best Regards Gavin Jewell

Source	Comment
	529 NE 130th Street. Feedback on proposed Light Rail extension; stations at 125th, 130th, or 145th: 125th Good E transit links with routes 41 and 252. No parking Poor E/W access - would not serve Haller Lake at all without additional freeway bridge. Would not serve Shoreline. 130th Poor transit links E/W (buses) Poor transit links N/S (buses) Good Parking options at Park n Ride to North (Jackson Park Golf Course) Large Church Parking Lot to North Highly residential area Close-by very quiet neighborhood (NE 130th and surrounding) currently has zero on-street parking - risk of significant (i.e. any) disruption high without controls even with parking at park n ride and church Close-by neighborhood very low crime, peaceful, of architectural significance If station built in freeway cutting, unobtrusive visually and audibly to neighborhood Large grassy area on E side of freeway between on-ramp and freeway may offer good alternative space and better serve Haller Lake residents Additional traffic through already busy, accident prone and pedestrian unfriendly 130th/5th intersection likely to increase Potential for Trail visitors to traverse local neighborhood for unofficial trail entry despite official access on 5th Ave & 145th 145th Good local transit links N/S and E/W - plenty of buses. Jackson Park Perimeter Trail official entrance located here in anticipation of future light rail station Close-by existing park and ride areas to north AND south Large available square footage area within existing transit/freeway boundaries Situated on existing large busy arterial for good access without adding much impact to quiet neighborhoods. Near School area (Lakeside Upper School) Would serve both Pinehurst and Shoreline, Haller Lake and Lake City 155th I don't know this area well - but is highly residential Shoreline, with potential for large impact from station traffic. Close to Parkwood and Evergreen schools Some parking at close-by Twin Ponds Park and possibly local church Appears to be plenty of space, at least on E side of freeway with no competition from on-ramps Would serve Shoreline well, but not Pinehurst

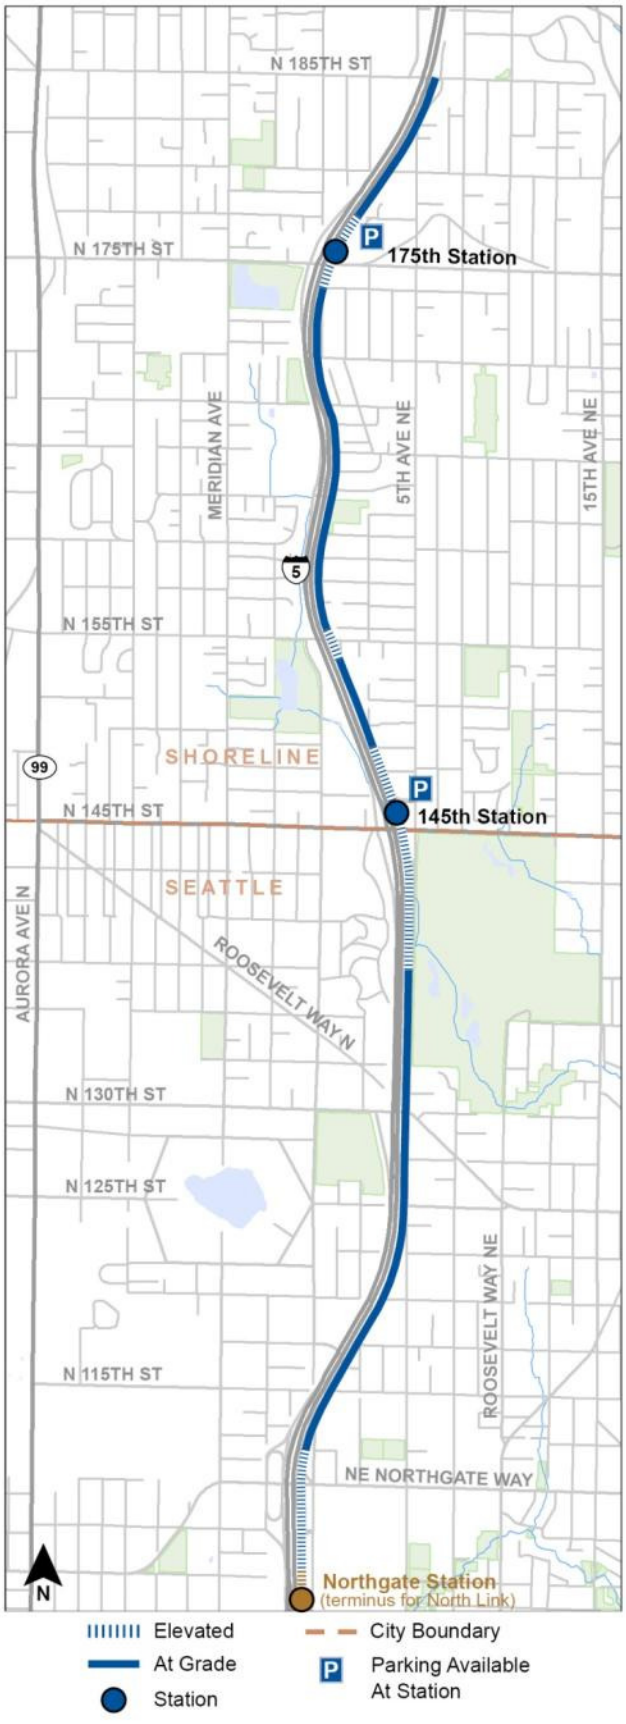
Alternative A1: At-grade/elevated to 145th and 185th east side stations 11
Alternative A2: At-grade/elevated to 145th east side and 185th west side stations 12
Alternative A3: Mostly elevated to 145th and 185th east side stations 14
Alternative A4: Mostly elevated to 145th east side and 185th west side stations 15
Alternative A5: At-grade/elevated to 130th, 155th and 185th east side stations 17
Alternative A6: At-grade/elevated to 130th and 155th east side and 185th west side stations 19
Alternative A7: Mostly elevated to 130th, 155th and 185th east side stations 21
Alternative A8: Mostly elevated to 130th and 155th east side and 185th west side stations 23
Alternative A9: At-grade/elevated to 145th and 175th east side stations ..... Appx C
Alternative A10: At-grade/elevated to 130th, 145th and 185th east side stations ..... Appx C
Alternative A11: Mostly elevated to 130th, 145th and 185th east side stations ..... Appx C
Segment B
Alternative B1: East side to Mountlake Terrace Transit Center to median 25
Alternative B2: East side to Mountlake Terrace Transit Center to west side 27
Alternative B2a: East side to Mountlake Terrace Transit Center to west side with 220th Station 29
Alternative B3: East side to Mountlake Terrace Transit Center to east side 31
Alternative B4: East side to Mountlake Terrace Freeway Station to median 33
Alternative B5: West side to Mountlake Terrace Freeway Station to median 35
Alternative B6: West side to Mountlake Terrace Transit Center to median 37
Alternative B7: West side to Mountlake Terrace Transit Center to west side 39
Alternative B7a: West side to Mountlake Terrace Transit Center to west side with 220th Station 41
Alternative B8: West side to Mountlake Terrace Transit Center to east side 43
Segment C
Alternative C1: 52nd Ave W to 200th Street station 45
Alternative C2: 52nd Ave W to Lynnwood Transit Center station 47
Alternative C3: I-5 to Lynnwood Park & Ride station 49
Appendix A: Environmental Scoping Summary Report
Appendix B: March 2012 Drop-In Session Summary
Appendix C: Alternatives A9, A10 and A11 Added by the Sound Transit Capital Committee

APPENDIX C

ALTERNATIVES A9, A10 and A11 ADDED BY THE SOUND TRANSIT CAPITAL COMMITTEE

APPENDIX C

A9: AT-GRADE/ELEVATED TO 145TH AND 175TH EAST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 117th Street, then in retained cut/fill to north of 130th Street, then elevated to north of 145th Street, then retained cut/fill to 175th Street except for elevated crossings of 155th and 175th Street. North of 175th Street the guideway runs in retained cut/fill to 185th Street.

Stations: An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 145th Street. An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 175th Street.

Relative pros and cons of this alternative:

- Provides regional service coverage in North Seattle and Shoreline
- 145th Street and 175th Street stations serve both local and freeway access and provides opportunities to feed existing commuter buses to rail, but all day bus service is limited
- NE 175th Street congestion hinders access to the station
- Walk access more difficult from west of I-5 due to freeway ramp crossings, hills and freeway undercrossing
- Higher potential for traffic impacts due to existing congestion
- Guideway profile optimized to reduce cost and provide additional flexibility to avoid some environmental impacts

Evaluation results: (see next page)

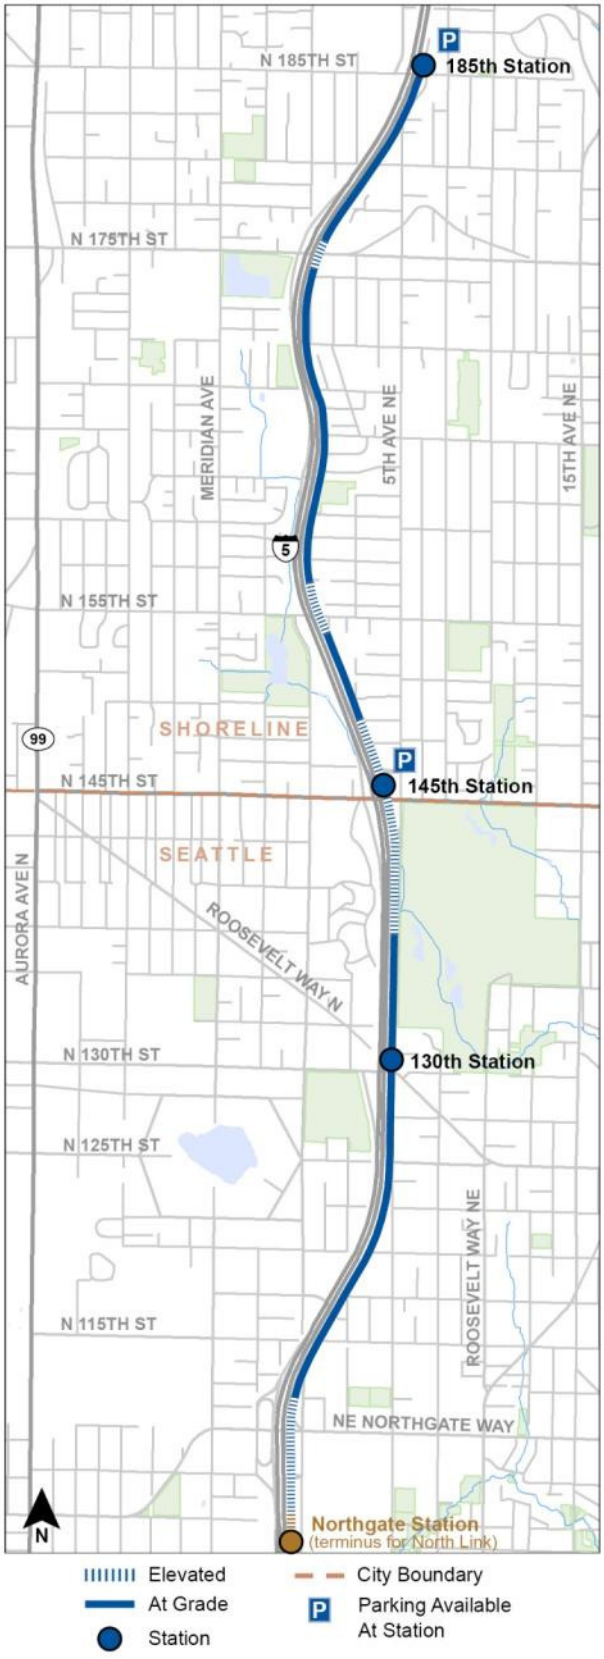
APPENDIX C

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Improved regional auto access with proximity to I-5 interchange, although park and ride market is predominantly local. Auto and bus access affected by traffic congestion and backups at interchange ramps. Less desirable pedestrian and bicycle environment to and from the west due to presence of high volume ramps and intersections, hilly terrain, and crossing under I-5. Reduced existing bus access at 175th with peak period-only service, compared with all-day service at 185th.
Ridership Potential	Similar
Potential Environmental Effects	Similar, except for higher potential for traffic congestion impacts due to a park and ride and station on NE 175th Street, which is currently congested. The 175th Station increases property and visual impacts to nearby residential areas, while neighborhood impacts in the NE 185th street area would be reduced.
Development Potential	Similar overall, but constrained on west side of I-5 by Ronald Bog.
Cost Implications (2010$ M)	$10M to $15M more, which includes savings of less complicated construction around NE 185th Street.
Constructability	Similar overall; increase in impacts at 175th is offset by reductions at 185th.
ROW Implications	Similar overall. A station at NE 175th would reduce property needs at NE 185th Street, but increase them at NE 175th Street.

APPENDIX C

A10: AT-GRADE/ELEVATED TO 130TH, 145TH AND 185TH EAST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, generally on elevated structure from Northgate Station to north of 117th Street, then in retained cut/fill to north of 130th Street, then elevated to north of 145th Street, then retained cut/fill to 175th Street except for elevated crossings of 155th and 175th Street. North of 175th Street the guideway runs in retained cut/fill to 185th Street.

Stations: A retained cut/fill station with on-street bus facilities would be located at NE 130th Street. An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 145th Street. An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

Relative pros and cons of this alternative:

- Three stations provide more service coverage and ridership potential in this segment than the two stations included in Alternatives A1 through A4.
- Added station adds cost
- 130th Street station has more apparent opportunity for transit oriented development
- 145th Street station serves both local and freeway access and provides opportunities to feed existing commuter buses to rail, but all day bus service is limited
- Potential for closely-spaced 130th and 145th Street stations to compete for riders
- 185th Street station serves local access needs and supports potential redevelopment near the station
- Guideway profile optimized to reduce cost and provide additional flexibility to avoid some environmental impacts such as ecosystems

Evaluation results: (see next page)

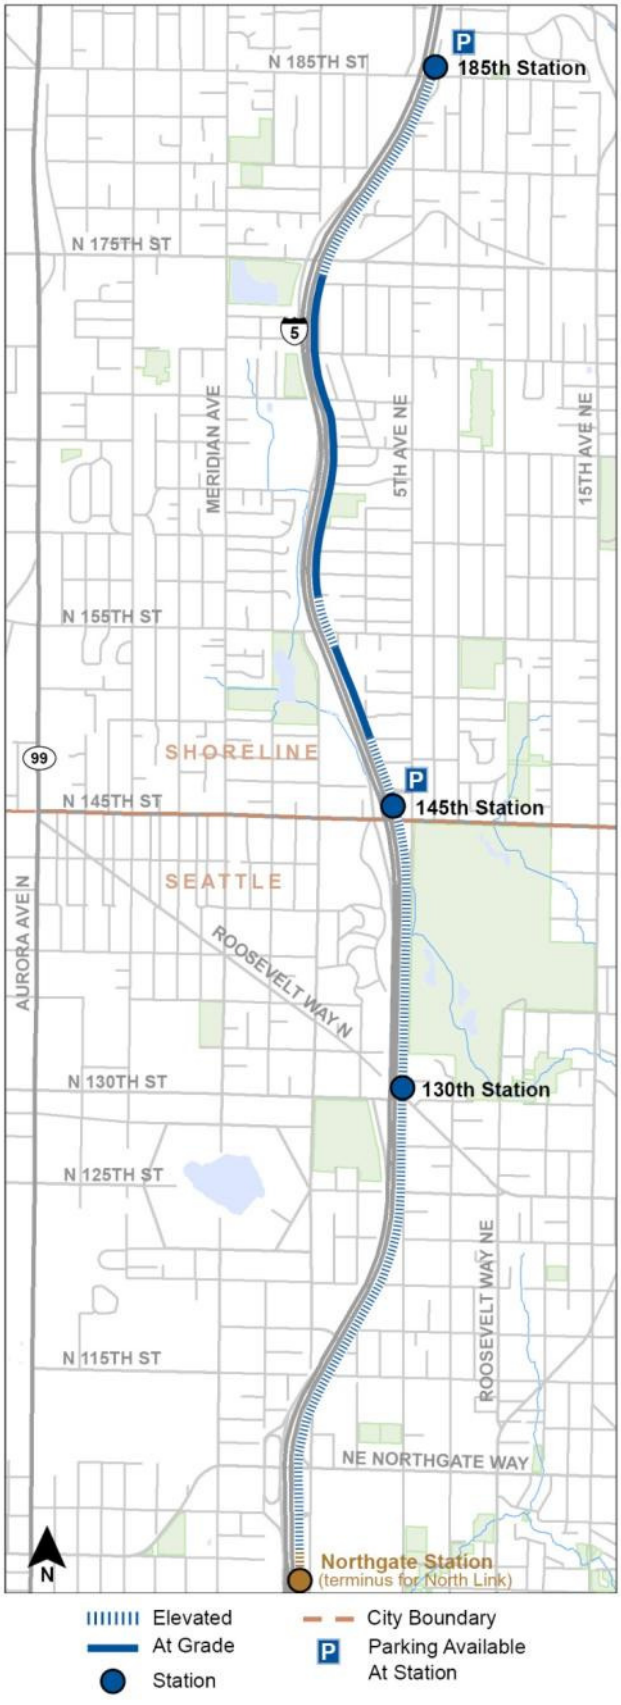
APPENDIX C

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Travel times would be slower due to added station
Ridership Potential	Moderate increase as result of increased population within walking distance of three stations instead of two
Potential Environmental Effects	Similar
Development Potential	Slightly better. 130th Street Station is within 0.5 miles of existing commercial node. Otherwise, predominantly single-family development surrounds stations.
Cost Implications (2010$ M)	$40M to $45M more
Constructability	Slightly more difficult, due to wider section at 130th Street Station and fewer staging areas available at 130th.
ROW Implications	Similar.

APPENDIX C

A11: MOSTLY ELEVATED TO 130TH, 145TH AND 185TH EAST SIDE STATIONS



Guideway: The guideway runs along the east side of I-5, in WSDOT rights-of-way wherever possible, on elevated structure from Northgate Station to north of 145th Street, then retained cut/fill to 175th Street except for elevated crossings of 155th and 175th Street. North of 175th Street the guideway runs primarily on elevated structure to 185th Street.

Stations: An elevated station with on-street bus facilities would be located at NE 130th Street. An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 145th Street. An elevated station with up to 500 park and ride stalls and on-street bus facilities would be located at NE 185th Street.

Relative pros and cons of this alternative:

- Service coverage, station access, ridership and transit-oriented development opportunities similar to A10
- Added station adds cost
- Potential for closely-spaced 130th and 145th Street stations to compete for riders
- More elevated guideway could reduce potential impacts to I-5 bridges and ramps, some properties and some environmental resources, but increases costs

Evaluation results: (see next page)

APPENDIX C

Evaluation results:

Criteria	Performance Compared to the AA I-5 Alternative
Transportation Performance	Travel times would be slower due to added station
Ridership Potential	Moderate increase as result of increased population within walking distance of three stations instead of two
Potential Environmental Effects	Similar to slightly less.
Development Potential	Slightly better. 130th Street Station is within 0.5 miles of existing commercial node. Otherwise, predominantly single-family development surrounds stations.
Cost Implications (2010$ M)	$120M to $135M more
Constructability	Potentially less difficult because northbound off-ramp would not be rebuilt at 130th Ave. However, there are fewer staging areas available at 130th.
ROW Implications	Similar to slightly less.

Appendix L

Public Involvement and Agency Coordination

APPENDIX L – PUBLIC INVOLVEMENT AND AGENCY COORDINATION

In addition to the Draft EIS scoping meetings and related outreach described in Chapter 6, Sound Transit met with many other parties as part of the Draft EIS development. The meetings included agency and stakeholder briefings, including with groups involving or servicing low income and minority populations. Sound Transit also developed public displays and produced newsletters at several points leading up to the Draft EIS release. Since the publication of the Draft EIS, Sound Transit has continued to communicate project information to the public, including selection of the Preferred Alternative and revisions to design.

Event Date	Event/ Event Location	Environmental Justice Event	Notes	Environmental Justice specific notes
6/11/2014	Spring 2014 Newsletter	✓	Mailer sent to 83,500 people, using the same distribution area as the Draft EIS notification. Topics included a general project overview, preferred alternative map and description, upcoming work and opportunities for the public to meet with staff at community drop-in sessions and/or fairs and festivals.	Translated information about how to contact the project for more information.
6/6/2014	GovDelivery of Spring 2014 Newsletter		Email update sent to subscription list to share information included in the Spring 2014 newsletter.	
6/3/2014	Link Operations & Maintenance Satellite Facility DEIS Public Meeting		Information table about the Lynnwood Link Extension Project at the open house.	
6/2/2014	Geotech flyering		Flyered residences nearby the following geotech fieldwork locations: A12, A15	
5/26/2014	Survey work right of entry calls		Called property owners to notify them of upcoming survey work: 1005, 1003, 1020, 1027, 1007, 1015, 1019, 1001, 1109, 1032	
5/19/2014	Survey work right of entry calls, Geotech flyering		Called property owners to notify them of upcoming survey work: 644, 646, 649, 653, 651, 642, 633, 628, 989, 993, 996, 998 Flyered residences nearby the following geotech fieldwork locations: A38, A29/30, A31, A35, A36, A54, A11	
5/12/2014	Survey work right of entry calls, Noise monitoring calls, Geotech flyering		Called property owners to notify them of upcoming survey work: 640, 636 Called property owners to notify them of noise monitoring installation: M54, 1095, 427, 420 Flyered residences nearby the following geotech fieldwork locations: A41, A40, A39	
5/10/2014	Cinco de Mayo with Familias Unidas	✓		
5/5/2014	Survey work right of entry calls, Geotech flyering		Called property owners to notify them of upcoming survey work: 618, 628, 630, 626, 616, 621, 614 Flyered residences nearby the following geotech fieldwork locations: A46, B05, A51, A50, A48, A47	

Appendix L Table L-1. Lynnwood Link Extension Outreach

Event Date	Event/ Event Location	Environmental Justice Event	Notes	Environmental Justice specific notes
4/28/2014	Survey work right of entry calls, Vibration testing flyering, Geotech flyering		Called property owners to notify them of upcoming survey work: 596, 588, 591, 598, 608, 593 Flyered residences nearby the following vibration test sites: SV-9, 10, 11a, 11b, 12, 13, 14 Flyered residences nearby the following geotech fieldwork locations: B03, A43, A44, A45	
4/24/2014	Seattle Latvian Church Coordination	✓	Continue conversations about project design and potential impacts.	
4/21/2014	Geotech flyering		Flyered residences nearby the following geotech fieldwork location: B04	
4/18/2014	Winter 2014 Kiosks	✓	Moved a kiosk to the North Seattle College. Kept the kiosks at the two other locations.	One whole panel included translated information about the project and selection of the preferred alternative.
4/17/2014	GovDelivery of Preferred Alternative Video Simulation		Posting the simulation online and subsequent announcement	
4/14/2014	Geotech flyering, Survey work right of entry calls		Flyered residences nearby the following geotech fieldwork locations: A52/53, A54, B01, B30, B31, B34, A35, C05-08 Called property owners to notify them of upcoming survey work: 510, 508, 480, 502, 476, 486	
4/7/2014	Geotech flyering, Survey work right of entry calls		Flyered residences nearby the following geotech field work locations: B18, B26, B27, B29 Called property owners to notify them of upcoming survey work: 545, 527, 556, 523, 552, 538	
3/28/2014	New Property Owner Letter		Letter sent to new property owners not previously identified in the Draft EIS, but may not be impacted as designs have been refined. Along with the letter, the Winter 2014 newsletter and real estate brochure were provided.	
3/26/2014	Winter 2014 Kiosks	✓	Moved a kiosk to the Shoreline Library. Kept the kiosks at the other two locations since people continue to take our folios	One whole panel included translated information about the project and selection of the preferred alternative.

7/18/2013	Briefing to Latvian Church Congregation	✓	DEIS briefing	Roger and Nytasha fielded questions and comments for 2.5 hours following their presentation. There were many excellent questions, some comments were a bit emotional but overall it was important to be there and take it on the chin from the greater church community. A church leader who served as moderator did a great job keeping things under control and was clear to point out that we have been working with them and have met with the Leadership group three times so far. Many came up to show their appreciation after the meeting. No media was present.

6/19/2013	Snohomish County Tomorrow		DEIS Briefing	
6/18/2013	Snohomish County Committee for Improved Transportation		ST3 Briefing	
6/5/2013	Meeting with the North District Council		A panel will provide updates regarding ST Light Rail and Transit Oriented Development for Northgate and points north, and how these latest developments may impact North Seattle. Also the community would like to know the points along the way where they may be engaged in the process and anticipate involvement.	
6/5/2013	Meeting with the Shoreline Council of Neighborhoods		This meeting is to discuss station area planning, specifically presenting information on the schedule of station area planning and public outreach; report from May 22 meeting and what's next; and overview of Sound Transit EIS process and schedule.

3/19/2013	Victory Heights Community Council Victory Heights Playfield Preschool Seattle		Attendees asked several good questions including: What will the construction impacts near us? How will the final decision be made on the route and stations? How will you decide how much parking to add at each station? What is the average cost of the system per mile? How will the project be funded?	
3/17/2013	General Outreach Traveling displays		New Hope of Seattle 3/17/2013 – 3/19/2013	
3/14/2013	Richmond Highlands and Highland Terrace Neighborhoods Richmond Highlands and Highland Terrace neighborhoods Shoreline		Only four members attended the meeting but were all interested and focused on the project (thanks for your heads up about the potential for this). Group chairs have promised to forward information received from email updates to their membership. Several asked good questions including ones about the decision making process, parking/parking policies and upcoming info that will be in the DEIS. We were joined by Steve Saffron from the city of Shoreline (station area planning lead).

Sound Transit also distributed the Final EIS to all parties commenting on the Draft EIS. Their names are listed in Appendix P.

Appendix N

Mitigation Plan

APPENDIX N – MITIGATION PLAN

The mitigation plan for Lynnwood Link Extension describes Sound Transit's preliminary mitigation commitments, which include all the mitigation measures Sound Transit proposes to implement to avoid or minimize impacts from the Preferred Alternative identified in the Final EIS. Many of the potential project impacts identified through the EIS process have been mitigated through incorporation of avoidance, minimization or improvement elements that are now included in the definition and design of the project. If the Sound Transit Board ultimately selects another alternative to build differing from the Preferred Alternative, the mitigation plan will be modified accordingly.

The mitigation measures described below are based on the potential mitigation measures identified in the Final EIS. Measures associated with the operation of Lynnwood Link (long-term impacts) are described first; measures associated with construction are described second. These mitigation measures are anticipated to be included as part of FTA's Record of Decision for the project, and would be tracked in a monitoring program to ensure that the mitigation commitments are being met and addressed.

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
3	Transportation	General Impacts	Long-term & Construction	The following sections discuss measures Sound Transit would take to mitigate the impacts of the light rail alternatives. They also describe measures that Sound Transit proposes to take but which require the agreement of other parties. For instance, Sound Transit has identified certain intersection improvements, traffic management, safety, and parking strategies to mitigate project-related impacts, but the agency does not have the sole authority to make those improvements when the facilities are owned and managed by others. Others may also have alternative plans or projects to address project future conditions with or without the project. In these cases, Sound Transit would coordinate with these other agencies and jurisdictions to further define and implement improvements to mitigate the Lynnwood Link Extension's impacts.
3	Transportation	Arterials and Local Streets	Long-term	The following intersection improvements will improve the AM and PM peak hour intersection delay to meet LOS standards, or to achieve the same level of service or better for intersections that will be below standards with the No Build Alternative. Sound Transit will provide these improvements or other improvements as agreed to by the local jurisdictions. In lieu of constructing the proposed improvements, Sound Transit could instead contribute to a local jurisdiction's project to improve intersection performance where the No Build Alternative would already be below standards, as agreed to with local jurisdictions.
3	Transportation	Arterials and Local Streets	Long-term	Segment A: North 185th Street and Meridian Avenue North (City of Shoreline): Add protected-permissive phasing to the northbound and southbound left turns.
3	Transportation	Arterials and Local Streets	Long-term	Segment A: NE 185th Street and 2nd Avenue NE (City of Shoreline): Add a two-way left-turn lane or refuge area on NE 185th Street.
3	Transportation	Arterials and Local Streets	Long-term	Segment C: 200th Street SW and 50th Avenue West (City of Lynnwood): Add overlap phase to northbound right-turn movement.
3	Transportation	Arterials and Local Streets	Long-term	Segment C: 200th Street SW and 48th Avenue West (City of Lynnwood): Add an eastbound and southbound right-turn pocket.
3	Transportation	Arterials and Local Streets	Long-term	Segment C: 52nd Avenue West and 204th Street SW (City of Lynnwood): Change traffic control from two-way stop control to signal or roundabout.
3	Transportation	Arterials and Local Streets	Long-term	Segment C: 200th Street SW and 44th Avenue West (City of Lynnwood): Add a second northbound left-turn lane and extend the eastbound right-turn pocket back to the park-and-ride driveway.
3	Transportation	Arterials and Local Streets	Long-term	Segment C: 200th Street SW and 50th Avenue West (City of Lynnwood): Add overlap phase to northbound right-turn movement.

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
3	Transportation	Arterials and Local Streets	Long-term	Segment C: 200th Street SW and 48th Avenue West (City of Lynnwood): Add an eastbound right-turn pocket and a southbound right-turn pocket.
3	Transportation	Property Access and Local Circulation	Long-term	In areas where property access and local circulation will be modified by the project, Sound Transit will work with local jurisdictions to develop plans to maintain safe and effective access and circulation. In areas near modified interchanges, FHWA and WSDOT would also be consulted.
3	Transportation	Property Access and Local Circulation	Long-term	To discourage cut-through traffic that may occur on residential streets in station areas, Sound Transit will work with local jurisdictions where such activity may occur and support the local agency in implementing measures, such as neighborhood traffic controls.
3	Transportation	Parking	Long-term & Construction	Where the project will remove off-street private parking spaces, Sound Transit will work with property owners to provide compensation or equivalent replacement parking.
3	Transportation	Parking	Long-term	For all stations Sound Transit will work with local jurisdictions to evaluate and, if necessary, implement hide-and-ride mitigation. Sound Transit will inventory on-street parking around each station before and after the start of light rail revenue service, and would then work with the local jurisdictions to determine where appropriate mitigation measures would be needed. Potential parking control measures include parking meters, restricted parking signage, passenger and truck load zones, and residential parking zone programs. Sound Transit will be responsible for the cost of installing the signage or other parking controls for 1 year after the light rail extension begins operation. The local jurisdiction will be responsible for monitoring, enforcing, and maintaining the parking controls.
3	Transportation	Safety	Long-term	To address potential safety concerns related to the placement of project structures in the I-5 right-of-way, Sound Transit will coordinate with FHWA and WSDOT during final design and to secure highway-related design approval.
3	Transportation	Transit	Construction	Sound Transit will mitigate the temporary loss of parking at park-and-ride lots through one or more of the following, determined in consultation with local jurisdictions, facility owners, and involved transit agencies: Implement service increases or other measures to encourage transit trips that do not require automobile access. Redirect transit riders that use these locations to other nearby park-and-ride lots. Develop temporary parking for transit riders to use during construction. Use construction phasing strategies to build new park-and-ride spaces before the loss

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				of existing spaces. Lease parking lots and/or new parking areas near the closed park-and-ride lots.
3	Transportation	Transit	Construction	Sound Transit will mitigate for partial closures of the Mountlake Terrace Transit Center and Lynnwood Transit Center by implementing one or more of the following, as appropriate, or other measures developed in coordination with transit agencies and local jurisdictions: Relocate transit stops to adjacent streets. Provide a temporary transit center at a nearby off-street location. Revise transit services (including temporary service between Mountlake Terrace and destinations in King County due to temporary closure of the Mountlake Terrace freeway station).
3	Transportation	Transit	Construction	Transit service mitigation measures for partial or full closures of streets will include rerouting of buses, where appropriate, to maintain transit service. Sound Transit will coordinate with local jurisdictions, King County Metro, Community Transit, and private transit service providers to minimize construction impacts and disruptions to bus facilities and services. Sound Transit will coordinate with those providers to inform passengers about changes with measures such as signage at existing transit stops, and using website information, rider information systems, emails, and agency mailing lists.
3	Transportation	Freeway Operations	Construction	As part of the WSDOT and FHWA approval process for construction within I-5 right-of-way and to minimize safety and operational impacts during construction, Sound Transit will collaborate with WSDOT and FHWA to develop and implement the project's Maintenance of Traffic plan.
3	Transportation	Freeway Operations	Construction	Sound Transit will coordinate construction with incident management, construction staging, and traffic control in places where the light rail construction will affect freeway traffic or involve changes to the roadside environment. Sound Transit will also coordinate with WSDOT to disseminate construction closure information to the public as needed.
3	Transportation	Arterials and Local Streets	Construction	Sound Transit will develop and implement detailed construction mitigation plans in coordination with local jurisdictions and WSDOT during the final design and permitting. To mitigate impacts to arterials and local streets, Sound Transit will: Develop the Maintenance of Traffic plan to conform to the *Manual on Uniform Traffic Control Devices* and jurisdictional agency requirements for traffic control. Use lighted or reflective signage to direct drivers to truck haul routes to ensure visibility

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				during nighttime work hours. Use temporary reflective truck prohibition signs on streets with a high likelihood of cut-through truck traffic. Communicate public information about construction activities through tools such as print, radio, posted signs, Web sites, email and direct communication with other agencies and affected parties; ongoing communications will update interested parties regarding street or freeway lane closures, detours, hours of construction, business access, and parking impacts. Coordinate access closures with affected businesses and residents. If access closures are required, property access to residences and businesses will be maintained to the extent possible. If access to the property cannot be maintained, the specific construction activity will be reviewed to determine if it could occur during non-business hours, or if the parking spaces and users of this access (for example, deliveries) could be provided at an alternative location. Require the contractor to provide parking areas for construction workers, where necessary. This may include remote parking with shuttle service to and from the construction site if sufficient on-site parking cannot be provided. Post signs prior to construction in areas where surface construction activities will affect access to surrounding businesses. Schedule traffic lane closures and high volumes of construction truck traffic during off-peak hours. Evaluate and limit concurrent construction to minimize construction impacts. Cover potholes and open trenches, where possible, and use protective barriers to protect drivers from trenches remaining open. Provide temporary parking to mitigate loss due to construction staging or work activities, as appropriate.
3	Transportation	Nonmotorized Facilities	Construction	Sound Transit will provide detour routes through construction areas. Sound Transit will also notify the public of these changes.
3	Transportation	Nonmotorized Facilities	Construction	Multi-use trails that might be affected by construction will generally be kept open. Detours will be provided when trails are closed, unless they are closed for short durations or in areas where a detour option is not feasible.
3	Transportation	Nonmotorized Facilities	Construction	Closures or restrictions of I-5 overcrossings will be sequenced to maintain travel across I-5 at the next nearest crossing.
3	Transportation	Freight Mobility	Construction	Sound Transit will work with local jurisdictions to develop and implement construction

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
		and Access		traffic control plans. The agency also will coordinate with affected businesses before and during the construction period to maintain business access as much as possible.
3	Transportation	Freight Mobility and Access	Construction	For construction associated with I-5, Sound Transit will coordinate with freight stakeholder groups by providing construction information to WSDOT for use in the state's freight notification system. Sound Transit will provide information in a format acceptable to WSDOT.
3	Transportation	Cumulative	Construction	Sound Transit will coordinate the construction activities of the Northgate Link Extension and Lynnwood Link Extension projects, and would also coordinate with the King County Metro TOD project to minimize impacts of overlapping construction periods.
4.1	Acquisitions, Displacements, and Relocations	Acquisitions, Displacements, and Relocations	Long-term	For property that is acquired for this project, Sound Transit will compensate property owners affected by the project, according to the provisions specified in Sound Transit's Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines; the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended; and the State of Washington's relocation and property acquisition law and regulations.
4.1	Acquisitions, Displacements, and Relocations	Acquisitions, Displacements, and Relocations	Construction	For temporary construction easements, in addition to just compensation, the property will be restored to its previous condition for the owner and/or another type of compensation will be employed as outlined during the easement's negotiation process.
4.1	Acquisitions, Displacements, and Relocations	Acquisitions, Displacements, and Relocations	Construction	If federally designated highway beautification areas are converted for project rights-of-way, Sound Transit will mitigate for these impacts by providing property along I-5 to replace the converted beautification areas, or with other measures as agreed by WSDOT and FHWA.
4.2	Land Use	Land Use	Long-term & construction	No specific mitigation is proposed.
4.3	Economics	Economics	Construction	Sound Transit will dedicate staff to work specifically with affected businesses during construction to minimize project-associated impacts. Construction mitigation plans will be developed to address the needs of businesses and will include, but are not limited to, the following measures: Provide a 24-hour construction telephone hotline. Provide business cleaning services on a case-by-case basis. Provide signage such as 'detour,' 'open for business,' and others as appropriate. Establish effective communications with the public through measures such as meetings and construction updates, alerts, and schedules. Implement promotion and marketing measures to help affected business districts

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				maintain their customer base, consistent with Sound Transit policies, during construction. Maintain access as much as possible to each business and coordinate with businesses during times of limited access. Provide a community ombudsman.
4.3	Economics	Economics	Construction	To avoid cumulative construction impacts, Sound Transit will coordinate construction mitigation planning with other project owners and potentially affected parties in construction areas with multiple projects in the same vicinity at similar times.
4.4	Social Impacts, Community Facilities, and Neighborhoods	Social Impacts, Community Facilities, and Neighborhoods	Long term & construction	No specific mitigation is proposed.
4.5	Visual and Aesthetic Resources	Visual and Aesthetic Resources	Long-term	Sound Transit will incorporate specific measures to mitigate visual impacts as it develops the detailed design. Mitigation measures will be focused on areas identified as having high visual impacts, and must be compatible with the project's maintenance and operations requirements. Sound Transit will adhere to the tree replacement and landscaping policies of WSDOT and local jurisdictions. A Roadside Master Plan will be developed in accordance with WSDOT guidelines for the portion of the route on the I-5 right-of-way. Sound Transit will mitigate conversion of WSDOT beautification areas along I-5 to right-of-way with replacement property, or with other measures agreed to by WSDOT and FHWA. Replacement parcels will meet the intended function of the original beautification area. In areas identified as having high visual impacts, Sound Transit would mitigate with landscaping or visual treatments to retaining walls and other structures, practical, as based on available land, safety, and maintenance and operation needs.
4.5	Visual and Aesthetic Resources	Visual and Aesthetic Resources	Construction	Sound Transit will shield light sources used in nighttime construction to reduce the lighting impacts. Sound Transit will design and place construction screens or barriers to limit the visibility of work areas that will intrude on adjacent activities such as public open space, community facilities, and recreational areas and trails, where practical.
4.6	Air Quality and Greenhouse Gases	Air Quality and Greenhouse Gases	Long-Term	No specific mitigation is proposed.

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
4.6	Air Quality and Greenhouse Gases	Air Quality and Greenhouse Gases	Construction	Consistent with Puget Sound Clean Air Agency requirements, Sound Transit will use best management practices (BMPs) to prevent and reduce air quality impacts resulting from construction activities. Construction activities must comply with local regulations governing air quality, including those for controlling fugitive dust during construction. The following mitigation measures will be used, as necessary, and in accordance with standard practice to control PM10, PM2.5, and emissions of CO and NOx during construction. Several of these measures will also reduce GHG emissions: Spray exposed soil with a dust control agent, such as water. Cover all transported loads of soils and wet materials before transport, or provide adequate freeboard (i.e., space from the top of the material to the top of the truck). Install wheel washes or manually wash truck wheels, where needed. Remove the dust and mud that are deposited on paved, public roads. Route and schedule high volumes of construction traffic, where practicable. Require appropriate emission-control devices on all construction equipment powered by gasoline or diesel fuel. Use well-maintained heavy equipment. Cover, install mulch, or plant vegetation as soon as practicable after grading. Encourage contractors to employ emission-reduction technologies and practices for both on-road and off-road equipment and vehicles (e.g., retrofit equipment with diesel control technology and/or use ultra-low sulfur diesel). Implement idling restrictions for construction trucks. Locate construction equipment and truck staging zones away from sensitive receptors, as practicable, and in consideration of other factors such as noise and safety.
4.7	Noise and Vibration	Noise	Long-Term	Noise mitigation measures will be provided consistent with Sound Transit's Light Rail Noise Mitigation Policy (Motion No. M2004-08). The FTA manual also defines when mitigation is needed and bases this on the impact's severity, with severe impacts requiring the most consideration. During final design, all predicted impacts and mitigation measures will be reviewed for verification. During final design, if it is discovered that equivalent mitigation can be achieved by a less costly means, or if the detailed analysis shows no impact, then the mitigation measure may be modified or eliminated. While the mitigation provided herein is based on predicted impacts, further noise mitigation will be provided if, after operations commence, noise impacts occur for which mitigation is deemed necessary and appropriate under FTA noise standards. When source mitigation measures, noise walls, or sound barriers are infeasible or not

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				entirely effective at reducing noise levels below the FTA impact criteria or applicable requirement, residential sound insulation will be evaluated and offered at properties where the existing building does not already achieve a sufficient exterior-to-interior reduction of noise levels.
4.7	Noise and Vibration	Noise	Long-Term	In Segment A replacement noise walls will range between approximately 6 and 24 feet in height to mitigate the combination of projected I-5 traffic noise levels resulting from the removal of the existing noise walls, changes to ramps and shielding, and light rail noise introduced by the project to below the impact criteria. Most noise impacts from light rail operating on an elevated structure will be mitigated by incorporating a 4- to 8-foot-tall barrier at the edge of the structure facing the noise-sensitive uses. Sound Transit will provide sound insulation where other standard measures that mitigate outdoor noise impacts are not completely effective. Mitigation for impacts from buses and cars operating in the NE 185th Street park-and-ride will include noise barriers along the edge of the facility, sound insulation, or revising the design of the facility to move access driveways and bus loading areas farther from residences. Based on the EIS analysis, mitigation for noise impacts in Segment A will include: Approximately 12,250 feet of relocated noise walls along I-5. Approximately 9,700 feet of additional noise walls. Approximately 530 feet of noise walls at NE 185th Street Station. Sound insulation will be offered at approximately 8 residences.
4.7	Noise and Vibration	Noise	Long-Term	In Segment B, at-grade noise walls will range between 4 and 10 feet above the track height, or from the top of retaining walls built as part of the project. Noise impacts from the elevated guideway will be mitigated with a 4- to 6-foot-tall barrier at the edge of the guideway structure to below the FTA criteria. Mitigation, such as a noise wall along the eastern edge of the facility, will mitigate impacts from buses serving the Mountlake Terrace Station park-and-ride. Based on the EIS analysis, mitigation for noise impacts in Segment B will include: Approximately 16,975 feet of additional noise walls. Approximately 400 feet of noise walls at Mountlake Terrace Station. Sound insulation will be offered at approximately 9 residences.
4.7	Noise and Vibration	Noise	Long-Term	In Segment C noise impacts will be mitigated by incorporating a 4- to 6-foot-tall barrier at the edge of the guideway structure. Based on the EIS analysis, mitigation for noise impacts in Segment C will include: Approximately 3,960 feet of noise walls for light rail noise.

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				Sound insulation will be offered at approximately 58 residences for traffic noise, and 1,275 feet of noise walls or insulation for 23 additional units.
4.7	Noise and Vibration	Noise	Long-Term	All curves of less than 1,000-foot radius near noise-sensitive uses will be designed to accommodate a track lubrication system that Sound Transit will install should wheel squeal occur during operation.
4.7	Noise and Vibration	Vibration	Long-Term	Vibration impacts will be mitigated by design measures that reduce the amount of vibration energy transferred from passing trains into the ground. The use of a tire-derived aggregate (shredded tires) in a layer below the track ballast is an effective measure to reduce vibration transfer; other measures, such as ballast mats, a resiliently supported track, high-compliance rail fasteners or column isolation, are also available and may be appropriate in some locations, such as on structures. Specific vibration-isolation designs to mitigate impacts to below the FTA criteria will be determined during final design.
4.7	Noise and Vibration	Noise and Vibration	Long-Term	Special trackwork, such as a moveable-point or spring frog will be used in place of a conventional frog where cross-overs (the point at which two rails cross) will otherwise cause a noise or vibration impact.
4.7	Noise and Vibration	Noise and Vibration	Construction	Where existing noise walls will require relocation, the relocation will be completed as early in the construction process as practical so that the relocated walls will reduce noise from the ongoing construction activities. When required, Sound Transit or its contractor will seek the appropriate noise variance from the local jurisdiction.
4.7	Noise and Vibration	Noise and Vibration	Construction	Construction noise and vibration control mitigation will include the following measures, as necessary, to meet required noise limits and minimize vibration: Install construction site noise barrier or noise wall by noise-sensitive receivers where feasible and appropriate. Use smart backup alarms during nighttime work that automatically adjust, or lower the alarm level or tone based on the background noise level, or switch off back-up alarms and replace with spotters. Use low-noise emission equipment. Implement noise-deadening measures for truck loading and operations. Monitor and maintain equipment to meet noise limits. Use lined or covered storage bins, conveyors, and chutes with sound-deadening material. Use acoustic enclosures, shields, or shrouds for equipment and facilities. Install high-grade engine exhaust silencers and engine-casing sound insulation.

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				Prohibit aboveground jack hammering and impact pile driving during nighttime hours. Minimize the use of generators or use whisper-quiet generators to power equipment. Limit use of public address systems. Use movable noise barriers at the source of the construction activity, where appropriate. Limit or avoid certain noisy or high vibration activities during nighttime hours. Demolish existing structures near vibration-sensitive receivers with methods that do not cause impact forces against the buildings or near them. Minimize use of vibratory soil compactors and vibratory hammers near vibration-sensitive receivers. Use oscillatory pile-casing techniques where appropriate. Avoid using variable-frequency vibratory hammers in dense residential areas, such as around the NE 130th Street, NE 145th Street, NE 155th Street, and NE 185th Street Stations. Avoid conventional vibratory hammers. An alternative to conventional vibratory pile drivers is a resonance-free vibrator or variable eccentric moment vibrator.
4.8	Ecosystem Resources	Environmentally sensitive resources	Construction	Sound Transit's construction contractor will implement construction BMPs that will apply to all work in or around sensitive areas. The construction contractor will work within construction limits marked with fencing and signage to prevent unintended impacts on riparian vegetation, wetlands, woodlands, and other sensitive sites outside of the construction limits.
4.8	Ecosystem Resources	Aquatic habitat	Construction	Temporary work trestles will be used in extremely sensitive areas, where practical, such as the Scriber Creek wetland complex.
4.8	Ecosystem Resources	Aquatic habitat	Construction	BMPs will be employed for fish and aquatic habitat protection. All work below the ordinary high water mark will comply with the terms and conditions set forth in the HPA issued by WDFW for the project.
4.8	Ecosystem Resources	Vegetation and wildlife	Long-term	Sound Transit will coordinate with WSDOT, local jurisdictions, and resource agencies conducting restoration projects in the area to minimize the potential for the presence of light rail facilities to interfere with future restoration projects.
4.8	Ecosystem Resources	Aquatic habitat	Construction	To reduce the risk of adverse effects on migrating salmonids, Sound Transit will require construction contractors to direct lighting away from fish-bearing waters and to place hoods or shields on lights, as needed, to minimize the amount of backlight or dispersed

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				light cast toward the water's surface.
4.8	Ecosystem Resources	Surface water	Construction	For water quality protection, the project will obtain and adhere to a construction stormwater general permit under the National Pollutant Discharge Elimination System (NPDES) permit program to reduce or eliminate stormwater pollution and other impacts on surface waters. A construction stormwater pollution prevention plan (SWPPP), approved by Ecology, will also be implemented before the start of construction. The plan will include BMPs to (1) prevent erosion, (2) prevent sedimentation, and (3) identify, reduce, eliminate, or prevent stormwater contamination and water pollution from construction activity. The construction stormwater pollution prevention plan will include a temporary erosion and sediment control (TESC plan) that includes BMPS such as silt fences; protective ground covers such as straw, plastic sheeting, or jute mats; and straw bales in drainage features; spill prevention, control, and countermeasures plan; concrete containment and disposal plan; dewatering plan; and a fugitive dust plan.
4.8	Ecosystem Resources	Vegetation and wildlife	Construction	Measures will be implemented before and during project construction to avoid or minimize effects on vegetation and wildlife resources such as minimizing vegetation clearing, restoring temporarily affected areas, and preparing and implementing a revegetation plan.
4.8	Ecosystem Resources	Vegetation and wildlife	Construction	In accordance with the Migratory Bird Treaty Act, Sound Transit will consult with the U.S. Fish and Wildlife Service on measures to avoid impacts on migratory birds. Measures likely to be required may include pre-construction surveys for migratory birds and/or restrictions on vegetation clearing during the breeding season for migratory birds. Except where hazard trees pose an immediate threat to light rail safety or reliability, vegetation maintenance and hazard tree removal will be conducted outside of the breeding season for migratory birds.
4.8	Ecosystem Resources	Vegetation and wildlife	Construction	Sound Transit will implement appropriate measures to minimize the risk of introduction and spread of noxious and invasive species, including restoring temporarily disturbed areas as soon as practical following construction activities.
4.8	Ecosystem Resources	Vegetation and wildlife	Construction	To minimize use of herbicides and fertilizers, restoration of disturbed areas will include the use of mulching, ground cover, and other planting strategies that discourage growth of undesirable species.
4.8	Ecosystem Resources	Stormwater runoff and flow	Long-term	Sound Transit will also implement design and operation BMPs for permanent stormwater runoff treatment and flow control. These will include natural or engineered dispersion BMPs; biofiltration BMPs such as vegetated filter strips, biofiltration swales, or ecology embankments; wet-pool BMPs; and infiltration BMPs. The project will route

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				drainage to maintain existing stream basin contributing areas.
4.8	Ecosystem Resources	Unavoidable impacts	Long-term	Long-term impacts on wetlands and wetland buffers will be mitigated through the use of available approved mitigation banks, the King County in-lieu fee program, or project-specific mitigation developed by Sound Transit. Compensatory mitigation will be implemented in accordance with applicable federal, state, and local requirements and guidelines. Mitigation for unavoidable impacts on streams, stream buffers, and wildlife habitat will comply with local critical areas ordinances. Sound Transit's actions to mitigate for impacts on wetlands and wetland buffers (e.g., planting native trees and shrubs near wetland areas) will help offset the loss of some habitat for wildlife and contribute to improved ecological function of nearby streams and stream buffers. Tree planting required for compliance with WSDOT's and local jurisdictions' tree protection rules will also mitigate for impacts on streams, stream buffers, and wildlife habitat. Potential sites currently under consideration for project-specific mitigation for impacts on wetlands and wetland buffers are: North Seattle Community College Campus Jackson Park Golf Course/5th Avenue NE NE 145th Street Vicinity NE 155th Street Station Vicinity Ballinger Lake Golf Course Scriber Creek Wetland Complex (Wetland WLY4)
4.9	Water Resources	Water Resources	Long-term & construction	The project would comply with all federal, state, and location regulations and apply all required BMPs to prevent or minimize long-term impacts, such as low-impact development (LID) approaches, where applicable, and stormwater flow control and water quality treatments as identified in Table 4.9-1 in the EIS. Sound Transit will mitigate construction impacts by complying with the NPDES Permit program, and implementing practices in its Construction Stormwater Pollution Prevention Plan.
4.10	Energy Impacts	Energy Impacts	Long-term & construction	No specific mitigation is proposed.
4.11	Geology and Soils	Geology and Soils	Long-term & construction	No specific mitigation is proposed. Sound Transit will use appropriate engineering design standards and BMPs to avoid adverse impacts.
4.12	Hazardous Materials	Hazardous Materials	Construction	To mitigate impacts from potential contaminated sites in the project area, Sound Transit will perform environmental due diligence for properties along the project corridor before property acquisition. Sound Transit will perform a Phase I Environmental Site Assessment (ESA) on properties to be acquired or that have substantial associated

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
				construction activities. A Phase II ESA might be necessary for property acquisition or for construction purposes if the Phase I ESA determines that the property has a likelihood of contamination. The results of these assessments could be used to establish the condition of acquisition properties and to determine plans for cleanup and construction management, as needed. Ecology will be notified if unknown contamination is encountered during an assessment. Some previously contaminated properties might require longer-term covenants, restrictions, or other remedial activities, which will be approved by Ecology.
4.12	Hazardous Materials	Hazardous Materials	Construction	To address potential impacts on environmental resources from construction activities, Sound Transit will implement applicable BMPs. These will include requiring contractors to prepare hazardous material management plans, construction stormwater pollution prevention plans, health and safety plans, spill control and prevention plans, contaminated media management plans, and lead and asbestos abatement programs, as necessary. These plans will establish the procedures for managing hazardous materials in accordance with state and federal regulations. To the extent practicable, Sound Transit will limit construction activities that might encounter contaminated groundwater or contaminated soil.
4.13	Electromagnetic Fields	Electromagnetic Fields	Long-term & construction	No specific mitigation is proposed.
4.14	Public Services	Public Services	Construction	Sound Transit will coordinate with the Shoreline Fire Department during final design to avoid construction impacts to Station No. 65, and to define measures to minimize impacts on response times and operations.
4.14	Public Services	Public Services	Long-term & construction	During final design and construction, Sound Transit will coordinate with the Edmonds School District to minimize property impacts on School District properties in Segments B and C.
4.14	Public Services	Public Services	Construction	Sound Transit will provide regular updates to schools, emergency service providers, local agencies, and postal services. It will also assist public school officials in providing advance and ongoing notices to students and parents about construction activity near schools.
4.15	Utilities	Utilities	Long-term & construction	Design standards and BMPs will minimize impacts. Coordination with utility providers and outreach to the public during construction and operation will minimize service disruptions and associated impacts. Sound Transit will conduct potholing and preconstruction surveys to identify utility locations. Sound Transit will follow safety protocols to protect the public and construction workers.

Table N-1. Mitigation Plan

EIS Chapter/ Section	Resource	Impact Topic	Period	Mitigation Description
4.16	Cultural, Archaeological, and Historic Resources	Cultural, Archaeological, and Historic Resources	Construction	To minimize the risk of damage to currently unknown archaeological resources, Sound Transit will develop an Inadvertent Discovery Plan prior to ground-disturbing construction activities. FTA and Sound Transit will coordinate with the State Historic Preservation Office (SHPO) and tribes to review the plan. In addition, archaeologists will conduct training for contractors to help them identify potential archaeological remains during construction; the training will also cover protocols to implement if something is discovered. If potentially significant archaeological materials or sites (or evidence thereof) are discovered during construction, activities will be halted around the find. All reasonable measures will be taken to avoid or minimize harm to the property until such time as FTA and Sound Transit, in consultation with the SHPO and the tribes, determine that appropriate measures have been taken to ensure that the project is in compliance with Section 106 of the National Historic Preservation Act. The Inadvertent Discovery Plan also will describe the procedures that Sound Transit and FTA will follow if any human remains are discovered during project construction.
4.17	Parks and Recreational Resources	Parks and Recreational Resources	Long-term	Ridgecrest Park: In coordination with the City of Shoreline, Sound Transit will provide landscaping and restoration of the affected area and place a barrier between the light rail facility and the park to function like the existing berm in buffering I-5 noise and views of I-5. The project will also design and rebuild 1st Avenue NE from NE 159th to NE 161st Street, in coordination with the City, and transfer replacement property at the south end of the park, or other property as agreed to with the City, consistent with the requirements of Forward Thrust. The replacement land will be developed to a level comparable to the displaced park area, and the design process will include outreach in the adjacent neighborhood to inform roadway and park design, in coordination with the City.
4.17	Parks and Recreational Resources	Parks and Recreational Resources	Construction	Shoreline Park and Stadium: Sound Transit will restore affected areas after construction, and will coordinate access improvements and construction activities with the Shoreline School District.
4.17	Parks and Recreational Resources	Parks and Recreational Resources	Construction	Trails: For all temporary trail closures or reroutes associated with construction, Sound Transit will coordinate with appropriate local jurisdictions to develop detours and to provide public information and signed detour routes during construction to allow for continued connections.

EXECUTIVE SUMMARY

The Central Puget Sound Regional Transit Authority (Sound Transit) is proposing to build and operate the Lynnwood Link Extension, which will expand the regional light rail system from Seattle to Lynnwood, Washington. The proposed project will be in the cities of Seattle and Shoreline in King County and in Mountlake Terrace and Lynnwood in Snohomish County. The light rail system will provide improved travel times and will increase transportation capacity in the heavily congested Interstate 5 (I-5) corridor. By 2035, approximately 68,000 transit trips are expected on the Lynnwood Link Extension each day, compared to about 34,000 trips using buses in the corridor north of Northgate if the project were not completed.

This biological assessment (BA) evaluates the potential effects of the Lynnwood Link Extension on listed species that might occur in the action area. The Lynnwood Link Extension will involve constructing approximately 8.5 miles of light rail from Seattle to Lynnwood. The proposed project includes guideways, stations, overhead electrification systems, traction power substations, parking structures, at-grade crossing improvements, modified roadways and interchanges, utilities, stormwater management facilities, and other associated new or modified structures to support the light rail system. The route is divided into the following three geographic segments:

- Segment A: Northgate to Shoreline
- Segment B: Shoreline to Mountlake Terrace
- Segment C: Mountlake Terrace to Lynnwood

Sound Transit has prepared this BA to facilitate consultation between the Federal Transit Administration (FTA) and the National Marine Fisheries Service (NMFS) and U.S. Fish and Wildlife Service (USFWS) under Section 7 of the Endangered Species Act (ESA) of 1973 (16 United States Code §§ 1531-1544). The primary federal nexus for this project is federal-aid funding provided by FTA, although other federal approvals by the Federal Highway Administration (for modifications to the Interstate system) and the U.S. Army Corps of Engineers are also anticipated. Project activities with the potential to affect ESA-listed animal species include those at locations where the elevated and at-grade alignment crosses streams or wetlands or their buffers. Listed species are not present at all stream crossings because, in most cases, fish access is blocked by impassable culverts downstream.

Potential construction-related (short-term) effects on ESA-listed species include the introduction of sediment or pollutants into surface waters, temporary loss or degradation of riparian habitat, and disturbance of fish in waters where in-water work occurs.

Potential operational (long-term) effects include permanent loss of wetland, riparian, and buffer areas resulting from the placement of elevated guideways and support columns, and increased velocities and durations of peak flows in action area streams due to increases in the amount of impervious surface in the action area. Beneficial long-term effects may include improvements to wetland, riparian, and buffer vegetation because many areas to be cleared for construction have been overtaken by invasive species, and these areas will be replanted with native species. Beneficial long-

term effects will also result from improved stormwater treatment and reduced growth in automobile traffic.

The species covered in this BA are Chinook salmon (*Oncorhynchus tshawytscha*), steelhead (*O. mykiss*), and bull trout (*Salvelinus confluentus*). No designated or proposed critical habitat for any of these species occurs in the action area of the project. Table ES-1 summarizes the effects determination of the Lynnwood Link Extension for each of these species. No effects on critical habitat are expected because no designated or proposed critical habitat is present in the action area for the Lynnwood Link Extension. The nearest designated critical habitat for all three species is in Lake Washington, which is more than 3 miles downstream of the action area.

The project was also evaluated for potential effects on essential fish habitat (EFH). Based on the finding that project construction, including implementation of the conservation measures identified in this analysis, is not expected to result in any permanent reduction of quantity or quality of EFH, there will be no adverse effect on EFH for Pacific salmon, groundfish, or coastal pelagic species covered in the fisheries management plans applicable to this region.

Table ES-1. Effects Determinations for ESA-Listed Species and Critical Habitat

Species	Status	Federal Jurisdiction	Effects Determination
Chinook salmon, Puget Sound ESU	Threatened	NMFS	NLAA
Chinook salmon critical habitat	Designated	NMFS	NE
Steelhead, Puget Sound DPS	Threatened	NMFS	NLAA
Steelhead critical habitat	Proposed	NMFS	NE
Bull trout	Threatened	USFWS	NE
Bull trout critical habitat	Designated	USFWS	NE

ESU–Evolutionarily Significant Unit
DPS–Distinct Population Segment
NE–No Effect
NLAA–Not Likely to Adversely Affect
NMFS–National Marine Fisheries Service
USFWS–United States Fish and Wildlife Service

1 INTRODUCTION AND PROJECT DESCRIPTION

The Central Puget Sound Regional Transit Authority (Sound Transit) has prepared this biological assessment (BA) to facilitate consultation between the Federal Transit Administration (FTA) and the National Marine Fisheries Service (NMFS) and U.S. Fish and Wildlife Service (USFWS) under Section 7 of the Endangered Species Act (ESA) of 1973 (16 United States Code §§ 1531-1544). The primary federal nexus for this project is federal aid funding provided by FTA, although the Federal Highway Administration (FHWA) also must approve any modifications to Interstate 5, which this project generally follows. This BA also supports ESA Section 7 compliance for the U.S. Army Corps of Engineers' (Corps) issuance of a permit under Section 404 of the federal Clean Water Act.

Sound Transit and FTA prepared a Draft Environmental Impact Statement (Draft EIS) that evaluated a No Build Alternative and several build alternatives (Sound Transit and Federal Transit Administration 2013). Through that analysis process, Sound Transit identified a Preferred Alternative, which is evaluated in this document and the Final EIS.

The ESA Section 7 requires federal agencies to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of listed species or species proposed for listing as endangered or threatened under the ESA or result in the destruction or adverse modification of critical habitat for those species. This BA evaluates the potential direct and indirect effects of the Lynnwood Link Extension on species that are listed, or proposed to be listed, as endangered or threatened under the ESA, and that are regulated by NMFS or USFWS (collectively referred to as the Services). Analyses in this document also address potential effects on designated or proposed critical habitat for ESA-listed species. Effects on essential fish habitat (EFH), as defined by NMFS (2004), are also examined in this document (Appendix A).

This BA addresses direct and indirect project-related impacts on Chinook salmon, steelhead, and bull trout. Effects analyses address potential effects on individuals, habitat, and the foraging base for each species. The effects determinations are based on life history analysis, habitat requirements, literature review, agency consultation, and field reconnaissance studies conducted by biologists. Biological information for species covered in this BA can be found in Appendix B.

The proposed project involves constructing approximately 8.5 miles of light rail from Seattle to Lynnwood (Figure 1-1), generally along I-5. The Lynnwood Link Extension includes guideways, stations, traction power substations, parking structures, at-grade crossing improvements, and other associated structures to support the light rail system. The route is divided into three geographic segments, as follows:

- Segment A: Northgate to Shoreline (Figures 1-2 and 1-3)
- Segment B: Shoreline to Mountlake Terrace (Figures 1-3 and 1-4)
- Segment C: Mountlake Terrace to Lynnwood (Figure 1-4)

Construction methods and structures being proposed in each segment will be similar. The first part of this chapter describes common construction methods and proposed structure types. Subsequent sections in this chapter describe activities where each rail segment intersects with sensitive areas that could potentially support ESA-listed species in the action area.

The project area is in Water Resources Inventory Area (WRIA) 8 (Lake Washington/Cedar/ Sammamish). Most of the project area is in Hydrologic Unit Code (HUC) number 171100120400, Lake Washington-Sammamish River; the northern end of the project area is in HUC number 171100120303, Swamp Creek.

The Lynnwood Link Extension is part of the implementation of Puget Sound Regional Council's VISION 2040 and the Sound Transit 2005 Regional Transit Long-Range Plan. The purpose of the Lynnwood Link Extension is to expand the Sound Transit Link light rail system from Northgate in Seattle north into Shoreline, Mountlake Terrace, and Lynnwood in Snohomish County in order to:

- Provide reliable, rapid, and efficient peak and off-peak transit service of sufficient capacity to meet the existing and projected demand for travel to and from the corridor communities and other urban centers in the Central Puget Sound area.
- Create an alternative to travel on congested roadways, and improve connections to the regional multimodal transportation system.
- Support the adopted land use, transportation, and economic development plans of the region and the corridor communities.
- Advance the long-range vision, goals, and objectives for transit service established by the Sound Transit Long-Range Plan for high-quality regional transit service connecting major activity centers in King, Pierce, and Snohomish counties.
- Implement a financially feasible system that seeks to preserve and promote a healthy environment.

1.1 General Construction Activities

The construction methods discussed below represent construction techniques and operations identified during preliminary engineering design. Specific construction methods will vary depending on site conditions and final design of the structures proposed. Construction of linear projects is typically divided into various segments or line sections based on similarities in configurations such as at-grade, elevated structures, or retained-cut/fill sections. Typical construction activities include:

- Demolition (buildings, pavement)
- Clearing and vegetation removal
- Fill and excavation
- Installing drainage systems, electrical systems, and communication systems
- Elevated structure construction
- At-grade track construction
- Retained cut construction
- Station and park-and-ride construction
- Roadway construction, sidewalk construction, and landscaping
- Utility relocation
- Retaining wall construction
- Driving or augering piles
- Deep shaft drilling
- Truck hauling and delivery of materials and equipment
- Dewatering
- Use of concrete batch plant
- Remediating any unexpected hazardous material areas
- Planting and revegetation

Typical construction equipment used to complete the Lynnwood Link Extension will include:

- Trucks (e.g., haul, service, delivery, and tractor trailers)
- Cranes
- Backhoes, loaders, compactors, and excavators
- Grading and paving equipment
- Vibratory equipment
- Drilling rigs and pile driving equipment

- Forklifts and manlifts
- Jackhammers
- Pumps (e.g., concrete, dewatering)
- Compressors, generators and welding equipment
- Demolition equipment
- Gantries

1.2 Construction Schedule

The construction duration will be approximately 6 years, including civil construction, systems installation (e.g., power and communications), testing, and startup activities. The schedule calls for a period of civil construction during which site preparation, primary construction, and final construction will take place. Construction durations will range from approximately 2 to 5 years in any given portion of the corridor. However, most ground-disturbing activities and heavy construction (development of structures, etc.) will occur in the initial phases of construction, with station completion and systems installation occurring in subsequent construction phases. Construction is scheduled to begin in 2018, with service commencing in 2023.

Typical construction for at-grade and elevated guideways and stations will occur on a 5- to 6-day work week schedule, primarily between 7 a.m. and 10 p.m. In some locations (primarily when existing traffic lanes may be affected) additional shifts, all-week, nighttime, or 24-hours/day construction activities may be implemented.

1.3 Structure Types

The proposed route and station configurations vary in profile, sometimes constructed at-grade, in a retained cut or fill, or elevated on columns. Because each of the three Lynnwood Link Extension segments includes similar structure types and construction methods, these structure types are described below.

Safety considerations require that vegetation be cleared near all guideways, necessitating a tree-clear zone within 20 feet of the structure at the time of construction. After construction, low-growing vegetation such as native shrubs can be planted within the tree-clear zone. The tops of mature plants are required to be at least 5 feet clear from the bottom of the structure. Where trees are planted outside the guideway, permanent vegetation will be pruned back to a clear zone between the edge of the guideway and the edge of the tree canopy for trees with mature heights less than the top of the safety railing. Where tree heights will reach above the height of the safety railing, a larger clear zone from the edge of the guideway to the edge of the tree canopy must be provided.

1.3.1 At-Grade

The term "at-grade" means that the rail line is located at street or surface level; for this project, an at-grade alignment is usually at the same level as the I-5 traffic lanes. At-grade guideways are typically

30 to 40 feet wide, with room for two sets of tracks. This width also includes room for the poles and overhead catenary wires needed to power trains. Light rail operating at grade is best suited in areas where the grade is 5 to 6 percent or less and there is adequate room within street rights-of-way or off-street corridors.

At-grade light rail construction methods and impacts are similar to typical road construction. Shallow, near-surface excavations will be required to construct the subgrade and track and station platform slabs for at-grade segments. In areas where access is not available from existing roads, a temporary construction road will be built. During the grading phase, the contractors will install drainage structures and below-grade light rail infrastructure.

1.3.2 Retained Cut and Retained Fill

Variants of the at-grade profile are retained cut, where the guideway is cut into the ground with a retaining wall on one or both sides, and retained fill, where the guideway is constructed on fill material supported by retaining walls. Retained cut and retained fill will be used where necessary to meet train operation grade requirements or to separate the grade below heavily traveled roadways. Construction of retained cut structures will consist of excavation of soil and sidewall stabilization, and construction of the bottom grade and guideway and sidewalls. Excavation depth is expected to vary based on topography of the area. Some dewatering may be required during excavation and construction. Construction of retained fill structures will include construction of retaining walls and placement of fill material between the walls to provide a surface for the guideway. As with other at-grade segments, retained cut and retained fill structures are typically 30 to 40 feet wide.

1.3.3 Elevated Profile

Elevated guideways and stations for light rail, similar to structures such as highway bridges, are generally constructed with reinforced concrete, steel, or combinations of both. Elevated guideways are typically about 30 feet wide and can vary in height. Light rail on elevated structures works well where the system must be grade-separated to cross over geographic or physical barriers, or accommodate higher train frequencies.

Construction will begin with preparation work to build foundations that may consist of shallow spread footings, drilled shafts, or deep-driven (augered) piles. Construction varies with type of foundation needed, which is based on soil conditions and the height of the structure. Spread footings require excavation, backfilling, and compaction, followed by installation of reinforcing steel and pouring of concrete. Drilled shafts are constructed using a vibratory or rotating drill rig to advance a permanent casing (steel or concrete) into the ground while soil from inside the casing is excavated. During excavation, a bentonite or synthetic polymer slurry is sometimes added to stabilize the walls of the shaft. When the shaft is of the desired depth, rebar reinforcement is placed in the shaft and concrete is poured with a tremie hose. Depending on location, dewatering of the shafts may be required before concrete is poured. With deep-driven piles, an auger is used that has a hollow center for pumping concrete. The auger is driven to a specified depth, then as it is pulled

back up, concrete is pumped into the void. Rebar reinforcement is placed into the concrete before it sets. This method is used in areas with drier soils.

Transitions between at-grade and elevated profiles are typically supported by compacted fill ramps. An elevated profile must have a minimum clearance of at least 16.5 feet over roadways, but topography and other consideration may result in a profile as high as 50 feet or more. Pier supports are typically 6 feet by 9 feet square at the ground, although the support structure below the ground may be larger. Just as for at-grade routes, the elevated guideway can travel either in the median of existing roadways, along the side of the roadway, or in off-street corridors.

Construction of an elevated guideway involves demolition of infrastructure in the project area, relocating utilities, and preparing necessary construction access. In undeveloped or other open areas, clearing, grubbing and grading will be needed. A temporary construction road will typically be built (in this corridor, generally along I-5) when constructing an elevated guideway in undeveloped areas or where access is not available from existing roads.

Falsework may need to be constructed in some areas where concrete is cast in place or to stabilize balanced cantilevered sections. Falsework may consist of pile-supported work platforms, which in turn support scaffolding and concrete forms.

Temporary work trestles will be needed for equipment access during construction of the elevated guideway where the proposed alignment crosses the Scriber Creek wetland complex. Trestles will consist of pile-supported platforms, one extending from upland areas southwest of the wetland complex and the other extending from the Lynnwood Transit Center northeast of the complex. The temporary work trestles will be about 30 feet wide, with heavy timber decking supported by steel beams. Pile bents (lateral rows of three to four piles) will be spaced at 30- to 50-foot intervals, with each pile driven below the mudline to a depth sufficient to support the large cranes and other equipment needed for construction of the elevated guideway. The spacing of the pile bents will be optimized to reduce the number of piles needed while providing sufficient structural support.

A vibratory hammer will be used for initial installation of most piles. If substrates preclude the use of a vibratory hammer, an impact hammer will be used. For all piles, an impact hammer will be used to complete the installation and to confirm the load-bearing capacity of each pile. Any work below the ordinary high water mark of Scriber Creek will be conducted in accordance with the terms of the Hydraulic Project Approval (HPA) and other applicable permits obtained for this project.

1.3.4 Stations

The project design includes four stations, with options to develop two others. Stations are designed according to the profile of the route. Depending on the location, stations are designed with center or side platforms. A station platform is typically 400 feet long to accommodate a four-car train but varies in width depending on the location of the platform, passenger volumes, vertical and horizontal circulation needs, and the track profile. The size of each station is determined by the site-specific access and parking requirements.

Escalators, elevators, and stairs will provide access to station platforms. Stations will include pedestrian and bicycle access to and from feeder bus lines, park-and-ride facilities, and surrounding streets. The station plans also include proposed bus stops, paratransit stops, and handicapped-accessible areas. Most of the stations will have parking areas for transit patrons in either a structure or a surface lot. At several station locations, the existing transit facilities already include park-and-ride lots that will be expanded or reconfigured. Two of the stations are at existing transit centers with major park and ride facilities. One is at an existing freeway flyer transit stop with an adjacent parking lot, and the fourth would create a new station and park-and-ride.

1.3.5 Traction Power Substations

Electric power for the trains will be provided from an overhead catenary system connected to the existing electrical grid through traction power substations. The traction power substations are completely enclosed small buildings, about 20 feet by 60 feet in size, with an additional 10 to 20 feet required around each unit. These electric substations will be installed at about 2-mile intervals. Automobile access is also required for each traction power substation for maintenance. When possible, they will be placed in the footprint of a light rail station or trackway or adjacent to the track where remaining right-of-way is available.

Traction power substations in Segment A will likely be installed at 120th Street NE and near the stations at NE 145th Street and NE 185th Street. The option for a station at NE 130th Street would also involve a traction power substation. In Segment B, substation are proposed at the Mountlake Terrace Transit Center and near 212th Street SW. Segment C includes one substation at the Lynnwood terminus.

1.3.6 Staging Areas and Construction Easements

Construction staging areas are needed before, during, and for a short time after construction work occurs. Staging areas will be used for construction equipment storage, construction materials delivery and storage, demolition materials or spoils handling (in accordance with applicable regulations), contractor trailers, access roads, and construction crew parking. At-grade, elevated, and retained cut-and-fill line sections will have construction staging areas along the routes. Where roadway right-of-way does not already exist, a corridor (encompassing the permanent light rail right-of-way) approximately 70 feet wide may be needed to construct the route, although narrower corridors can be used for construction to help minimize impacts or avoid other constraints. Contractors will generally use the property in which the facility is being constructed and property that has been acquired for right-of-way or other properties as negotiated by the contractor.

Construction easements are obtained for temporary use of property during construction and will be required in numerous locations along the route. In undeveloped land areas, easements up to 70 feet wide may be necessary to maneuver equipment and materials along the corridor during construction.

1.4 Description of Route and Project Activities by Segment

The following sections describe specific alignments and construction techniques for each segment. Photos of work areas within each segment, including proposed stream crossing areas, can be found in Chapter 4, Environmental Baseline.

1.4.1 Segment A: Northgate to Shoreline

Segment A (Figures 1-2 and 1-3) will extend approximately 4.2 miles, from the tail tracks for the Northgate Link Extension in Seattle north to NE 185th Street in Shoreline. The segment will include approximately 1.4 miles of elevated guideway and 2.8 miles of at-grade guideway. Alignment construction will entail reconstruction of both the off-ramp from northbound I-5 to NE 130th Street and the NE 130th Street overpass over I-5, along with a short section of 5th Avenue NE. The existing northbound on-ramp to I-5 at NE 145th Street will be relocated to the north, and the existing transit ramps at that interchange will be closed. Project construction will entail the reconstruction of several roadways, including 3rd Avenue NE, 1st Avenue NE, and 5th Avenue/7th Avenue NE.

Two stations are currently planned within this segment: an elevated station with a new 500-car parking garage at NE 145th Street and an at-grade station with a new 500-car parking garage at NE 185th Street. Sound Transit is also reviewing options for a third station at NE 130th Street, but a new parking facility is not included.

The route will cross the North Branch of Thornton Creek as an elevated guideway near the Jackson Park Golf Course, where the stream emerges from a pair of 1,500-foot-long culverts under I-5 before entering a pair of 48-foot-long culverts under 5th Avenue NE, approximately 4.2 miles upstream of the mouth of Thornton Creek. According to the Washington Department of Fish and Wildlife (WDFW), no ESA-listed species are known or expected to be present in this reach of Thornton Creek (WDFW 2014b). However, based on the observation of an adult steelhead near Twin Ponds upstream of the proposed crossing site (Tetra Tech/KCM 2004b), it is possible that steelhead may use stream habitats in that area.

No in-water work will be needed in Thornton Creek because all guideway support columns will be located above the ordinary high water mark of the stream. One support column will be placed approximately 40 feet from the stream (south of where the stream enters the culverts under 5th Avenue NE) and one straddle bent, with two support columns, will be placed approximately 20 feet north of where the stream emerges from the culverts under I-5. The elevated guideway will run parallel to the stream, partially spanning a surface-flowing segment of Thornton Creek approximately 100 feet long. Approximately 0.4 acre of the riparian buffer for Thornton Creek (as defined by the City of Seattle Critical Areas Ordinance, Seattle Municipal Code 25.09) falls within the guideway footprint.

Approximately 300 feet south of Thornton Creek's crossing under 5th Avenue NE, the elevated guideway will run parallel to a tributary to Thornton Creek (called Stream SSE1 for this analysis) but will not cross the watercourse. Two support columns will be placed approximately 30 feet from the

watercourse, one at either end of the surface-flowing segment. Approximately 0.2 acre of the riparian buffer for Stream SSE1 (provided the watercourse is classified as a potentially fish-bearing stream by the City of Seattle) falls within the guideway footprint.

1.4.2 Segment B: Shoreline to Mountlake Terrace

Segment B (Figures 1-3 and 1-4) will extend approximately 3.2 miles, from NE 185th Street in Shoreline north to 212th Street SW in Mountlake Terrace. The segment will include approximately 1.7 miles of elevated guideway and 1.5 miles of at-grade guideway. An elevated station with reconfigured surface parking is planned at the Mountlake Terrace Transit Center (236th Street SW), with another optional elevated station and 200-space surface parking area at 220th street SW. North of the transit center, the route will cross over I-5 and continue along the west side of the freeway.

The route will cross McAleer Creek as an elevated guideway where the stream emerges from a 400-foot culvert under I-5, approximately 3.5 miles upstream of the stream's mouth at Lake Washington. The elevated guideway will cross through the riparian buffers of two segments of McAleer Creek where it flows at the surface through cloverleaf interchanges between I-5 and State Route (SR) 104. Both Chinook salmon and steelhead may use stream habitats in these stream reaches (WDFW 2014b).

The elevated guideway will also cross through the riparian buffer of a small watercourse (provisionally called Stream SSH4) that emerges from a culvert in the cloverleaf interchange between eastbound SR 104 and northbound I-5, flows approximately 30 feet, and then joins McAleer Creek. The SSH4 riparian buffer is entirely contained within the McAleer Creek buffer. No in-water work will be needed in McAleer Creek because all guideway support columns will be located above the ordinary high water mark of the stream. Three support columns will be placed within 100 feet of surface-flowing segments of the stream: one approximately 70 feet from the ordinary high water mark and two approximately 100 feet from the ordinary high water mark. Approximately 0.6 acre of the riparian buffer for McAleer Creek (as defined by the critical areas ordinances of Shoreline [Shoreline Municipal Code 20.80.470] and Mountlake Terrace [Mountlake Terrace Municipal Code 16.15.080]) falls within the guideway footprint.

South of the McAleer Creek crossing, the route crosses a non-fish-bearing tributary to McAleer Creek (Stream SSH2). The entire length of this watercourse through the project area is contained in a culvert. Construction of the elevated guideway at this location will not entail any in-water work, nor will it affect any vegetation within the riparian buffer of any surface-flowing segments of the stream.

North of the McAleer Creek crossing, a short distance south of the Mountlake Terrace Transit Center, the route crosses an intermittently flowing, non-fish-bearing tributary to McAleer Creek (Stream SMT1). The alignment will be elevated at the crossing location. A portion of one guideway support column will be below the ordinary high water mark of the watercourse. All work within the stream channel will be conducted in accordance with the HPA and other permits that will include provisions designed to avoid or minimize the potential for adverse effects on habitat in receiving waters. Such provisions could include restrictions on construction periods below the ordinary high-

water mark and/or other measures designed to avoid or minimize the potential for construction activities to deliver sediment or pollutants to streams. Another support column will be placed approximately 40 feet from the ordinary high water mark. Approximately 0.5 acre of the riparian buffer for Stream SMT1 (as defined by Mountlake Terrace Municipal Code 16.15.080) falls within the guideway footprint.

1.4.3 Segment C: Mountlake Terrace to Lynnwood

Segment C (Figure 1-4) will extend approximately 1.0 mile, from 212th Street SW in Mountlake Terrace north to the Lynnwood Transit Center. The segment will include approximately 0.7 mile of elevated guideway and 0.3 mile of at-grade guideway. The alignment will be on the west side of I-5, leaving the right-of-way near 208th Street SW and then heading generally northward to an elevated station at the south side of the existing Lynnwood Transit Center. Existing surface parking areas displaced by station construction will be replaced by a new parking garage that will accommodate an additional 500 vehicles. Sound Transit is considering an option that would maintain 400 spaces on the existing surface parking lot to the south of the transit center, rather than converting the area for bus layover and circulation.

The route will cross Scriber Creek as an elevated guideway in the wetland complex immediately west of the Lynnwood Transit Center, approximately 2.6 miles upstream of the stream's confluence with Swamp Creek. No ESA-listed species are known or expected to use habitats in this stream reach (WDFW 2014b), which is approximately 2,900 feet upstream of a total barrier to fish passage.

The guideway will require 3 pairs of columns to cross the wetland complex. Some work below the ordinary high water mark of Scriber Creek may be required to construct the elevated guideway. Work areas where surface water is present will be isolated from other surface waters using a coffer dam or similar system to prevent suspended sediment or pollutants from leaving the work area. Approximately 0.6 acre of the riparian buffer Scriber Creek (as defined by the City of Lynnwood Critical Areas Ordinance, Lynnwood Municipal Code 17.10.060, based on the preliminary determination that the ordinary high water mark of the stream coincides with the outer boundary of the Scriber Creek wetland complex) falls within the guideway footprint.

As described in Section 1.3.3 (Elevated Profile), temporary work trestles will be needed for equipment access during construction of the elevated guideway where the proposed alignment crosses the Scriber Creek wetland complex. It is estimated that the total length of the temporary work trestles will be no more than 420 feet (one 100-foot-long trestle from the west, one 200-foot-long trestle from the east, and three 40-foot-long transverse trestles). Based on those length estimates, a maximum of 88 30-inch diameter steel piles may be installed in the Scriber Creek wetland complex while project construction is underway. Any in-water work for temporary work trestle construction (including impact pile driving, if necessary, as well as pile removal) will be conducted in accordance with the terms of the HPA and other applicable permits obtained for this project.

A non-fish-bearing tributary to Scriber Creek (Stream SLY1) flows through a narrow wooded area immediately east of the proposed location of the station at the Lynnwood Transit Center. The

project footprint does not intersect this stream. All project construction activities within 200 feet of Stream SLY1 will occur in currently paved portions of the transit center and therefore will not have any potential to affect the stream or its riparian buffer. It is possible, however, that the volume and pollutant loading levels of stormwater discharges to the stream could decrease when elevated light rail facilities are built above existing surface parking areas at the transit center (see Section 1.5.2, Pollutant-Generating Impervious Surface).

1.5 Stormwater Management for all Segments

For water quality protection, the project will obtain a construction stormwater general permit under the National Pollutant Discharge Elimination System (NPDES) permit program to reduce or eliminate stormwater pollution and other impacts on surface waters. The project will also develop a construction stormwater pollution prevention plan that implements best management practices (BMPs) for identifying, reducing, eliminating, or preventing sediment and erosion problems on site. The construction stormwater pollution prevention plan will include a temporary erosion and sediment control (TESC) plan; spill prevention, control, and countermeasures (SPCC) plan; concrete containment and disposal plan; dewatering plan; and a fugitive dust plan.

Conceptual engineering has been completed for the major stormwater detention and treatment facilities necessary for the Preferred Alternative. Sound Transit used a conservative approach in developing drainage concepts. Sound Transit applied the Western Washington Hydrology Model, Version 3.0, to analyze project hydrology and to determine sizing of the facilities. Detention facilities were designed to achieve post-project stormwater flows equivalent to forested conditions, as required by the Washington State Department of Ecology (Ecology). Most stormwater is expected to be discharged to existing city drainage facilities that discharge to water bodies from existing permitted municipal discharge locations.

1.5.1 Impervious Area

New impervious areas resulting from the Lynnwood Link Extension will include tracks and guideways, stations, park-and-ride lots, and roads (Table 1-1). Ballasted (i.e., gravel) track sections were counted as impervious areas by definition in accordance with the *Stormwater Management Manual for Western Washington* (Volume 1, Section 2.3). Relocated roads to accommodate the Lynnwood Link Extension were also counted as project-associated impervious area because the new and replaced pavement will require stormwater treatment and detention. For those cases where elevated track will overlay a relocated road, the underlying impervious area of the road was not counted in the impervious area numbers (to avoid double-counting). Existing impervious area of 226 acres was obtained from new surveyed base maps. The project will increase the amount of impervious surface in the action area by 52 acres (approximately 26 percent), mostly as a result of the new guideway covering existing grassy right-of-way areas.

Table 1-1. Existing and Proposed Amounts of Total and Pollutant-Generating Impervious Surface (acres)

Segment	Existing Impervious Area	Proposed Impervious Area	Net Change	Existing PGIS	Proposed PGIS	Net Change
A	90	121	+ 31	79	83	+ 4
B	69	86	+ 17	64	63	- 1
C	67	71	+ 4	55	53	- 2
Total	**226**	**278**	**+ 52**	**198**	**199**	**+ 1**

PGIS = pollutant-generating impervious surface

1.5.2 Pollutant-Generating Impervious Surface

Project pollutant-generating impervious surface (PGIS) is composed primarily of frontage roads and intersections near the project route that will need to be reconstructed to accommodate the light rail tracks. PGIS also includes bus holding areas, access roads, and parking areas at the park-and-ride lots constructed for the project.

Light rail guideways and stations have no motor vehicle traffic or other sources of pollutant-generating activities and are therefore classified as non-PGIS. Small amounts of non-toxic lubricant may be used on sections of light rail track in order to prevent operational noise from wheel squeal. Given the non-toxic nature of this product and small quantities anticipated to be used, track lubricant activities are not considered pollutant-generating. No stormwater treatment facilities are required in the non-PGIS areas.

In some areas, especially in Segment C, existing pollutant-generating segments of I-5 and commercial parking areas will be spanned by elevated portions of light rail. In these areas, precipitation that might otherwise have fallen on PGIS will fall instead on the non-pollutant-generating surface of the elevated guideway. The result will, in effect, be a conversion from pollutant-generating to non-pollutant-generating impervious surface, thus reducing the overall amount of PGIS in some portions of the project area (Table 1-1). Overall, project construction will result in a minimal change in the amount of PGIS in the action area because most of the proposed road segments and parking lots will be located in areas with similar existing uses.

1.5.3 Stormwater Flow Control and Treatment

The Lynnwood Link Extension will comply with the following local design manuals:

- Washington State Department of Transportation (WSDOT) 2014 Highway Runoff Manual
- City of Seattle: City of Seattle Flow Control and Water Quality Treatment Technical Requirements Manual, Volume 3
- City of Shoreline: Stormwater Management Manual for Western Washington (Ecology 2012a); City of Shoreline 2012 Engineering Development Manual; Low Impact Development, Technical Guidance for Puget Sound (Hinman 2012)
- City of Mountlake Terrace: Stormwater Management Manual for Western Washington (Ecology 2012a)

- City of Lynnwood: Stormwater Management Manual for Western Washington (the City currently uses the 2005 manual but is expected to adopt the 2012 manual by the time project design is underway)

Sound Transit's preliminary engineering for the Lynnwood Link Extension includes development of a conceptual layout for major stormwater facilities that are sized to comply with Sound Transit's 2012 *Design Criteria Manual*, which requires stormwater facilities for Sound Transit projects to conform to the requirements of local jurisdictions. Based on the guidance provided in Sound Transit's *Design Criteria Manual*, low-impact development (LID) is a preferred method of stormwater management and will be employed wherever possible. In addition, Ecology's 2012 *Stormwater Management Manual for Western Washington* requires LID approaches to stormwater management to the extent feasible. Stormwater management facilities will be designed using sustainable, LID approaches where possible, referencing the above manuals and the *Puget Sound LID Manual* (Hinman 2012) as guidance. However, in areas where use of LID measures is not feasible due to physical site constraints, other techniques will be used. A detailed discussion of the requirements applied and the proposed facilities is presented in the Lynnwood Link Extension Conceptual Design Report - Appendix G: Drainage Plan Report Technical Memorandum (Sound Transit 2012).

To minimize the potential impacts of increased impervious surface, stormwater detention facilities will be constructed as part of the Lynnwood Link Extension. The volume detained will be sufficient to offset any increase in impervious surface area in each segment. Based on the implementation of these BMPs, combined with compliance with the guidance documents identified above, peak flows are not expected to increase in any of the streams in the study area as a result of the project; moreover, base flows will be expected to remain similar to current conditions. Stormwater from all project-related impervious surface will receive appropriate flow control where required. Stormwater flow control techniques may include detention ponds, infiltration ponds, vaults, and dispersion.

Runoff from PGIS areas will typically require basic water quality treatment, with a goal to remove at least 80 percent of total suspended solids. Water quality treatment techniques may include bioretention, ecology embankments, and media filter vaults. Treatment to remove metals, oil, and grease will be provided at parking lots and roadway areas where required. Roadways where average daily traffic volume exceeds 7,500 vehicles will receive enhanced treatment, as will drainage outfalls that do not discharge to basic treatment water bodies. The specific stormwater management facilities used will depend on the conditions at the site. Typical facilities will likely consist of media filters or bioinfiltration facilities (i.e., rain gardens), but some stormwater wetlands may be installed where feasible.

All runoff is considered PGIS except for runoff from light-rail-only impervious surface (such as at-grade or elevated guideways and stations), sidewalks, and roofs. All PGIS will receive on-site water quality and flow control treatment before being discharged into municipal storm sewer systems. LID treatment methods will be encouraged and used wherever feasible. Some LID methods may include permeable pavement, rain gardens, bioretention planters, and dispersion/infiltration.

Where practical, non-PGIS runoff will be conveyed separately from PGIS runoff because it does not require water quality treatment. Non-PGIS runoff from elevated guideways will be dispersed

over permeable areas where infiltration could occur. This will help to reduce the volume of runoff to be detained, thereby reducing the size of the detention facilities. Dispersion is practical in areas where permeable surfaces exist below the guideway and there is little human activity (because water dripping from the guideway above would be bothersome to people below). Where non-PGIS and PGIS runoff is conveyed jointly, the stormwater management facility will be designed to detain the joint flow and to provide required treatment for the PGIS flow in accordance with Ecology standards.

The following sections describe proposed stormwater treatment for each segment of the corridor.

Segment A: Northgate to Shoreline

Segment A lies within the Thornton Creek and McAleer Creek drainage basins. Most of the segment, from Northgate to NE 180th Street, is within the Thornton Creek basin. The northern end of the segment, from NE 180th Street to the NE 185th Street Station, is within the McAleer Creek basin.

Within the Seattle city limits, management of stormwater from the track in Segment A will be subject to the guidelines of the City of Seattle Flow Control and Water Quality Treatment Technical Requirements Manual, Volume 3. North of Seattle, stormwater from the track will be managed according to the WSDOT 2014 Highway Runoff Manual. The park-and-ride facilities are typically located outside of the WSDOT right-of-way and will require a permit from the City of Shoreline.

The portion of the track south of Northgate Way will drain into the existing stormwater system. Flow control required for new impervious surface will be provided by the Sound Transit Northgate Link Extension.

Proposed flow control facilities for runoff from guideways in Segment A include detention ponds, detention vaults, and infiltration facilities. Overflow from the facilities will drain to existing drainage systems and ultimately to Thornton Creek (except to the northernmost facility, which is within the McAleer Creek basin and which will overflow to the WSDOT trunk line east of I-5). Downstream analyses will be conducted at each flow control facility outfall to evaluate whether the conveyance system has adequate capacity for additional stormwater flows. Some systems may require upgrading.

All surfaces subject to vehicular traffic within park-and-ride facilities are considered PGIS and will require water quality treatment. A water quality facility and detention pond for stormwater runoff from the reconstructed NE 130th Street bridge will be located west of I-5. Stormwater from the NE 145th Street Station will be treated in a bioretention facility and detained in an underground vault that discharges to an enclosed conveyance system leading to Thornton Creek. Stormwater from the NE 185th Street Station, adjacent parking and bus lanes, and the parking garage will be treated in three separate infiltration ponds. Ponds receiving runoff from pollution-generating surfaces will have treatment liners installed in the bottom of the pond to remove pollutants prior to infiltration into the ground.

The optional station at NE 130th Street will have no parking facilities; therefore, there will be no PGIS and water quality treatment will not be required. The runoff from the station will be combined with the track runoff and conveyed to an infiltration facility.

Opportunities for LID are limited in much of Segment A. Till soils underlie the track alignment, limiting infiltration. Much of the track will be in a retained cut, making dispersion infeasible. Additionally, much of the area is highly developed and space is limited adjacent to the track, which also deters the use of dispersion. Nevertheless, guideway dispersion (allowing water to flow off the guideway in a dispersed fashion) may be feasible for some portions of the elevated guideway, provided the vegetation beneath the guideway can be maintained to minimize erosion. Using dispersion would likely eliminate the need for some detention facilities.

Segment B: Shoreline to Mountlake Terrace

Segment B lies entirely within the McAleer drainage basin. The proposed guideway alignment falls within the WSDOT right-of-way; stormwater from the track will therefore be managed according to the WSDOT 2014 Highway Runoff Manual.

The Mountlake Terrace Transit Center and the optional 220th Street SW station are both within the city of Mountlake Terrace. Runoff from these facilities will be subject to the guidelines of the 2012 Ecology Manual. Surfaces to be treated as PGIS include the reconfigured surface parking at Mountlake Terrace Transit Center, the new surface parking at the optional SW 220th Street station, and the reconstructed off-ramps from southbound I-5 at SW 220th Street.

Flow control for runoff from guideways in Segment B will be provided by detention ponds, detention vaults, and infiltration facilities. Overflow from the facilities will drain to existing drainage systems and to McAleer Creek. The portion of the track and station over existing impervious surface at the Mountlake Terrace Transit Center will not require flow control or water quality treatment. Runoff will be directed to the existing detention pond that manages stormwater from the transit center.

Segment C: Mountlake Terrace to Lynnwood

The southern portion of Segment C lies within the McAleer Creek basin and the northern portion is in the Scriber Creek basin. The guideway for Segment C is partially within the WSDOT right-of-way and partially within the city of Lynnwood; stormwater management will follow the WSDOT 2014 Highway Runoff Manual and Ecology's *Stormwater Management Manual for Western Washington*. The City of Lynnwood currently uses the 2005 manual but is expected to adopt the 2012 manual by the time project design is underway.

The soils in Segment C consist of till with young alluvium in the vicinity of Scriber Creek and its associated wetland complex. Infiltration is assumed not to be feasible in this segment. Runoff from the guideway in the southernmost portion of the segment will be directed to the detention vault in the northern portion of Segment B. Flow control for the middle portion of the segment will be provided by a detention vault that will drain to the Scriber Creek wetlands.

The northern end of the alignment passes over the Scriber Creek wetland complex. Runoff from the portion of the guideway directly above the wetlands will be dispersed from the guideway into the wetland. North of the wetland complex, the alignment passes over existing impervious surfaces at the Lynnwood Transit Center. Two existing stormwater vaults in the transit center will be replaced with new vaults that are large enough to accommodate runoff from the new garage and access roads at the redesigned transit center.

2 BEST MANAGEMENT PRACTICES AND MINIMIZATION MEASURES

To avoid and/or minimize potential impacts from construction and operation of the Lynnwood Link Extension, the following conservation measures will be implemented.

2.1 Water Quality Protection During Construction

- A TESC plan will be developed and implemented for all project activities requiring clearing, vegetation removal, grading, ditching, filling, embankment compaction, demolition, and/or excavation. BMPs defined in the TESC plan will be used to control sediments from all vegetation removal or ground-disturbing activities.
- The contractor will implement the TESC plan before discharging or allowing runoff from the site. Monitoring requirements specified in the TESC will provide feedback to ensure that the erosion control practices are operating properly and effectively.
- An SPCC plan will be developed prior to beginning construction. The SPCC plan will identify the appropriate spill containment measures to be employed during construction.
- The contractor will adhere to water quality standards as stated in the 401 Water Quality Certificate and NPDES permit issued for the project.
- Erosion control devices (e.g., silt fences) will be installed, as needed, to protect surface waters and other critical areas.
- Erosion control blankets or an equally effective BMP will be installed on steep slopes that are susceptible to erosion and where ground-disturbing activities have occurred. This will prevent erosion and assist with establishment of native vegetation.
- Material that may be temporarily stored for use in project activities will be covered with plastic or other impervious material during rain events to prevent sediments from being washed from the storage area to surface waters.
- All temporary and permanent erosion and sedimentation control measures will be inspected on a regular basis, maintained, and repaired to ensure continued performance of their intended function.
- Silt fences will be inspected after each rainfall, and at least daily during prolonged rainfall.
- Turbid water (including untreated water from dewatering activities) will be prevented from discharging to streams and wetlands. Turbid wastewater may be routed to temporary or permanent detention facilities, or to upland areas that provide adequate infiltration.
- Any water having direct contact with uncured concrete will be contained and treated or removed from the site (as appropriate) to prevent discharge to streams or wetlands.
- All equipment to be used for construction activities will be cleaned and inspected prior to arriving at the project site to ensure no potentially hazardous materials are exposed, no leaks are present, and the equipment is functioning properly. Should a leak be detected on heavy

equipment used for the project, the equipment will be repaired before use. Wash water will not be discharged directly into any water body without pretreatment.

- Construction equipment and vehicles will be maintained to prevent them from leaking fuel or lubricants.
- Equipment (excluding track-mounted equipment, large cranes, and other relatively immobile equipment) will be refueled and maintenance activities conducted at a distance from the nearest wetlands, ditches, and flowing or standing water approved by regulatory permits.
- Heavy equipment used during the course of in-water work will operate from above the ordinary high water mark of streams wherever possible. Use of equipment below the ordinary high water mark will be limited to that necessary to gain position for work. Drive mechanisms will not enter or operate below the ordinary high water mark, except under the terms of the HPA issued by WDFW.
- If any permanent footings or drilled or pile-driven shafts are installed below the ordinary high water mark, installation will be conducted in a manner consistent with Section 404 and other permits issued for the project by the Corps and other parties (as applicable). When constructing drilled shafts, the contractor will ensure that all drilling equipment, drill recovery and recycling pits, and any waste or spoil produced are properly contained to prevent discharge of drill wastes or fluids to any surface water or wetlands.
- Any materials placed below the ordinary high water mark (e.g., cobble or boulders for energy dissipation at culvert ends, streambed gravel or other substrates) will be relatively clean and will be handled in a way to minimize turbidity. When flow is restored to any such work sites, methods will be employed to minimize turbidity; based on the implementation of these measures, the project is not expected to result in the exceedance of state water quality standards at the point of compliance (as defined in WAC 173-201A) in any affected watercourses.
- Uncured concrete and/or concrete byproducts will be prevented from coming in contact with streams or water conveyed directly to streams during construction in accordance with Washington Administrative Code (WAC) Section 220-110-270(3).
- A concrete truck chute cleanout area or equally effective BMP shall be established to properly contain wet concrete.

2.2 General Best Management Practices for Construction Near All Sensitive Areas

- Sound Transit will ensure compliance with all local, state, and federal permits received for the project.
- Revegetation of construction easements and other areas will occur either during or immediately after the project is completed. All disturbed riparian vegetation will be replanted. Trees will be planted when consistent with light rail safety standards. Riparian areas will be replanted with native species.
- The project will delineate the construction limits for vegetated and habitat areas to prevent unintended effects to riparian vegetation, wetlands, woodlands, and other sensitive sites

outside of the construction limits. The construction limits will be clearly marked with high-visibility construction fencing prior to any ground-disturbing or construction-related activities, and no work in these sensitive areas will occur. There will be no direct site disturbance outside of the construction limits.

- All work will comply with the terms and conditions set forth in the HPA and other permits (such as the Clean Water Act Section 404 permit) issued for the project, including provisions designed to avoid or minimize the potential for adverse effects on habitat in receiving waters. Such provisions could include restrictions on construction periods below the ordinary high-water mark and/or other measures designed to avoid or minimize the potential for construction activities to deliver sediment or pollutants to streams.
- In accordance with typical requirements of an HPA, when large woody debris must be moved to allow the reasonable use of an over-water or in-water facility, the large woody debris will be returned to the water downstream, where it can continue to provide aquatic habitat function.
- Work areas below the ordinary high water mark will be isolated from other surface waters with a coffer dam or similar system to prevent suspended sediment or pollutants from leaving the work area.
- Heavy equipment will operate from above the ordinary high water mark wherever possible.
- Soil or rock stockpiles, excavated materials, and excess soil materials will be prevented from eroding into sensitive habitats, including water channels, wetlands, and riparian areas outside of the construction limits by high water or storm runoff.
- To reduce the risk of adverse effects on migrating salmonids during project construction, Sound Transit will require construction contractors to direct lighting away from fish-bearing waters and to place hoods or shields on lights, as needed, to minimize the amount of backlight or dispersed light cast toward the water's surface.
- If any culverts need to be installed or extended on fish-bearing or potentially fish-bearing streams, design and construction will comply with WAC 220-110-070 regarding fish passage requirements. Any affected streambeds, stream banks adjacent to culverts, and stream relocation reaches will be permanently restored after in-water work with plantings of native or approved woody and herbaceous species within 1 year of completion of each phase of construction.
- Bank protection will follow the guidelines set forth in WDFW's *Integrated Streambank Protection Guidelines*.

2.3 Mitigation for Wetland, Wetland Buffer, and Stream Impacts

- Sound Transit is coordinating with resource agencies on identifying compensatory mitigation sites for wetland and wetland buffer impacts.
- A monitoring plan and adaptive management plan will be implemented for revegetated sensitive areas or buffers. The plans will verify 100 percent survival of all installed native trees and shrubs 1 year after installation. The performance criteria will be met if all dead plants are replaced at the end of the first year. Native woody species (planted and volunteer) will maintain, on average, a density of four plants per 100 square feet in each plant

community by the end of the 3-year period. Plant communities will be identified in the mitigation plan.

2.4 Design and Operation Best Management Practices

- Permanent stormwater runoff treatment and flow control facilities will be installed to meet the requirements of the Sound Transit's 2012 Design Criteria Manual.
- Stormwater conveyance and management facilities that promote infiltration will be incorporated where applicable and permittable.
- Runoff treatment BMPs that are best suited to the site conditions and best capable of achieving the required levels of treatment will be selected, designed, and installed. These may include natural or engineered dispersion BMPs; biofiltration BMPs such as vegetated filter strips, rain gardens, biofiltration swales, or media filters; wet-pool BMPs; and infiltration BMPs.
- Existing drainage configurations will not be rerouted to the extent that stormwater from one basin or subbasins is conveyed and discharged to another unless no other practical option is available.
- Operations will not cause impacts from overwater lighting, because the tracks will have no overhead lighting and the train headlights will point parallel to the tracks.

Examples of design measures on light rail vehicles to prevent pollution resulting from mechanical lubricants include the following:

- Sealed housing roller bearings for all axle bearings
- Enclosed and sealed motor bearings
- Enclosed truck bearings designed to exclude dirt
- Sealed door mechanisms
- Enclosed, sealed electrical conduits
- On-board batteries contained within sealed enclosures
- Air conditioners with refrigerant enclosed in sealed system and motors with sealed bearings

2.5 Weed Control

- Per federal, state, and local requirements and guidance, Sound Transit will implement appropriate measures to minimize risk of introduction and spread of noxious and invasive species.
- The project will implement pesticide application techniques, in accordance with current Ecology water quality agreements, to minimize the impact on aquatic and terrestrial environments.
- To minimize use of herbicides and fertilizers, restoration of disturbed areas will include the use of mulching, ground cover, and other planting strategies that discourage growth of undesirable species.

3 ACTION AREA

The action area is defined as the area with the potential to be affected directly or indirectly by the project actions. Project components with the potential to affect the species addressed in this analysis species include construction activities (which may contribute to increased turbidity and sedimentation in project area water bodies and elevated noise levels in terrestrial and aquatic areas), increases in the amount of impervious surface area (which may affect the quality and quantity of stormwater discharges to project area water bodies), and changes in the condition of riparian habitat. The action area for this project includes all aquatic habitats extending from the upstream extent of the project footprint, downstream to points 100 to 200 feet from the project footprint (varying by water body; see discussion below), the surface-flowing extent of streams within 200 feet of ground-disturbing activities in contiguous vegetated areas, and all terrestrial habitats within a 650- to 3,100-foot radius of the project footprint (Figure 3-1). The following subsections describe the basis for these determinations.

3.1 Terrestrial Considerations

Project components with the potential to affect the terrestrial environment include construction activities that generate noise levels that could potentially disturb sensitive wildlife species. Other sources of potential effects in terrestrial areas include vegetation removal and disturbance, habitat alteration, soil compaction, shading, and potential introduction of invasive species. All of these effects will be contained within the area potentially affected by noise from construction activities; therefore, the area potentially affected by construction noise was used as the basis for defining the terrestrial portion of the action area.

Baseline noise levels along the proposed project alignment are dominated by traffic noise from I-5 and major arterial roadways. Under current conditions, noise levels at locations near all three segments of the proposed project generally range between 60 and 70 decibels on the A-weighted scale (dBA) when averaged over the 1-hour period with peak noise levels (i.e., peak-hour Leq) (Sound Transit 2013).

Construction noise is expected to exceed noise generated from operation of the Lynnwood Link Extension; therefore, construction noise was used as a basis for defining the action area. Construction activities in most portions of all three segments are expected to result in maximum noise levels of approximately 88 dBA (Sound Transit 2013). Sound levels attenuate (i.e., lose intensity and become less audible) with increasing distance from the source of the noise. Buildings, vegetation, and noise walls absorb and deflect noise along all portions of the proposed alignment, resulting in an attenuation rate of 7.5 dBA per doubling of distance. Using that attenuation rate and a conservative estimate of 60 dBA for background noise levels, project-related construction noise will attenuate to the background levels approximately 650 feet from the project footprint.

Action Area

Impact pile driving will likely be required for the construction of temporary work trestles across the Scriber Creek wetland complex near the Lynnwood Transit Center. Impact pile driving can produce maximum short-term noise levels of 99 dBA to 105 dBA at 50 feet (Sound Transit 2013). Using a conservative estimate of 105 dBA, project-related construction noise will attenuate to background levels approximately 3,100 feet from the project footprint.

These two distances—650 feet from most portions of the project footprint and 3,100 feet from locations where impact pile driving may occur—define the geographic extent of project effects relating to noise disturbance. Notably, no ESA-listed species that are sensitive to airborne noise are known or expected to use terrestrial habitats within 5 miles of the project footprint.

3.2 Aquatic Considerations

Project activities in or adjacent to water bodies and wetlands, including earthwork and construction, have the potential to introduce and transport sediment into the aquatic environment at and downstream of the immediate construction or work area. Project activities near water bodies also have the potential to affect riparian habitat, possibly resulting in indirect effects on fish species and habitat.

Sedimentation and turbidity could potentially affect all streams in the project area, with the exception of McAleer Creek tributary SSH2, which is entirely contained in culverts within the action area. The risk of increased sediment input to project area water bodies will be minimized by the use of conservation measures described in Chapter 2. In addition, Sound Transit must comply with water quality mixing zone requirements established by Ecology. For streams with flows of 10 cubic feet per second (cfs) or less during construction the water quality mixing zone is 100 feet downstream of project activities (WAC 173-201A-200-1[e]). For streams with flows between 10 and 100 cfs during construction, the water quality mixing zone is 200 feet.

Construction activities below the ordinary high water mark of water bodies in the action area will comply with the terms and conditions set forth in the HPA and other permits (such as the Clean Water Act Section 404 permit) issued for the project, including provisions designed to avoid or minimize the potential for adverse effects on habitat in receiving waters. Such provisions could include restrictions on construction below the ordinary high-water mark intended to minimize the risk of adverse effects on fish during highly sensitive life history stages (e.g., spawning, rearing). Permits for work in tributaries to Lake Washington commonly require in-water work to be conducted during the summer (likely July and August). During those months, mean daily flows in McAleer Creek are consistently less than 10 cfs (King County 2014a). Flows in Thornton Creek and Scriber Creek are generally less than 10 cfs during July and August, but Snohomish County (2014) and King County (2014a) have reported mean daily flows exceeding 10 cubic feet on a few occasions during those months (less than 5 percent of the July and August dates in the data record for either stream). No monitoring data are available for the tributaries to these streams in the action area, but flows in the tributary streams are substantially lower than flows in the main stem streams; therefore, the potential for any of the tributary streams to support flows exceeding 10 cfs during July or August is negligible. For this analysis, therefore, the mixing zones for Thornton Creek and Scriber

Creek are conservatively estimated to be 200 feet downstream of proposed stream crossings, and the mixing zones for all other potentially affected streams are estimated to be 100 feet downstream of proposed stream crossings. This defines the downstream extent of the aquatic portion of the action area as it relates to potential construction-related increases in turbidity. The only streams where work is proposed below the ordinary high water mark are Scriber Creek and Stream SMT1.

Changes in riparian habitat condition have the potential to affect habitat quality in surface-flowing streams up to 200 feet from the location of ground-disturbing activities. This distance is based on potential effects on riparian functions such as the provision of shade and the recruitment of large woody debris. Stream reaches that are separated from project activities by interruptions in surface flow (e.g., culverts) or vegetative cover (e.g., roadways and maintained clearings wider than 20 feet) are not likely to be affected.

Based on these considerations, the aquatic portion of the action area includes (1) the mixing zones defined above and (2) the surface-flowing extent of streams within 200 feet of ground-disturbing activities in contiguous vegetated areas. This defines the aquatic portion of the action area as it relates to potential construction-related increases in turbidity and potential effects on riparian habitat.

No in-water pile driving will occur in waters that are known or expected to support ESA-listed fish species. In-water pile driving may occur in Scriber Creek, where the stream has an ill-defined channel through the wetland complex west of the Lynnwood Transit Center, upstream of a total barrier to fish passage. Based on the sinuous, braided, and indistinct form of Scriber Creek's channel in the project area, sound energy from any in-water pile driving will not extend more than a few hundred feet upstream or downstream of the location of the activity, and will be blocked by the bends in the stream before it reaches the culvert under I-5 immediately downstream of the location of construction activities. The outlet of that culvert is more than 2,000 feet upstream of any stream reaches that are known or expected to support ESA-listed fish.

4 ENVIRONMENTAL BASELINE

The action area for the Lynnwood Link Extension is dominated by urban development where aquatic habitats have been subjected to moderate to high degrees of alteration. The degree of alteration varies from stream to stream, with the greatest alteration occurring where urban development is the greatest. Some of the smaller streams and headwater reaches have been placed in conveyance systems consisting of pipes and ditches, interfering with natural flow patterns and processes such as groundwater recharge.

The action area for the Lynnwood Link Extension is drained by three stream systems: Thornton Creek, McAleer Creek, and Scriber Creek (Figure 1-1). All three streams drain to Lake Washington. Thornton and McAleer creeks drain directly to the lake, while water from Scriber Creek flows to the lake via Swamp Creek and the Sammamish Slough. Table 4-1 summarizes information about streams in the action area.

Table 4-1. Summary of Streams in the Lynnwood Link Extension Action Area

Stream Name [a]	Stream Index No. [b]	Fish Habitat Status [c]	Local Jurisdiction	Local Jurisdiction Classification [d]	Local Jurisdiction Buffer Width (feet)
Thornton Creek, North Branch	08.0030	Documented	Seattle	Type 3	75
Thornton Creek Tributary (SSE1)	NA	Potential	Seattle	Type 3	75
McAleer Creek Tributary (SSH2)	NA	Unknown (Presumed Potential)	Shoreline	Piped	10
McAleer Creek Tributary (SSH4)	NA	Potential	Shoreline	Type III	65
McAleer Creek	08.0049	Documented	Shoreline	Type II	115
			Mountlake Terrace	Class II	100
McAleer Creek Tributary (SMT1)	08.0050	Potential	Mountlake Terrace	Class III	65
Scriber Creek	08.0061	Documented	Lynnwood	Category I	100
Scriber Creek Tributary (SLY1)	08.0064	Potential	Lynnwood	Category III	35

[a] Streams other than Thornton Creek, McAleer Creek, and Scriber Creek are identified with alphanumeric codes: SYYn. S stands for stream; YY = two-letter code for local jurisdiction (SE = Seattle, SH = Shoreline, MT = Mountlake Terrace, LY = Lynnwood); n = sequential identification number.

[b] Water Resource Inventory Area (WRIA) identification numbers according to Williams et al. (1975). 'NA' indicates watercourses that are not identified in that inventory.

[c] Documented = Fish have been observed in the action area; Potential = Potential fish habitat is present, based on field assessment of stream width and gradient, but stream segments in the action area are upstream of human-caused fish passage barriers; Unknown = No fish presence data are available and stream segments are contained within culverts in the action area.

[d] Identification and classification of streams for this analysis represent conservative estimates, based on available information and the provisions of local critical areas rules. Some of the watercourses identified in this analysis may not actually be defined as streams by the local jurisdictions, or they may be assigned smaller buffers. Actual impacts would be analyzed and mitigated as appropriate through local permitting processes.

Sound Transit identified 37 wetlands in the action area (Table 4-2). All wetlands within 100 feet of the footprint of the proposed alignment were formally delineated and rated according to local regulations and the *Washington State Wetland Rating System for Western Washington* (Hruby 2004). Other wetlands within public rights-of-way near the proposed alignment were mapped and rated as well.

Table 4-2. Summary of Wetlands in the Lynnwood Link Extension Action Area

[a] Wetlands are identified with alphanumeric codes; WYYn, W stands for wetland; PW stands for potential wetland; YY = two-letter code for local jurisdiction (SE = Seattle, SH = Shoreline, MT = Mountlake Terrace, LY = Lynnwood); n = sequential identification number.

[b] Cowardin et al. (1979); USFWS = U.S. Fish and Wildlife Service. PEM = palustrine emergent; PFO = palustrine forested; PSS = palustrine scrub-shrub; PUB = palustrine unconsolidated bottom.

[c] Brinson (1993). HGM = Hydrogeomorphic; Dep = Depressional; Riv = Riverine; Slope = Slope

[d] Seattle Municipal Code 25.09.160.A , only applicable to development on publicly or privately owned parcels; Shoreline Municipal Code 20.80.320, Mountlake Terrace Municipal Code 16.15.080; and Lynnwood Municipal Code 17.10.050

[e] Classification and rating are not yet complete for Wetland WMT11; based on preliminary data, it will likely be rated as Category III or Category IV.

Wetlands outside of public rights-of-way and more than 100 feet from the footprint of the proposed alignment were identified via existing documentation and public vantage points, and are identified as potential wetlands for this analysis. Sound Transit will request jurisdictional determinations of those wetlands that are likely to be affected along the proposed alignment during the permitting phase of this project.

All wetlands in the action area are in areas where the natural environment has been altered by urban development. Many are within maintained rights-of-way where they receive stormwater runoff from pipes, ditches, or overland flow. Other sources of hydrology include a shallow groundwater table, precipitation, and overbank flow from adjacent streams. With one exception, all of the wetlands in the study area have relatively low quality ratings (Category III or IV), indicating moderate to low levels of wetland function and moderate to high levels of disturbance. The exception is a Category II wetland (Wetland WLY4) associated with Scriber Creek. This large wetland/stream complex located near the Lynnwood Transit Center provides multiple water quantity, water quality, and habitat functions. In addition, WLY4 is the only wetland in the action area that is accessible to fish.

The following sections describe the streams and wetlands present in the action area and provide information about fish use[1], fish habitat quality, and riparian habitat conditions in the streams. Anthropogenic factors that influence habitat quality for each stream are also identified. Summary information about wetlands in the action area is also provided. Information is organized by the three project segments, progressing from south to north.

4.1 Segment A: Northgate to Shoreline

Segment A of the Lynnwood Link Extension alignment crosses Thornton Creek and runs parallel to Stream SSE1 (Figure 1-2). Construction and operation of light rail facilities for Segment A also have the potential to affect several wetlands and wetland buffers in the cities of Seattle and Shoreline.

4.1.1 Streams

Thornton Creek

The 7,200-acre Thornton Creek basin drains a substantial portion of northeastern Seattle and most of Shoreline. The stream flows generally south and east before discharging to Lake Washington. Land elevations range from 18 feet at the stream's mouth at Lake Washington to more than 500 feet in the northwestern portions of the basin.

[1] Note that in addition to providing information about known or expected occurrence, WDFW's SalmonScape fish database and mapping application (WDFW 2014b) also identifies stream segments with the potential to support salmonid use, based on stream gradient. Areas with a gradient of 12 percent or greater are considered to be natural barriers to access by most salmonids, including Chinook salmon and steelhead. Stream segments upstream of areas with known species presence but downstream of gradient-based barriers are categorized as 'modeled' habitat for these species. The 'modeled' category does not factor habitat quality, flow, or any other natural or human-caused conditions (including barriers to fish passage) that would otherwise prevent habitat use. For this analysis, a species is presumed to be absent from areas categorized as modeled habitat unless documented observations indicate otherwise.

Thornton Creek drains the southern half of the action area (south of NE 185th Street, approximately). Segments of the North Branch of Thornton Creek (WRIA No. 08.0030) within and immediately upstream of the Jackson Park Golf Course fall within the action area. The South Branch of Thornton Creek, also known as Maple Leaf Creek, originates in wetlands near Northgate, North Seattle Community College, and I-5 (City of Seattle 2007). The two branches join to form the 1.4-mile-long main stream near the Meadowbrook stormwater detention pond in northeast Seattle. The action area does not include any portions of the South Branch or the main stem of Thornton Creek.

The North Branch of Thornton Creek originates near Ronald Bog in Shoreline and flows 5 miles before joining the South Branch, draining an area of approximately 7 square miles (City of Seattle 2007). The only surface-flowing reach of Thornton Creek within the action area is a 100-foot-long segment that flows out of a pair of 1,500-foot-long, 72-inch-diameter culverts under I-5 and into a pair of 48-foot-long, 40-inch-diameter culverts under 5th Avenue NE. After emerging from the culverts under 5th Avenue NE, the stream flows in a ditch between the street and the Jackson Park Golf Course for approximately 700 feet before veering east into the golf course (Tetra Tech/KCM 2004b).

Anthropogenic Factors

Overall, approximately 59 percent of the Thornton Creek basin is covered by impervious surfaces such as roads, buildings, and parking lots (City of Seattle 2007). In portions of the basin north of the Seattle city limits, the City of Shoreline calculated existing impervious area values ranging between 45 and 48 percent (Tetra Tech/KCM 2004b). Kerwin (2001) estimated the effective impervious area in the basin at 31.9 percent. The City of Seattle (2007) identified the following problematic conditions in the system, due primarily to urban development in the basin:

- Altered hydrology, with high and flashy flows
- Degraded water quality, with temperatures and fecal coliform bacteria frequently at levels above state standards
- Excess nutrients under non-storm flow conditions
- Channel incision and degraded in-stream habitat, due to restricted channel width and loss of hydrologic connectivity to the floodplain
- Depressed levels of coarse sediment, in-stream wood, and riparian forest
- Fish passage barriers that limit anadromous fish to 30 percent of the watercourse length
- High pre-spawn mortality rates of coho salmon

Fish Use

The lower reaches of Thornton Creek support spawning anadromous salmonids. Chinook, coho, and sockeye salmon redds have been observed in the North Branch as far upstream as 35th Avenue NE and NE 115th Street, approximately 3 miles downstream of the action area (City of Seattle 2007,

WDFW 2014b). Individual chum salmon (likely strays from other basins [Kerwin 2001]) have also been sighted in the lower portions of the stream (McMillan 2007 in City of Seattle 2007), and steelhead have been observed throughout much of the system (WDFW 2014b).

Chinook salmon have been documented in the North Branch of Thornton Creek as far upstream as the confluence with Littlebrook Creek, approximately 2.5 miles downstream of the action area; the nearest stream reach where Chinook spawning has been documented is in the main stem of Thornton Creek, another 0.5 mile downstream (WDFW 2014b).

According to WDFW (2014b), steelhead are present in the North Branch of Thornton Creek as far upstream as the Jackson Park Golf Course, approximately 1,600 feet downstream of the action area. Based on the observation of an adult steelhead near Twin Ponds upstream of the action area (Tetra Tech/KCM 2004b), however, it is possible that steelhead may use stream habitats in the action area.

Resident salmonids are also present in the Thornton Creek system, including reaches that are within or upstream of the action area. Cutthroat trout (*Oncorhynchus clarki*) have been observed as far upstream as the Jackson Park Golf Course and rainbow trout have been observed another mile upstream, near Twin Ponds (City of Seattle 2007). According to WDFW (2012), resident cutthroat trout are expected to be present in Thornton Creek as far upstream as Ronald Bog. Native non-salmonid species that use Thornton Creek include threespine stickleback (*Gasterosteus aculeatus*), prickly sculpin (*Cottus asper*), coast-range sculpin (*C. aleuticus*), and lamprey (*Lampetra* sp.) (Tabor et al. 2010). Non-native fish species that have been introduced to Thornton Creek, either intentionally or unintentionally, include rock bass (*Ambloplites rupestris*), pumpkinseed (*Lepomis gibbosus*), largemouth bass (*Micropterus salmoides*), and oriental weatherfish (*Misgurnus anguillicaudatus*) (Tabor et al. 2010).

Migratory cutthroat trout are the most abundant salmonid in Thornton Creek, with an average annual adult count of more than 200 live fish on spawning grounds (City of Seattle 2007). Based on carcass counts from 1999 through 2005, the average annual anadromous run size in Thornton Creek is 33 coho, 7 sockeye, and 4 Chinook salmon (City of Seattle 2007).

WDFW (2014a) classified three of the culverts in Thornton Creek downstream of the action area as total barriers to fish passage. An additional 18 structures, including 7 culverts, 5 streambed control structures, 3 recreational dams, 2 bridges, and 1 artificial waterfall, are partial barriers (WDFW 2014a). Within the action area, the culverts under I-5 and 5th Avenue NE are also partial barriers (WDFW 2014a). However, the observation in 2004 of an adult steelhead upstream of Twin Ponds suggests that none of these structures, including the culvert under I-5, may present an absolute barrier to fish passage (Tetra Tech/KCM 2004b). Notably, steelhead are renowned for their ability to negotiate what would be considered barriers for most other salmonids (Tetra Tech/KCM 2004b).

Water Quality

No portions of Thornton Creek within the action area are listed as impaired water bodies under CWA Section 303(d) (Ecology 2012b). The main stem and the lower portions of the North and South Branches are listed as impaired, based on demonstrated exceedances of state water quality standards for temperature and dissolved oxygen (Ecology 2012b). The lowest reaches of the main

stem are also listed for fecal coliform bacteria. In addition, Ecology (2012b) has identified portions of Thornton Creek as a water of concern for both pH and mercury.

Since 1971, King County has monitored water quality in Thornton Creek at a station located near the stream's mouth. Results from a trend analysis of water quality data from 1971 to 2007 indicated that water quality might have declined during that 37-year analysis period, with statistically significant increases in water temperatures, total phosphorus, turbidity, and conductivity, as well as decreased concentrations dissolved oxygen (King County 2014a). Decreased levels of ortho-phosphorus, nitrate-nitrogen, and total nitrogen indicate some improvements in water quality during that period. In its most recent (2013) water quality report for Thornton Creek, King County assigned the stream a water quality index score of 45, indicating a moderate level of concern for water quality (King County 2014c). In general, scores between 40 and 80 indicate a moderate level of concern and scores below 40 indicate a high level of concern. The water quality index score for Thornton Creek was greater than 40 in only 2 of the 14 years from 2000 to 2013 (King County 2014c).

In-stream Habitat

In-stream habitat quality of the North Branch of Thornton Creek within the action area is rated as low, based on channel morphology, sediment regime, and existing physical habitat conditions (City of Seattle 2007). The stream valley in most of the action area has been modified by grading, fill, and excavation, particularly near I-5, where the stream has been straightened and confined. The channel has more sinuosity within the golf course (downstream of the action area), but the banks in many areas are hardened by riprap and the stream cannot migrate. Note that this description is based on surveys that were completed between 1999 and 2004, before stream restoration work was completed within the Jackson Park Golf Course. The habitat benefits of that effort are not reflected in the description (City of Seattle 2007).

Thornton Creek near 5th Avenue NE, looking upstream toward the outlets of the twin culverts under I-5

Throughout the segment of Thornton Creek within the action area, the channel is mostly eroding and degrading or has been locked into place through bank armoring. Gradients range between 1 and 2 percent. Gravel and sand are the dominant sediment types, and riffles and glides are the dominant habitat types; little in-stream structure is present to contribute to pool formation. This dearth of in-stream structure also reduces the channel's capacity to trap and store sediment (City of Seattle 2007). Based on the predominance of fine sediments, spawning habitat quality is considered poor. Based on the presence of overhanging vegetation and relatively deep water, portions of the stream within the action area likely provide suitable rearing habitat for juvenile fish (Tetra Tech/KCM 2004b).

Upstream of the I-5 culvert, Thornton Creek lies outside of the action area and on the opposite side of I-5 from the proposed alignment.

Riparian Habitat

Riparian habitat quality of Thornton Creek within the action area is rated low, based on riparian area width, connectivity, understory and canopy composition, canopy density, and the percentage of the stream shaded by vegetation (City of Seattle 2007). Stream banks in most portions of the action area are dominated by Himalayan blackberry (*Rubus armeniacus*). The riparian buffer within the footprint of the project alignment consists of a 40- to 50-foot-wide strip of trees (primarily red alder [*Alnus rubra*] and young Douglas-fir [*Pseudotsuga menziesii*]) between 5th Avenue NE and the off-ramp from I-5 to NE 130th Street.

On the opposite side of 5th Avenue NE from the project footprint, a 50- to 70-foot-wide strip of vegetation along the stream includes red alder, black cottonwood (*Populus balsamifera*), and scattered patches of immature western redcedar (*Thuja plicata*). This overstory canopy provides shade for the stream during spring and summer (when the deciduous trees have leaves), as well as the potential for contributing some woody debris. Within the golf course, the dominant riparian vegetation along Thornton Creek consists of non-native plants, turf, and landscaping.

Aerial view of riparian habitat along Thornton Creek and SSE1 in the action area

Thornton Creek Tributary SSE1

Approximately 300 feet south of Thornton Creek's crossing under 5th Avenue NE, a watercourse emerges from a culvert in the I-5 right-of-way, flows southward in the ditch on the west side of 5th Avenue NE for approximately 100 feet, and then drains eastward to Thornton Creek via a culvert under 5th Avenue NE. The watercourse was not catalogued as a stream by Williams et al. (1975), the source of the water in the ditch is not known, and historic maps of the area do not indicate the presence of a tributary to Thornton Creek at this location. However, field observations of flowing water during the summer months suggest the possibility that some flow may be derived from groundwater. For this analysis, this watercourse is provisionally identified as a stream (SSE1) and classified as Type 3, based on the presence of a 2-foot-wide channel and a gradient less than 16

percent. A formal determination of whether the watercourse is a stream (and if so, how it is classified) will occur through the process of project permitting with the City of Seattle. Riparian habitat for the surface-flowing segment of the watercourse consists of a strip of red alder and Himalayan blackberry in the I-5 right-of-way between 5th Avenue NE and the off-ramp from I-5 northbound to NE 145th Street.

4.1.2 Wetlands

None of the 13 wetlands identified in Segment A has a surface water connection to any streams that support ESA-listed fish. Collectively, however, the ecological functions of these wetlands (e.g., water quality maintenance, stormwater detention, groundwater recharge) likely contribute to the maintenance of fish habitat conditions in the Thornton Creek basin.

Seven of the wetlands fall within the Seattle city limits and six are within Shoreline (Table 4-2). All seven of the Seattle wetlands are rated as Category III, indicating moderate levels of wetland function. Four of these seven wetlands provide only one habitat class (forested or shrub); the other three provide combinations of two habitat classes (forested, scrub-shrub, or emergent). In Shoreline, four of the wetlands are rated as Category III and two are rated as Category IV (indicating low levels of wetland function). One of the Category III wetlands provides three different habitat classes (forested, scrub-shrub, and emergent), one provides two classes (forested and emergent), and each of other two provides one class (emergent or forested). The two Category IV wetlands provide only one habitat type (emergent). Vegetation in all of the wetlands is a mix of native and non-native species, many of which are disturbance-tolerant. Surrounding buffers range from forested to herbaceous cover; disturbance-tolerant species are common.

4.2 Segment B: Shoreline to Mountlake Terrace

Segment B of the Lynnwood Link Extension alignment crosses three streams: McAleer Creek, Stream SSH2, and Stream SMT1 (see Figures 1-3 and 1-4). Streams SSH2 and SMT1 are non-fish-bearing tributaries to McAleer Creek. Stream SSH2 is entirely contained in culverts through the action area. Construction and operation of light rail facilities for Segment B also have the potential to affect several wetlands and wetland buffers in the cities of Shoreline and Mountlake Terrace.

4.2.1 Streams

McAleer Creek

McAleer Creek (WRIA No. 08.0049) originates at Lake Ballinger and flows roughly 6 miles to the northeast corner of Lake Washington. The 5,300-acre drainage basin includes portions of Lynnwood, Edmonds, Mountlake Terrace, Shoreline, and Lake Forest Park. Land elevations range from 18 feet at the stream's mouth in Lake Washington to more than 500 feet north of the Mountlake Terrace Transit Center. Most of the northern portion of the action area (from NE 185th Street in Shoreline, north to about 208th Street SW in Lynnwood) drains to the McAleer Creek system. Areas north of 224th Street SW drain to Lake Ballinger, which empties to McAleer Creek.

Much of McAleer Creek within the action area is contained within culverts. The stream enters the action area from an open channel through the Nile Golf Course west of I-5. The stream segments in the action area are as follows, progressing from upstream to downstream:

- Culvert under I-5 (440 feet)
- Open channel adjacent to the on-ramp from SR 104 westbound to I-5 northbound (240 feet) (photo at right)
- Culvert under the cloverleaf interchange between I-5 northbound and SR 104 westbound (280 feet)
- Open channel in the area enclosed by the off-ramp from I-5 northbound to SR 104 westbound (200 feet) (photo below, left)
- 4-foot by 6-foot box culvert under SR 104 (320 feet)
- Channelized open water course in the area enclosed by the on-ramp from SR 104 eastbound to I-5 northbound (200 feet) (photo below, right)

Anthropogenic Factors

In addition to the extensive portions of the stream that are contained within culverts, McAleer Creek has been affected by urban development throughout its basin. Kerwin (2001) estimated the

effective impervious area in the basin at 30.5 percent. Tetra Tech/KCM (2004a) calculated the total impervious area for portions of the McAleer Creek basin within the city of Shoreline to be 46 percent. Forested areas provide shade and other vital functions in some areas; in most of the basin, however, riparian habitat includes single-family homes, apartments, and lawns.

Fish Use

McAleer Creek supports anadromous fish as far upstream as Lake Ballinger. The presence of Chinook salmon has been documented approximately 1,000 feet downstream of the action area and spawning has been documented approximately 4,800 feet further downstream (WDFW 2014b). WDFW (2014b) has documented the presence of steelhead as far upstream as the mouth of the tributary (Stream SMT1) near the on-ramp from SR 104 westbound to I-5 northbound, within the action area. Tetra Tech/KCM (2004a) reported observations of steelhead spawning in McAleer Creek approximately 200 feet downstream of the action area, although WDFW (2014b) does not identify any parts of McAleer Creek as spawning habitat for steelhead. King County (2012) reported that volunteers with the Salmon Watcher Program have consistently seen Chinook, coho, and sockeye salmon in the stream but did not specify the upstream extent of observations or whether any spawning activity was observed.

Other salmonids known or expected to be present in the action area are coho salmon and cutthroat trout. Portions of McAleer Creek downstream of the confluence with Stream SMT1 provide spawning habitat for coho salmon, while those upstream of that point provide rearing habitat (WDFW 2014b). Resident cutthroat trout are present throughout the stream, even upstream of Lake Ballinger (WDFW 2012), and have been observed spawning in McAleer Creek immediately outside of the action area (Tetra Tech/KCM 2004a). The lower reaches of the stream provide spawning habitat for sockeye salmon (WDFW 2014b). Kokanee salmon and rainbow trout have also been observed in McAleer Creek, but locations for those observations have not been specified (Kerwin 2001).

WDFW (2014a) classified four culverts in McAleer Creek downstream of the project action as partial barriers to fish passage and one culvert as a possible barrier. Within the action area, the culverts under I-5 and under the off-ramp from I-5 northbound to SR 104 westbound are also partial barriers (WDFW 2014a). The culvert under I-5 may be a migration barrier to juvenile salmonids that prevents the use of Lake Ballinger for rearing (Kerwin 2001).

Water Quality

No portions of McAleer Creek within the action area are listed as impaired or waters of concern under the Clean Water Act (CWA) Section 303(d). The lower portions of McAleer Creek are listed as impaired water bodies, based on demonstrated exceedances of state water quality standards for fecal coliform and dissolved oxygen (Ecology 2012b). Lake Ballinger upstream of the action area is on the list for contaminants, including polychlorinated biphenyls (PCBs), dieldrin, and 2,3,7,8-TCDD, which have been detected in fish tissue samples (Ecology 2012b).

Sediment samples collected at a site approximately 1 mile upstream of the action area had chemical compounds at concentrations likely to cause adverse effects in aquatic animals living in the sediments (King County 2012). Sediment samples from a site approximately 0.25 mile downstream of the action area contained pyrene and nickel, but the potential for chemical effects is uncertain due to the contaminant levels (King County 2012).

Since 1976, King County has monitored water quality in McAleer Creek at a station located near the stream's mouth. Results from a trend analysis of water quality data from 1979 to 2004 did not indicate any significant changes in temperature; concentration of dissolved oxygen; or levels of bacteria, nitrogen, and total phosphorus (King County 2012). However, conductivity increased significantly during the analysis period, suggesting the presence of dissolved charged substances in the water, possibly related to metal concentrations in sediments (King County 2012). Decreasing levels of total suspended solids and decreased concentrations of ortho-phosphorus indicate some improvements in water quality during that 25-year period. In its most recent water quality report for McAleer Creek, King County assigned the stream a water quality index score of 74, indicating a moderate level of concern for water quality (King County 2014b). In general, scores between 40 and 80 indicate a moderate level of concern and scores above 80 indicate a low level of concern. Water quality index scores for McAleer Creek generally ranged between 50 and 60 from 2000 to 2008, dropping below 40 in two years (King County 2014b).

In-stream Habitat

Immediately downstream of the action area, the in-stream habitat of McAleer Creek has been rated as poor, based on the preponderance of fine sediments, as well as scouring and incision resulting from bank hardening (Tetra Tech/KCM 2004a). The channel provides poorly defined pool-riffle complexes; the only pool habitat consists of step-pools formed by weirs. The gravel/cobble stream substrate is heavily cemented with sediment, which reduces its spawning suitability (Tetra Tech/KCM 2004a). Based on benthic invertebrate samples collected in 2002 and 2003, King County (2012) rated conditions in McAleer Creek as poor for benthic invertebrates.

Riparian Habitat

Riparian habitat quality along the open-channel segments of McAleer Creek in the action area is generally good and is dominated by forest canopy that provides shade and the potential for recruitment of woody debris that contributes to channel complexity. The value of the riparian habitat is limited, however, by a lack of connectivity. The open-channel habitat and associated riparian areas of McAleer Creek occur in three discrete segments in the action area, separated by segments that are contained within culverts.

McAleer Creek Tributary SSH2

Approximately 1,800 feet south of the I-5/SR 104 interchange, a tributary to McAleer Creek (Stream SSH2) has been identified as passing under I-5 (Tetra Tech/KCM 2004a). This tributary was not

catalogued by Williams et al. (1975). The stream enters a culvert just west of I-5, is contained within culverts through the action area, and resurfaces approximately 1,500 feet later, shortly before its confluence with the main stem near a wastewater pumping station upstream of 15th Avenue NE (Tetra Tech/KCM 2004a). The open-water portions of the stream west of I-5 are within concrete-lined ditches along NE 200th Street. During site visits conducted for this analysis, flowing water was observed in this watercourse only during and immediately after rainfall.

Stream SSH2 in ditch along NE 200th Street, immediately upstream (west) of I-5

Based on the presence of human-created barriers to fish passage, no fish are known or expected to use Stream SSH2 in the action area (WDFW 2014b, 2012). In addition, all portions of the stream within and adjacent to the footprint of the Lynnwood Link Extension are contained within culverts. However, the basin size, channel width, and stream gradient of the tributary indicate the potential to support fish use in the future.

McAleer Creek Tributary SSH4

Within the cloverleaf interchange between eastbound SR 104 and northbound I-5, a watercourse emerges from a culvert under the roadway, flows approximately 30 feet, and then joins McAleer Creek. The watercourse was not catalogued as a stream by Williams et al. (1975), the source of the water is not known, and historic maps of the area do not indicate the presence of a tributary to McAleer Creek at this location. However, field observations of flowing water during the summer months suggest the possibility that some flow may be derived from groundwater. For this analysis, this watercourse is provisionally identified as a stream (SSH4) and classified as Type III, based on the presence of a 2-foot-wide channel and a gradient less than 16 percent. A formal determination of whether the watercourse is a stream (and if so, how it is classified) will occur through the process of project permitting with the City of Shoreline. If the watercourse is classified as a Type III stream, its regulatory buffer will be contained entirely within the larger regulatory buffer for McAleer Creek. Riparian habitat conditions for Stream SSH4 are therefore as described for McAleer Creek, above.

McAleer Creek Tributary SMT1

North of the I-5/SR 104 interchange, a tributary (WRIA No. 08.0050; Stream SMT1) joins McAleer Creek in the wooded area adjacent to the on-ramp from SR 104 westbound to I-5 northbound. The tributary originates in Veterans Memorial Park northeast of the Mountlake Terrace Transit Center, then flows south through a series of open watercourses and culverts east of I-5. During site visits conducted for this analysis, flowing water was observed in this watercourse only during and immediately after rainfall. Farther downstream, along the eastern border of the Edmonds School

District property south of 236th Street SW, water from a culvert under the school property contributes flow on a more regular basis. The City of Mountlake Terrace has identified the uppermost reaches of this watercourse in the study area as a Class V (seasonal, non-fish-bearing) stream. City staff have not yet made a determination concerning the classification of the downstream reaches that have more consistent flow. The segment that is crossed by the proposed light rail alignments is upstream of the water source in the Edmonds School District property and is likely to be considered a Class V stream.

WDFW (2014a) identified the culvert at the mouth of Stream SMT1 as a total barrier to fish passage. Based on the presence of human-created barriers to fish passage, no fish are known or expected to use Stream SMT1 in the action area (WDFW 2014b, 2012). However, the basin size, channel width, and stream gradient of the tributary indicate the potential to support fish use in the future. Riparian habitat quality along the open-channel segments of Stream SMT1 in the action area is generally good and dominated by forest canopy that provides shade and the potential for recruitment of woody debris that contributes to channel complexity. The stream reach that falls within the footprint of the elevated guideway is contained within an ill-defined channel that shows minimal traces of surface flow.

Ill-defined channel of Stream SMT1 south of the off-ramp from I-5 to South 236th Street

Culvert at confluence of Stream SMT1 with McAleer Creek

4.2.2 Wetlands

None of the 14 wetlands identified in Segment B has a surface water connection to any streams that support ESA-listed fish. Collectively, however, the ecological functions of these wetlands (e.g., water quality maintenance, stormwater detention, groundwater recharge) likely contribute to the maintenance of fish habitat conditions in the McAleer Creek basin.

Two of the wetlands fall within the Shoreline city limits and twelve are within Mountlake Terrace (Table 4-2). Both of the Shoreline wetlands are rated as Category III, indicating moderate levels of wetland function. One has two habitat classes (forested and emergent) and the other has one (forested). In Mountlake Terrace, eight of the wetlands are rated as Category III and three are rated as Category IV (indicating low levels of wetland function). Classification and rating are not yet complete for one of the Mountlake Terrace wetlands; based on preliminary data, it will likely be rated as Category III or Category IV. Two of the Category III wetlands in Mountlake Terrace provide two different habitat classes (combinations of forested and scrub-shrub or emergent). The other six Category III wetlands in Mountlake Terrace provide only one habitat class: five are forested and one is scrub-shrub. The three Category IV wetlands in Mountlake Terrace provide only one habitat class (forested or emergent). Vegetation in all of the wetlands is a mix of native and non-native species, many of which are disturbance-tolerant. Surrounding buffers range from forested to herbaceous cover; disturbance-tolerant species are common.

4.3 Segment C: Mountlake Terrace to Lynnwood

Segment C of the proposed Lynnwood Link Extension alignment crosses Scriber Creek within a wetland complex immediately west of the Lynnwood Transit Center (Figure 1-4). Also, a tributary to Scriber Creek (Stream SLY1) west of the transit center may benefit from improvements in flow control and water quality treatment. Construction and operation of light rail facilities for Segment C also have the potential to affect several wetlands and wetland buffers in Lynnwood.

4.3.1 Streams

Scriber Creek

Scriber Creek (WRIA No. 08.0061) drains approximately 4,250 acres, including the extreme northern portion of the action area. Land elevations range from approximately 200 feet at the stream's confluence with Swamp Creek to more than 600 feet at the northwest watershed divide. The stream flows southeast, joining Swamp Creek approximately 2.6 miles downstream of the action area. Swamp Creek flows into the Sammamish River, which empties into the northern end of Lake Washington.

Scriber Creek within the wetland complex, looking downstream

For much of its length in the action area, the stream channel is braided and indistinct as it flows through the large wetland complex (Wetland WLY4) south and west of the Lynnwood Transit Center. The stream forms a defined channel as it exits the action area, flowing southeast and under I-5. Based on input provided by Ecology staff who collaborated on field delineations in July 2014, the ordinary high water mark of Scriber Creek through the wetland

complex is defined as encompassing the entire breadth of the complex. At most times of year, flowing water is confined to a few channels that make up a small portion of total wetland complex area. The locations of these channels likely change from year to year.

Anthropogenic Factors

Scriber Creek subbasin is the most highly developed of the Swamp Creek subbasins. Commercial development and transportation corridors account for approximately 40 percent of the subbasin, and medium-density, single-family development covers another approximately 30 percent (Snohomish County 2002). The effective impervious area in the subbasin is approximately 40 percent (Snohomish County 2002). Jones and Stokes (2000) identified untreated runoff from roads and new construction as a likely source of excessive fine sediment in the portion of Scriber Creek that falls within the action area. Street runoff from roads upstream of the action area also conveys oil and other pollutants to the stream system.

Fish Use

Anadromous salmonids have been observed in Scriber Creek, but sources differ about their habitat use as far upstream as the action area. WDFW (2014a) identified a total barrier to anadromous fish passage in a wooded area near 209th Place SW, approximately 2,900 feet downstream of the action area. According to WDFW (2014b), however, the upstream extent of anadromous salmonid presence in Scriber Creek is approximately 500 feet downstream of the action area, where coho salmon have been observed below the culvert under I-5. The picture is further complicated by reports from the City of Lynnwood (2004) of adult coho salmon in Scriber Creek as far upstream as Highway 99, approximately 1 mile above the action area.

Chinook salmon have been documented in Scriber Creek just upstream of Larch Way, approximately 3,100 feet downstream of the action area; the nearest stream reaches that provide spawning habitat for Chinook salmon are in Swamp Creek, approximately 2.6 miles downstream (WDFW 2014b). Steelhead are not currently known or expected to use habitats in Scriber Creek, although winter-run steelhead have been observed in Swamp Creek, to which Scriber Creek is a tributary (Snohomish County 2002, WDFW 2014b). There are no recent validated reports of bull trout in any of the subbasins of Swamp Creek (Snohomish County 2002, WDFW 2014b).

Along with the coho salmon noted above, the other salmonid species that has been documented in Scriber Creek is resident cutthroat trout, which is present throughout the action area and as far upstream as Scriber Lake Park (WDFW 2012). Other species in the stream include largemouth bass and yellow perch, which have been observed in Scriber Lake upstream of the action area (Jones and Stokes 2000).

WDFW (2014a) classified the culvert under I-5 immediately downstream of the action area as a partial barrier to fish passage, and identified a total barrier another 2,100 feet downstream (i.e., 2,900 feet downstream of the action area). As noted above, however, the classification of the latter site as a total barrier is not consistent with reported sightings of adult coho salmon as far as 1 mile upstream of the action area. Based on the lack of reported observations of other salmonid species in the

action area, combined with the presence of multiple barriers to fish passage downstream, it is assumed for this analysis that the information from WDFW (2014b) accurately reflects fish use, and that the only salmonids potentially present in Scriber Creek in the action area are coho salmon and cutthroat trout.

Water Quality

Scriber Creek is not on the 303(d) list of impaired waters in the State of Washington. Possible water quality problems may be indicated, however, by evidence of hydrocarbon pollution (oily sheen and odor) and the abundance of pollutant-tolerant stream invertebrates (Jones and Stokes 2000). Stream temperatures measured in the action area fall within the acceptable range for salmonid fish use, but the lack of shade-producing vegetation increases the risk of elevated temperatures (Jones and Stokes 2000).

In-stream Habitat

The main stem reach in the action area is dominated by the large scrub/shrub wetland adjacent to the Lynnwood Transit Center. Salmon spawning habitat conditions within this reach are poor due to limited canopy and vegetative cover, the presence of bank armoring, and the abundance of silt and other fine substrates (Jones and Stokes 2000). Side channels and other low-velocity areas may provide good rearing habitat, however (City of Lynnwood 2004).

Riparian Habitat

Riparian vegetation in the action area consists of a dense growth of salmonberry (*Rubus spectabilis*) and Himalayan blackberry, with a few red alder, western redcedar, bigleaf maple (*Acer macrophyllum*), and Pacific flowering dogwood (*Cornus nuttallii*). Jones and Stokes (2000) found little to no large woody debris in the stream and determined that the potential for large woody debris recruitment is low.

Scriber Creek riparian area, looking west from the Interurban Trail

Scriber Creek Tributary SLY1

Stream SLY1 near the culvert under the I-5 on-ramp, looking upstream

Stream SLY1 (WRIA No. 08.0064) is an unnamed, intermittent tributary that flows southward along the eastern edge of the Lynnwood Transit Center. The channel within the action area passes through a small patch of forest vegetation (the upper part has been recently planted) before the stream enters a culvert under the I-5 on-ramp and joins Scriber Creek southeast of I-5.

Stream SLY1 is not known or expected to support fish (Snohomish County 2002, WDFW 2014b). Channel morphology and hydrology have been altered by urban development throughout the stream basin (City of Lynnwood 2004). The stream channel in the action area is a channelized, straight ditch. The primary source of flow in the stream is urban runoff. Habitat quality, particularly in the lower reaches in the action area, is generally poor. Stormwater runoff from impervious surfaces likely contributes to a flashy flow regime during the fall and winter months (City of Lynnwood 2004). Almost the entire length of Stream SLY1 is enclosed within culverts. The exceptions are the short segments within and downstream of the action area, and a segment on the Lynnwood Civic Center campus approximately 0.6 mile north of the action area.

The portion of Stream SLY1 in the action area is separated from known fish-bearing waters by culverts under the off-ramp from I-5 northbound to 44th Avenue West, I-5 itself, and the on-ramp from 44th Avenue West to I-5 southbound. WDFW (2014a) has not evaluated the fish passage potential of these culverts because Stream SLY1 is considered a non-fish-bearing stream. Based on its basin size, channel width, and stream gradient, the stream may have the potential to support fish use in the future.

4.3.2 Wetlands

One of the ten wetlands in Segment C has a surface water connection to a fish-bearing stream. This is Wetland WLY4, the Scriber Creek wetland complex. However, based on the presence of a total barrier to fish passage about 2,900 feet downstream of the action area, no ESA-listed fish are expected to use habitats in the Scriber Creek wetland complex. None of the other nine wetlands identified in Segment C has a surface water connection to any streams that support ESA-listed fish. Collectively, however, the ecological functions of these wetlands (e.g., water quality maintenance, stormwater detention, groundwater recharge) likely contribute to the maintenance of fish habitat conditions in the Scriber Creek basin.

All 10 wetlands fall within the Lynnwood city limits (Table 4-2), and all but the Scriber Creek wetland complex (discussed below) are rated as Category III, indicating moderate levels of wetland

function. Each of the Category III wetlands has only one habitat class: three are forested, three are shrub-scrub, two are emergent, and one is unconsolidated bottom. Vegetation in the Category III wetlands is a mix of native and non-native species, many of which are disturbance-tolerant. Surrounding buffers range from forested to herbaceous cover; disturbance-tolerant species are common.

Wetland WLY4 is a large wetland/stream complex associated with Scriber Creek, located southwest of the Lynnwood Transit Center and northeast of 204th Street SW (see Figure 1-4). The wetland is classified as palustrine forested/palustrine scrub-shrub/palustrine emergent under the USFWS system, and riverine/depressional under the hydrogeomorphic system. Wetland WLY4 is rated as Category II according to the City of Lynnwood and Ecology.

The hydrology of Wetland WLY4 is supported primarily by Scriber Creek, which enters the wetland from the north. A high groundwater table and stormwater runoff likely contribute to the hydrology as well. Saturation of soils, inundation, a permanently flowing stream, and open water ponds were observed in areas of the wetland. The channel of Scriber Creek is well-defined near the northern and southern boundaries, becoming distinct in between. The wetland and Scriber Creek drain southeast, out of the study area.

Wetland WLY4 contains forested, scrub-shrub, and emergent communities. The forested areas are dominated by black cottonwood, Pacific willow (*Salix lucida*), and reed canarygrass (*Phalaris arundinacea*), with lesser amounts of western redcedar, Sitka spruce (*Picea sitchensis*), and salmonberry. The shrub community consists primarily of rose spirea (*Spiraea douglasii*), red-osier dogwood (*Cornus sericea*), twinberry honeysuckle (*Lonicera involucrata*), and Sitka willow (*Salix sitchensis*). Indian plum (*Oemleria cerasiformis)*, western skunk cabbage (*Lysichiton americanus*), and water parsley (*Oenanthe sarmentosa*) are also present. Reed canarygrass dominates the emergent community. The southern portion of the wetland adjacent to the Interurban Trail is actively maintained.

Soil was examined to a depth of 20 inches and consists of one layer. The soil is a black (10YR 2/1) mucky silt. High levels of organic content in various stages of decomposition were observed in the soil.

The wetland is in an urban setting and much of the buffer is a narrow line of trees located between the wetland and developed areas, such as parking lots, trails, or residential and commercial structures. Buffer vegetation includes Douglas-fir, western redcedar, red alder, black cottonwood, Himalayan blackberry, red-osier dogwood, English holly (*Ilex aquifolium*), Portugal laurel (*Prunus lusitanica*), western swordfern (*Polystichum munitum*), English ivy (*Hedera helix*), maintained grasses, and other disturbance-tolerant species. Plantings, a split rail fence, and Native Growth Protection Area signs were observed in the vicinity of the private property to the south along the wetland edge.

4.4 Mitigation Site(s)

Sound Transit is working with resource and regulatory agencies to develop a mitigation plan to offset the impacts of construction and operational effects on wetland and riparian habitat and buffers. Impacts to wetlands and wetland buffers will be mitigated through the use of available

approved mitigation banks, the King County in-lieu fee program, or project-specific wetland mitigation developed by Sound Transit. Compensatory mitigation will be implemented in accordance with applicable federal, state, and local requirements and guidelines. Mitigation for unavoidable impacts on riparian habitat will also be provided in accordance with the requirements of local critical areas ordinances. Current potential sites under consideration for project-specific mitigation are described below.

North Seattle Community College Campus

Various opportunities may be present on the North Seattle Community College Campus for wetland restoration and enhancement, although other projects proposed in the vicinity may reduce the area available.

Jackson Park Golf Course/5th Avenue NE

Potential wetland and riparian mitigation could be constructed along the east side of the 5th Avenue NE right-of-way and the Jackson Park Golf Course, particularly along North Branch Thornton Creek.

NE 145th Street Vicinity

Two potentially available parcels near Paramount Park in Shoreline may provide opportunities for wetland protection and restoration.

NE 155th Street Vicinity

Wetland creation may be possible south NE 155th Street near the locations of two wetlands identified near the I-5 right-of-way.

Ballinger Lake Golf Course

The City of Mountlake Terrace will be transitioning the Ballinger Lake Golf Course to a passive park/open space, which could create wetland restoration opportunities.

Scriber Creek Wetland Complex (Wetland WLY4)

Wetland and stream mitigation opportunities are present in the Scriber Creek vicinity near the Lynnwood Transit Center. These parcels are under both public and private ownership, including parcels that could be acquired by Sound Transit because they intersect with areas needed for the light rail right-of-way. A private parcel on Cedar Valley Road, along the western edge of the wetland complex, could also provide an opportunity for mitigation. These mitigation opportunities may include wetland creation, restoration, or enhancement.

5 SPECIES AND CRITICAL HABITAT STATUS AND OCCURRENCE

Species covered in this BA are Chinook salmon, steelhead, and bull trout. Although none of these species has a high likelihood of occurrence in any of the stream reaches that are crossed by the proposed Lynnwood Link Extension alignment, all three are known to use habitats in downstream reaches that receive stormwater runoff from the project area. In addition, it is possible that Chinook salmon and steelhead may venture into Thornton Creek and McAleer Creek in the action area. Table 5-1 identifies the ESA-listed species that are known or expected to be present in the stream reaches with the potential to be affected by project activities. No designated or proposed critical habitat for any species occurs in the action area.

Table 5-1. Presence of ESA-listed Species at Sites with Potential Impacts on Fish

Stream	ESA-Listed Species Potentially Affected	Comments
Project Segment A		
Thornton Creek, North Branch	Steelhead	Access to action area impeded by several total and partial barriers to fish passage downstream; however, a single adult steelhead was observed upstream of the action area in 2004.
Thornton Creek Tributary (SSE1)	None	Small, intermittent stream with no known or expected fish use; high levels of urban development likely contribute to flashy flow regime.
Project Segment B		
McAleer Creek Tributary (SSH2)	None	Entirely contained within pipes in action area; no known or expected use by fish.
McAleer Creek	Chinook Steelhead	Downstream barriers to access likely impede but do not necessarily preclude access to action area.
McAleer Creek Tributary (SMT1)	None	Small, intermittent stream with no known or expected fish use; high levels of urban development likely contribute to flashy flow regime.
Project Segment C		
Scriber Creek	None	Total barrier to fish passage approximately 2,900 feet downstream of action area.
Scriber Creek Tributary (SLY1)	None	Small, intermittent stream with no known or expected fish use; high levels of urban development likely contribute to flashy flow regime.

Species lists from the USFWS and the NMFS were obtained from the agencies' Web sites in March 2014. The lists are provided in Appendix C. In addition to the three species listed above, the USFWS species lists for King and Snohomish counties identify five ESA-listed wildlife species (Canada lynx, gray wolf, grizzly bear, marbled murrelet, and northern spotted owl), two species that are proposed for listing (North American wolverine and Oregon spotted frog), and two candidates for listing (Pacific fisher and yellow-billed cuckoo) that may occur in the two counties (USFWS 2014). None of these species is expected to occur in the action area, however, for the following reasons:

- Canada lynx, gray wolf, grizzly bear, and North American wolverine – The action area is in a lowland setting with relatively high levels of human activity and no nearby roadless areas and does not, therefore, provide suitable habitat for any of these species. No observations of any of these species have been documented within 5 miles of the action area (WDFW 2012).
- Marbled murrelet and northern spotted owl – Both of these species require old-growth forest for breeding, and marbled murrelets require marine habitat for foraging. No breeding or foraging habitat for either species is present in the action area, and no observations of either species have been documented within 5 miles (WDFW 2012).
- Oregon spotted frog – This species is known to occur in Washington only at large wetland complexes in Klickitat, Skamania, and Thurston counties. Oregon spotted frogs depend on perennial bodies of water and associated wetlands. No such habitat is present in the action area. The nearest location where Oregon spotted frog critical habitat has been proposed for designation is more than 50 miles from the action area.
- Pacific fisher – This species requires forests with diverse successional stages containing a high proportion of mid- and late-successional characteristics. No such habitat is present in or near the action area, and no observations of this species have been documented within 5 miles (WDFW 2012).
- Yellow-billed cuckoo – This species requires large blocks of riparian habitat for breeding. No such habitat is present in or near the action area. WDFW (2012) reports a single observation of a bird matching the description of a yellow-billed cuckoo flying across an on-ramp to I-5 in 2000. Based on the lack of suitable nesting habitat and the absence of any other documented sightings within 5 miles, yellow-billed cuckoos are not expected to breed or forage in the action area.

In addition, the action area contains no designated or proposed critical habitat for any of these species (USFWS 2014). Based on the above, the Lynnwood Link Extension has no potential to affect any of these species, and they will not be addressed further in this analysis.

Information from the Washington Department of Natural Resources (DNR) Natural Heritage database indicates that no threatened or endangered plants are known to occur within 5 miles of the project area (DNR 2014). The only ESA-listed plant with the potential to occur in King County is golden paintbrush (*Castilleja levisecta*), which is known from historical observations in the region. Suitable habitat for golden paintbrush (open grasslands in glacial outwash prairies) is not present at any locations where project–related actions will occur. For these reasons, the proposed project has no potential to affect this species.

5.1 Chinook Salmon

Puget Sound Chinook salmon were listed as threatened by NMFS on August 2, 1999 (64 Federal Register [FR] 41835). The Puget Sound evolutionarily significant unit (ESU) includes all naturally spawned Chinook salmon spawned in tributaries to the Puget Sound. The ESU also includes Chinook salmon from 26 artificial propagation programs, including the Issaquah Creek hatchery program in the Lake Washington system (79 FR 20802, April 14, 2014). Fish that use stream habitats in the Lake Washington system belong to the Sammamish population. The most recent 5-year (2005

to 2009) estimate of spawning abundance for the Sammamish population was 249 fish, making up less than 1 percent of the total number of spawning fish in the ESU (Ford 2011).

Chinook salmon have been documented in the lower reaches of Thornton, McAleer, and Scriber creeks. In all three streams, the reaches where Chinook salmon have been observed are separated from the action area by total or partial fish passage barriers. It is possible, however, that Chinook salmon may use habitat in McAleer Creek within the action area. None of the tributaries to Thornton, McAleer, and Scriber creeks in the action area are known or expected to support fish use. The known distribution of Puget Sound Chinook salmon in the vicinity of the action area is as follows:

- **Thornton Creek:** Chinook salmon presence has been documented approximately 2.5 miles downstream of the action area; spawning has been documented approximately 3 miles downstream of the action area (City of Seattle 2007, WDFW 2014b). WDFW (2014a) identified 3 total barriers and 15 partial barriers to fish passage between the action area and the downstream reaches where Chinook salmon presence has been documented. Based on the lack of observations and the presence of multiple total and partial barriers to fish passage downstream of the action area, Chinook salmon are not expected to use habitats in Thornton Creek or its tributaries in the action area.
- **McAleer Creek:** Chinook salmon presence has been documented approximately 1,000 feet downstream of the action area; spawning has been documented approximately 1.1 miles downstream of the action area (WDFW 2014b). WDFW (2014a) has identified a partial barrier to fish passage immediately downstream of the action area, where the stream passes through an approximately 60-foot-long culvert under Forest Park Drive NE. Although this structure likely impedes access into the action area by Chinook salmon, it cannot be considered an absolute barrier. Therefore, Chinook salmon may use habitat in McAleer Creek in the action area. Both of the tributaries to McAleer Creek in the action area (SSH2, SMT1) are separated from fish-bearing waters by total barriers to fish passage and are therefore not expected to support use by Chinook salmon.
- **Scriber Creek:** Chinook salmon presence has been documented approximately 3,100 feet downstream of the action area. No spawning has been documented in Scriber Creek, but spawning has been documented in Swamp Creek, approximately 2.6 miles downstream of the action area (WDFW 2014b). WDFW (2014a) has identified a partial barrier to fish passage in Scriber Creek immediately downstream of the action area, where the stream passes through a 360-foot-long culvert under I-5. In addition, there is a total fish passage barrier at a beaver pond approximately 2,900 feet downstream of the action area (WDFW 2014a). Based on the lack of observations and the presence of total and partial barriers to fish passage downstream of the action area, Chinook salmon are not expected to use habitats in Scriber Creek or its tributaries in the action area.

Adult Chinook salmon enter the Lake Washington system from Puget Sound through the Ballard Locks in July through September (Celedonia et al. 2011). Adult Chinook salmon begin entering the spawning streams in September and continue until November. Spawning occurs from October to December, with peak spawning activity usually in the first few weeks of October (Burton et al. 2009). Fry emerge from redds between January and early April (Kiyohara and Zimmerman 2009). Juvenile Chinook salmon in the Lake Washington system appear to have two rearing strategies:

some rear in their natal streams and emigrate to the lake as pre-smolts in May, June, or July; others emigrate as fry between January and mid-May and rear in the south or north end of Lake Washington or in Lake Sammamish for several months (Celedonia et al. 2011). All Lake Washington Chinook migrate to marine habitats during their first year.

Based on the above, Chinook salmon may be present in the action area from September through December. During these months, adult salmon spawning in downstream reaches of McAleer Creek may venture upstream into the action area. No other stream reaches in the action area are accessible to Chinook salmon. Juvenile Chinook salmon are not expected to be present in any streams in the action area at any time because no spawning is known or expected to occur in stream reaches within or upstream of the action area.

5.2 Chinook Salmon Critical Habitat

The final rule designating critical habitat for Puget Sound Chinook salmon (70 FR 52630, September 2, 2005) included habitat areas in Lake Washington and the Cedar River but excluded other tributaries to Lake Washington. Thus, the water bodies in the action area are not designated as critical habitat for Puget Sound Chinook salmon.

5.3 Steelhead

The Puget Sound steelhead distinct population segment (DPS) is listed as a threatened species (72 FR 26722, May 11, 2007). The DPS includes all naturally spawned anadromous *Oncorhynchus mykiss* originating below natural and manmade impassable barriers from rivers flowing into Puget Sound (79 FR 20802, April 14, 2014). The DPS also includes steelhead from six artificial propagation programs, none of which operate in the Lake Washington system. Fish that use stream habitats in the Lake Washington system belong to the Lake Washington population. The number of naturally spawned steelhead in this population is very low. The most recent 5-year (2005 to 2009) estimate of spawning abundance for the Lake Washington population was 12 fish (Ford 2011).

Steelhead have been documented in Thornton Creek and McAleer Creek in the action area. Steelhead are not currently known or expected to use habitats in Scriber Creek. None of the tributaries to Thornton, McAleer, and Scriber creeks in the action area are known or expected to support fish use. The known distribution of Puget Sound steelhead in the vicinity of the action area is as follows:

- **Thornton Creek:** According to WDFW (2014b), steelhead are present in the North Branch of Thornton Creek as far upstream as the Jackson Park Golf Course, approximately 2,100 feet downstream of the action area. Based on the observation of an adult steelhead near Twin Ponds upstream of the action area (Tetra Tech/KCM 2004b), however, it is possible that steelhead might use stream habitats in the action area. The tributary to Thornton Creek in the action area (Stream SSE1) is neither known nor expected to support fish use (WDFW 2014b, 2012).
- **McAleer Creek:** According WDFW (2014b), steelhead are present in McAleer Creek as far upstream as the mouth of the tributary (Stream SMT1) near the on-ramp from SR 104

westbound to I-5 northbound, within the action area. Tetra Tech/KCM (2004a) reported observations of steelhead spawning in McAleer Creek approximately 200 feet downstream of the action area, although WDFW (2014b) does not identify any parts of McAleer Creek as spawning habitat for steelhead. The site where Tetra Tech/KCM (2004a) reported observations of steelhead spawning is separated from the action area by a culvert under Forest Park Drive NE that has been identified by WDFW (2014a) as a partial barrier to fish passage. Based on this information, steelhead may use stream habitats in McAleer Creek in the action area, but they are not expected to spawn there. Both of the tributaries to McAleer Creek in the action area (SSH2, SMT1) are separated from fish-bearing waters by total barriers to fish passage and are therefore not expected to support use by steelhead.

- **Scriber Creek:** Steelhead are not currently known or expected to use habitats in Scriber Creek, although winter-run steelhead have been observed in Swamp Creek, which is approximately 2.6 miles downstream of the action area (Snohomish County 2002, WDFW 2014b). There is a total barrier to fish passage at a beaver pond approximately 2,900 feet downstream of the action area (WDFW 2014a). Based on the lack of observations and the presence of total and partial barriers to fish passage downstream of the action area, steelhead are not expected to use habitats in Scriber Creek or its tributaries in the action area.

Adult steelhead begin entering rivers and streams in the Lake Washington system in November; spawning occurs from March through June of the following year (WDFW 2002). After hatching, Puget Sound steelhead typically mature by 18 months of age and migrate to sea at age 2, with smaller numbers of fish emigrating to the ocean between 1 and 3 years of age. Seaward migration by juveniles commonly occurs from April to mid-May, with fish typically spending 1 to 3 years in the ocean before returning to fresh water (Busby et al. 1996). In some populations, not all adult steelhead die immediately after spawning. These surviving adults (kelts) migrate back to marine environments, possibly returning to freshwater habitats to spawn again in future years. Most kelts move downstream immediately after spawning (Shapovalov and Taft 1954, Null et al. 2013, Johnson and Jones 2000). A small proportion of kelts may remain in freshwater habitats for longer periods. Such emigration delays are associated with late snow pack and cold water temperatures (Johnson and Jones 2000)—conditions that are not likely to occur in the action area.

Based on the above, steelhead may be present in the action area from November through June. During these months, adult steelhead spawning in downstream reaches of Thornton Creek and McAleer Creek may venture upstream into the action area in both streams. Based on the low number of naturally spawned (i.e., ESA-listed) steelhead in the Lake Washington system, the probability that any of the fish that spawn in these streams may belong to the Puget Sound DPS is very low. No other stream reaches in the action area are accessible to steelhead. Juvenile fish are not expected to be present in any streams in the action area at any time because no spawning is known or expected to occur in stream reaches within or upstream of the action area. The presence of residual kelts in the action area outside of the months of November through June is extremely unlikely because (1) the number of fish in the Lake Washington population is extremely small, (2) kelts generally make up a small proportion of any population, (3) only a small proportion of kelts may remain in freshwater habitats beyond the typical spawning period, and (4) emigration delays are associated with climatic conditions that are not likely to occur in the action area.

5.4 Steelhead Critical Habitat

Critical habitat for Puget Sound steelhead was proposed for designation in 2013 (78 FR 9 2726, January 14, 2013). Habitat areas in the Lake Washington system were proposed for exclusion from designation due to economic impacts. None of the water bodies in the action area was included in the proposed designation.

5.5 Bull Trout

Bull trout is listed as a threatened species (64 FR 58910, November 1, 1999). All bull trout in the coterminous United States, including the Coastal-Puget Sound DPS, are included in the listing. Bull trout have been observed entering Lake Washington in small numbers, but none of the streams in the action area is known or expected to support bull trout spawning or rearing. The only spawning population of bull trout documented in the Lake Washington system is in the upper Cedar River above Chester Morse Lake, which is upstream of a natural barrier to upstream migration (Shared Strategy for Puget Sound 2007). No spawning activity or juvenile rearing has been observed anywhere else in the basin. No bull trout have been documented in any of the tributaries to Lake Washington within the action area (WDFW 2014b).

WDFW (1999) determined that successful spawning by bull trout occurs only upstream of the winter snow line (i.e., the elevation at which snow is present on the ground for much of the winter). No such areas are found in the Thornton Creek, McAleer Creek, or Scriber Creek basins. There is no potential, therefore, for the streams in the action area to be used by spawning or rearing bull trout.

USFWS (2004) has identified bull trout foraging, migration, and overwintering habitat in the Lake Washington basin in the lower Cedar River, Sammamish River, Lake Washington, Lake Sammamish, Lake Union, the Lake Washington Ship Canal, and all accessible tributaries. However, based on the number of fish passage barriers between the action area and Lake Washington (where bull trout have been observed), the streams in the action area are unlikely to be accessible tributaries. In addition, habitat conditions in these streams are not expected to support use by bull trout. Stream temperatures in Thornton Creek, McAleer Creek, and Scriber Creek exceed the optimal requirements for all life stages of bull trout (less than 15 degrees Celsius) for much of the year. Any fish attempting to gain access to any of the streams in the action area would have to negotiate several miles of stream habitat with elevated temperatures and multiple barriers. In light of these impediments, the potential for bull trout to use habitats in the action area for foraging, migration, or overwintering is negligible.

5.6 Bull Trout Critical Habitat

Critical habitat was designated for bull trout in 2005 and redesignated in 2010 (75 FR 63898, October 18, 2010). The final rule identified Lake Washington as designated critical habitat for bull trout but excluded tributary streams to Lake Washington (75 FR 63898, October 18, 2010). The action area thus does not include any designated critical habitat for bull trout.

6 EFFECTS ANALYSIS AND EFFECTS DETERMINATIONS

6.1 Direct Effects

Direct effects are defined as direct or immediate effects of the project on the species or its habitat. Potential direct effects of the Lynnwood Link Extension include short-term construction impacts and effects from operation of the light rail system.

6.1.1 Direct Effects from Construction Activities

Construction effects are considered short term, meaning the ecological functions of affected area are expected to return to pre-impact performance within about 1 year or one growing season of the completion of construction activities. Project activities with the potential for direct effects on ESA-listed species include ground-disturbing work and equipment use near streams. In addition, it is possible that some in-water work may take place within the wetland complex surrounding Scriber Creek near the Lynnwood Transit Center. Potential effects of these activities include temporary loss or degradation of in-stream or riparian habitat (including hydrology or water quality), and disturbance of fish in waters where in-water work occurs. Table 6-1 provides an overview summary of effects.

Table 6-1. Summary of Potential Impacts from Construction Activities

Segment	Stream	ESA-Listed Species Potentially Present	Construction Activities	Potential Impacts
A–C	All streams	Chinook salmon, steelhead	Earthwork and grading	Potential release of turbid water or pollutants. Temporary disturbance of riparian vegetation, wetlands, and wetland buffers.
A	Thornton Creek	Steelhead	Elevated crossing, grading and earthwork	Potential release of turbid water or pollutants, temporary disturbance of riparian vegetation, wetlands, and wetland buffers.
A	Stream SSE1	None	Elevated guideway through stream buffer	Potential release of turbid water or pollutants, temporary disturbance of riparian vegetation, wetlands, and wetland buffers.
B	Stream SSH2	None	Elevated crossing of piped stream	None: No potential for runoff from construction areas to reach surface-flowing reaches.
B	McAleer Creek	Chinook salmon, steelhead	Elevated crossing, grading and earthwork	Potential release of turbid water or pollutants, temporary disturbance of riparian vegetation, wetlands, and wetland buffers.
B	Stream SSH4	None	Elevated guideway through stream buffer	Potential release of turbid water or pollutants, temporary disturbance of riparian vegetation, wetlands, and wetland buffers.
B	Stream SMT1	None	Elevated crossing, grading and earthwork	Potential release of turbid water or pollutants, temporary disturbance of riparian vegetation, wetlands, and wetland buffers.
C	Scriber Creek	None	Elevated crossing, possible in-water construction	Potential release of turbid water or pollutants, temporary disturbance of riparian vegetation, wetlands, and wetland buffers.
C	Stream SLY1	None	Earthwork and grading in paved areas nearby	Potential release of turbid water or pollutants.

Construction-related Sedimentation, Turbidity, and Pollutants

Project activities, including clearing, grading, excavation, and other earthwork in the action area (including construction of stormwater detention facilities), could result in increased sediment loads entering streams and other water bodies. Any earthwork conducted within a basin has the potential to cause sedimentation and turbidity that would adversely affect the streams in the basin downstream of the work activity. The most obvious situation in which this could occur is where earthwork construction occurs in or next to a stream channel. However, any earthwork in a basin might contribute to the already serious sedimentation problems that exist in the streams in the project vicinity. This is because most stormwater in urban settings is collected in a system of pipes or ditches and conveyed directly to the nearest stream. An exception to this practice is in newer developments, where stormwater detention facilities trap much of the sediment carried by upstream sources before discharging into streams. But even in these developments, some of the finer sediments might be discharged to streams as the ponds fill with stormwater and overflow.

Where drilled shafts are used to support elevated guideways, shafts may need to be dewatered before concrete is poured. Drilling spoils may also need to be dewatered. Water recovered during the dewatering process can cause increased turbidity in receiving waters if it is not properly detained and treated. Recovered water will be treated to meet the appropriate permit requirements before being discharged.

As discussed in Chapter 3, Action Area, construction-related sedimentation and turbidity could extend downstream to points 200 feet from the stream crossings of Thornton Creek and Scriber Creek, and 100 from the crossings of the other surface-flowing streams in the action area (McAleer Creek and Stream SMT1). Any fish present in those areas would be exposed to an elevated risk of adverse effects, such as gill abrasion, interference with vision, and decreased availability of food sources. However, BMPs will be implemented during project construction to reduce the potential for the introduction of sediment into water bodies (including wetlands) in the action area. BMPs recommended for the project are identified in Chapter 2, Best Management Practices and Minimization Measures.

Potential effects will be substantially minimized or eliminated because work near or within streams (such as for the construction of the elevated guideway across Scriber Creek) will comply with the terms of permits obtained from federal, state, and local agencies. All work below the ordinary high water mark of any waterbodies will be conducted in accordance with the HPA issued by WDFW and by the Clean Water Act Section 404 permit issued by the Corps. Such permits typically include seasonal restrictions and/or other measures intended to minimize the risk of adverse effects on fish during highly sensitive life history stages (e.g., spawning, rearing). Permits for work in tributaries to Lake Washington commonly require in-water work to be conducted during the summer (likely July and August). During those months, no ESA-listed fish species are expected to be present in any of the streams in the action area. Permits required under local critical areas ordinances typically include provisions for the protection of water quality and riparian habitat, further reducing the potential for adverse effects on fish and fish habitat. In addition, BMPs such as silt fences and erosion control devices will reduce the risk of sediment delivery. Although ESA-listed fish species could occasionally

occur in water bodies within or downstream of the action area, the timing of construction activities and the implementation of BMPs are expected to minimize or possibly eliminate the potential for any adverse effects of construction-related sedimentation or turbidity on these species.

Project activities in or adjacent to water bodies also have the potential to introduce pollutants through spills of fuel, hydraulic fluid, or other substances. As discussed above, all work in or near water bodies in the action area will comply with the terms of federal, state, and local permits, minimizing the potential for pollutants to be carried from work sites to water bodies by stormwater. In addition, all work will be conducted in compliance with the SPCC plan for the project, and BMPs will be implemented to prevent construction-related pollutants from entering streams. Based on these factors, the potential for construction activities to result in the introduction of pollutants into waters that support ESA-listed fish is extremely low.

Where the proposed alignment crosses Scriber Creek, construction of the elevated guideway will entail the placement of support columns below the ordinary high water mark, which is currently defined as encompassing the entire wetland complex that surrounds the creek. Temporary work trestles will be constructed for equipment access. Trestle construction will require the use of impact pile driving. However, no ESA-listed species occur in this area. The potentially affected reach of Scriber Creek is approximately 2,900 feet upstream of a barrier that prevents access to the action area by ESA-listed fish species. In addition, work will take place in accordance with federal and state permits that will likely limit work below the ordinary high water mark to periods when water levels are at their lowest. During these periods, surface water in the wetland complex is generally found only in the actively flowing stream channels of Scriber Creek, which make up only a small portion of total wetland complex area. Most work below the ordinary high water mark will take place in areas where no standing or flowing water is present. Any work areas where surface water is present will be isolated from other surface waters with a coffer dam or similar system to prevent suspended sediment or pollutants from leaving the work area. For these reasons, in-water work in Scriber Creek, if it occurs, is not expected to contribute to elevated levels of sediment or pollutants in waters that support ESA-listed fish.

In-water Work

No in-water work is proposed in streams where ESA-listed species are known or expected to occur (Thornton and McAleer creeks). As noted above, some work will occur below the ordinary high-water mark of Scriber Creek where the stream has an ill-defined channel through the wetland complex west of the Lynnwood Transit Center. However, no ESA-listed species occur in this area, and most work below the ordinary high water mark will take place in areas where no standing or flowing water is present. A vibratory hammer will be used for initial installation of most piles. If substrates preclude the use of a vibratory hammer, an impact hammer will be used. For all piles, an impact hammer will be used to complete the installation and to confirm the load-bearing capacity of each pile. Any work below the ordinary high water mark of Scriber Creek will be conducted in accordance with the terms of the HPA and other applicable permits obtained for this project.

Potential effects of in-water work in Scriber Creek include the delivery of sediment and pollutants (discussed in Section 6.1.1.1) and the disturbance or injury of fish due to elevated sound energy levels. If any vibratory or impact pile driving occurs in wetted areas, sound energy will travel in straight lines and not follow the contours of the stream channel. Based on the sinuous, braided, and indistinct form of Scriber Creek's channel in the action area, sound energy from any in-water pile driving will not extend more than a few hundred feet upstream or downstream of the location of the activity and will be blocked by the bends in the stream before it reaches the culvert under I-5 immediately downstream of the action area. The outlet of that culvert is more than 2,000 feet upstream of any stream reaches that are known or expected to support ESA-listed fish. Therefore, noise from in-water work will have no potential to adversely affect ESA-listed fish species.

Temporary Loss of Riparian and Wetland Vegetation

Project construction will result in the temporary loss of riparian vegetation adjacent to Thornton Creek, Stream SSE1, Stream SSH4, McAleer Creek, Scriber Creek, and Stream SMT1 (tributary to McAleer Creek). The other two watercourses in the action area (SSH2 and SLY1) will not be affected. Stream SSH2 will not be affected because it has no surface-flowing segments within 200 feet of ground-disturbing activities. All project construction activities within 200 feet of SLY1 will occur in currently paved areas and therefore will not affect the condition of the stream's riparian buffer.

Riparian vegetation may need to be cleared for site access to construct sections of elevated guideway that cross over streams. Short-term clearing may result in reduced shading, potentially leading to elevated stream temperatures until vegetation becomes reestablished in disturbed areas. Riparian vegetation removal can also reduce insect recruitment to the water bodies below and limit recruitment of large woody debris. In addition, existing trees will be replaced with lower-growing native vegetation.

The project will result in the temporary disturbance of up to 0.7 acre of wetland buffer and up to 0.5 acre of wetland habitat (see Table 6-2). These areas will be cleared to access the work areas where support column foundations will be placed. Wetlands and buffers will be avoided to the extent possible when placing support columns. Temporary fill may be placed for equipment access; this fill will be removed when construction is complete. All cleared areas will be revegetated after construction. In some of the potentially affected areas, existing vegetation is dominated by non-

Table 6-2. Temporary Direct Impacts on Riparian Areas, Wetlands, and Wetland Buffers

Segment	Riparian Area Affected (acres) [1]	Wetland Area Affected (acres)[1]	Wetland Buffer Area Affected (acres) [1]	Comments
A	0	0	0	Impacts will be permanent, not temporary
B	0.6	0.2	0.6	McAleer Creek riparian area: 0.4 acre. Stream SMT1 riparian area: 0.2 acre.
C	0.4	0.3	0.1	Scriber Creek riparian area impacts estimated as sum of wetland and wetland buffer impacts.
Total	1.0	0.5	0.7	

[1] All values in this table are estimates based on preliminary surveys conducted before formal delineations were complete.

native and invasive plant species. Sound Transit anticipates that replanted vegetation will result in improved habitat function where non-native species are replaced with native plants.

6.1.2 Direct Effects from Operation Activities

Permanent effects of Lynnwood Link Extension operations include long-term effects for which habitat functions will not be restored over time. Permanent effects include permanent loss of vegetation, new impervious area, and shading from elevated structures (see Table 6-3).

Table 6-3. Summary of Potential Permanent Operational Impacts

Segment	Stream	ESA-Listed Species Potentially Present	Operation/Structure	Potential Impacts (*Will Be Mitigated*)
A–C	All streams	Chinook salmon, steelhead	New impervious area from guideway and other light rail facilities	Permanent loss of riparian vegetation, wetlands, and wetland buffer vegetation. Overall increase in impervious surface area, slight decrease in total PGIS.
A	Thornton Creek	Steelhead	Elevated crossing	New impervious surface. Permanent loss of riparian vegetation, wetlands, and wetland buffer vegetation.
A	Stream SSE1	None	Elevated guideway through stream buffer	New impervious surface. Permanent loss of riparian vegetation, wetlands, and wetland buffer vegetation.
B	Stream SSH2	None	Elevated crossing of piped stream	None: No modifications to riparian habitat within 200 feet of surface-flowing reaches, no discharges to stream from new impervious surfaces.
B	McAleer Creek	Chinook salmon, steelhead	Elevated crossing	New impervious surface. Permanent loss of riparian vegetation, wetlands, and wetland buffer vegetation.
B	Stream SSH4	None	Elevated guideway through stream buffer	New impervious surface. Permanent loss of riparian vegetation, wetlands, and wetland buffer vegetation.
B	Stream SMT1	None	Elevated crossing	New impervious surface. Permanent loss of riparian vegetation, wetlands, and wetland buffer vegetation. Potential for guideway support columns to interfere with possible future habitat restoration projects.
C	Scriber Creek	None	Elevated crossing, possible in-water construction	New impervious surface. Permanent loss of riparian vegetation, wetlands, and wetland buffer vegetation.
C	Stream SLY1	None	Additional facilities in paved areas nearby	Potential for stormwater discharge.

Operation of the Lynnwood Link Extension is not expected to result in any increases in nighttime illumination of fish-bearing waters (which could increase the risk of predation on juvenile salmonids) because the tracks will have no overhead lighting and the train headlights will be directed parallel to the tracks. Lighting at light rail stations is not expected to result in any adverse effects because no stations are proposed within 200 feet of surface-flowing streams that are known or expected to support ESA-listed fish. No impacts on fish passage are anticipated because no new culverts will be added in streams with documented or potential fish habitat and no existing culverts in such streams will be extended. Construction of at-grade or elevated guideways, stations, and ancillary features above streams in culverts (i.e., Stream SSH2) is not expected to affect stream habitat.

Stormwater Management

Sound Transit has a written stormwater policy that guides site selection, design, and operation of stormwater facilities. Sound Transit's policy requires that project managers and engineers first consider low-impact stormwater management (e.g., infiltration, permeable pavements, rain gardens, and engineered soils) before traditional stormwater design options. If LID techniques are not proposed, a written justification must be provided for agency review. Currently, only preliminary stormwater design has been completed. Analyses in this BA incorporate conservative assumptions about stormwater design details. However, it is likely that at least some of the traditional stormwater treatment methods described below will be replaced with LID options with equal or greater treatment and detention benefit.

Overall, the project will increase the amount of impervious surface in the action area by 52 acres (approximately 26 percent). Impervious surfaces can increase stormwater runoff rates, volumes, and pollutant loads. Without mitigation measures such as detention and treatment facilities, these can cause higher flows and degraded water quality in storm sewers and streams. Project impervious areas include new tracks and guideways, stations, park-and-ride lots, maintenance facilities, and new or relocated roads. Project-related parking lots and road realignments are subject to motor vehicle traffic and are considered to be PGIS. The guideway and stations will not be subject to motor vehicle traffic or other sources of potential pollution and will therefore be classified as non-PGIS.

Stormwater from project-related PGIS will be treated to at least basic treatment levels (i.e., a goal of removal of at least 80 percent of suspended solids) and be infiltrated or routed to existing municipal stormwater systems wherever possible. Roadways relocated as a result of the rail alignment will be treated even though the pollutant loading will not be increased, resulting in a modest increase in stormwater treatment in the area. Roadways where average daily traffic volume exceeds 7,500 vehicles will receive enhanced treatment, as will drainage outfalls that do not discharge to basic treatment water bodies. Where enhanced treatment is implemented, it will reduce heavy metal and hydrocarbon contaminants in stormwater. Basic treatment will reduce hydrocarbon contaminants.

The WSDOT Highway Runoff Dilution and Loading (HI-RUN) model was used to assess the potential for project-related changes in PGIS to affect water quality in streams where ESA-listed fish may be present. The results of this exercise are summarized below and presented in greater detail in Appendix D.

In most areas where the Lynnwood Link Extension will change the amount of PGIS draining to streams where ESA-listed fish may be present, model results indicate that pollutant loading will decrease under proposed conditions, suggesting probable improvements in water quality. Therefore, stormwater runoff from the Lynnwood Link Extension will not have any adverse effects on ESA-listed fish in nearly all portions of the action area.

At one location, model results indicate a probable increase in pollutant loadings in receiving waters, necessitating additional analysis of the potential for adverse effects on ESA-listed fish. The area in question is in the vicinity of the NE 185th Street Station, where construction of the station and associated parking areas, combined with the relocation of 5th Avenue NE, will result in the creation

of 2.45 acres of new PGIS, all of which will be treated in new facilities. These facilities include two enhanced treatment facilities for the parking garage and relocated portions of 5th Avenue NE, and an infiltration facility for the bus turnaround area east of I-5 and north of NE 185th Street. The increase in PGIS will be offset partially but not entirely by decreases resulting from the relocation of 5th Avenue NE south and east of I-5. None of the existing PGIS currently receives water quality treatment.

Under most conditions, there will be no surface connection between the infiltration facility and any streams in the action area. However, the emergency overflow from the facility, as well as treated water from the other two facilities, will drain north in an existing stormwater trunk line, emptying to a non-fish-bearing tributary to McAleer Creek (Stream SSH2) approximately 3,500 to 4,200 feet away. The treated water will then travel another 1,400 feet, mostly in pipes, before emptying to a reach of McAleer Creek where steelhead and Chinook salmon may be present. Neither species is known or expected to use that reach for spawning.

Because the HI-RUN model results indicate a high likelihood of increased pollutant loadings at this location, additional modeling (the HI-RUN dilution subroutine) was conducted to investigate the potential for adverse effects on ESA-listed fish in McAleer Creek. The output of the dilution subroutine presents a conservative distance (mixing zone) downstream of the outfall, where there is a 5 percent chance that pollutant concentrations will exceed thresholds for effects on fish. The effects thresholds are based on potential increases of dissolved copper and dissolved zinc above background concentrations.

Results of the HI-RUN dilution subroutine showed mixing zone distances less than 1 foot under both baseline and proposed conditions, indicating a minimal risk of adverse effects. These results suggest an extremely low probability for stormwater runoff from the Lynnwood Link Extension to result in adverse effects on ESA-listed fish in McAleer Creek.

Sound Transit's preliminary engineering for the Lynnwood Link Extension includes development of a conceptual layout for major stormwater facilities to comply with the *Stormwater Management Manual for Western Washington* (Ecology 2012a). These facilities include stormwater ponds and underground vaults. Additional measures to reduce stormwater runoff, such as LID or other on-site measures, will be considered in accordance with Sound Transit's stormwater policy.

Peak stream flows in the action area are not expected to increase substantially because the stormwater systems built for the project will be designed to simulate predevelopment hydrology. As stated in the *Stormwater Management Manual for Western Washington*, "The Manual is intended to provide project proponents, regulatory agencies and others with technically sound stormwater management practices which are presumed to protect water quality and in-stream habitat – and meet the stated environmental objectives of the regulations described in this chapter." It is possible, however, that discharges from detention facilities could result in increased velocities and durations of peak flows in receiving waters, potentially reducing the availability of forage and displacing juvenile salmonids from cover (Tschaplinski and Hartman 1983).

In addition, impervious surfaces preclude natural infiltration of precipitation into the ground, which decreases groundwater recharge. Less precipitation entering groundwater aquifers might decrease dry-season base flows by decreasing water inputs to streams from groundwater sources such as springs. Dry-season base flows have been identified as one of the most important natural limiting factors controlling salmonid production in lowland Puget Sound streams (Mathews and Olson 1980).

Where low-impact development measures are implemented, some stormwater runoff from project-related impervious surfaces will be collected and infiltrated into the ground. In some areas, this could result in increased groundwater recharge compared to existing conditions (under which stormwater runoff is managed mainly through vaults and ponds that do not infiltrate). However, some soil types in the project area are not conducive to infiltration of precipitation into the ground.

Permanent Impacts to Riparian and Wetland Areas

Permanent impacts could occur where the project limits cross streams, riparian areas, wetlands, or wetland buffers. The project limits include the guideway, station footprints (including parking), roadway improvements, storm drainage ponds, and other ancillary features. In addition, a 15-foot clear zone will be maintained on either side of the guideway to prevent damage to catenary wires from falling vegetation. Existing trees in this zone will be cleared and replaced with lower-growing native shrubs or trees. Also, some trees in areas beyond the 15-foot clear zone may need to be removed to protect light rail safety and reliability. Removal of such hazard trees may continue as a maintenance activity throughout the operational life of project facilities.

Where existing riparian and wetland vegetation will be cleared at the elevated stream crossing sites, there are many areas where the existing vegetation consists of invasive species, especially Himalayan blackberry and reed canarygrass. These areas will be cleared of invasive species and replanted with native vegetation after construction.

Up to 2.3 acres of riparian area, 2.4 acres of wetlands, and 3.0 acres of wetland buffers will be affected by the project (see Table 6-4). Much of the affected area falls within the footprint of elevated guideways and thus may not be subject to long-term impacts (see below for additional discussion of long-term effects of elevated guideways). Sound Transit will use compensatory mitigation to replace the area and functions lost for any riparian areas, wetlands, and wetland buffers that cannot be avoided or adequately minimized. Mitigation for impacts to wetlands and wetland buffers that are also within riparian areas will meet the local and federal mitigation requirements for wetlands or wetland buffers because those requirements are more stringent and specific than those for riparian mitigation. As appropriate, Sound Transit will apply the federal Final Compensatory Mitigation Rule (40 CFR Part 230); appropriate current available agency regulations; guidelines established jointly by Ecology, the Corps, and U.S. Environmental Protection Agency in *Wetland Mitigation in Washington State* (Ecology et al. 2006); and local critical areas ordinances for the cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood.

Table 6-4. Permanent Direct Impacts on Riparian Areas, Wetlands, and Wetland Buffers

Segment	Riparian Area Affected (acres) [1]	Wetland Area Affected (acres)[1]	Wetland Buffer Area Affected (acres) [1]	Comments
A	0.7	0.9	0.4	Thornton Creek riparian area: 0.5 acre. Stream SSE1 riparian area: 0.2 acre.
B	1.1	0.8	1.6	McAleer Creek riparian area: 0.5 acre. Stream SMT1 riparian area: 0.5 acre. SSH2 and SSH4 riparian areas: <0.1 acre each.
C	0.5	0.7	1.0	Scriber Creek riparian area impacts are estimated as the area of the project footprint overlapping the Scriber Creek wetland complex.
Total	2.3	2.4	3.0	

[1] Values in this table are estimates based on preliminary surveys conducted before formal delineations were complete. In addition, estimates of riparian area impacts are based on the total area within riparian buffers, including road surfaces and other areas that do not currently provide riparian functions. Moreover, these estimates include all areas within the project limits, including both at-grade and elevated guideways. Based on factors such as the structure's height, width, and orientation, some areas within the footprint of elevated guideways may not be subject to long-term impacts. As such, values in this table are likely overestimates of the extent of potential impacts on riparian areas, wetlands, and wetland buffers. Also, as noted above, mitigation for overlapping impacts will be based on local and federal mitigation requirements for wetlands or wetland buffers rather than requirements for riparian areas.

For this analysis, estimates of the amount of potentially affected riparian habitat area are based on the amount existing vegetation within the regulatory buffer that each local jurisdiction requires for each potentially affected stream. These buffer distances were selected because little functional riparian habitat currently exists or is likely to persist outside of these buffers. In addition, most riparian functions are provided by vegetation within the areas defined by these buffers. For example, studies conducted in western Washington, western Oregon, and southeast Alaska indicate that more than 90 percent of large woody debris input to streams from riparian areas is recruited from the areas within one-half of a site's potential tree height[2] (Murphy and Koski 1989, McDade et al. 1990, McKinley 1997, Martin et al. 1998). Based on an estimated site potential tree height of 200 feet, most potential recruitment of large woody debris to streams in the action area would be expected to come from the areas within regulatory buffers, and nearly all recruitment would come from within 100 feet. Construction of at-grade facilities outside of regulatory buffers, therefore, is expected to result in minimal (if any) reductions in wood recruitment to action area streams.

No construction of at-grade guideways, stations, or ancillary features will occur within the regulatory buffers of any surface-flowing streams in the study area. The only permanent project-related impacts on riparian habitat will occur where elevated guideways span areas of riparian vegetation. Within the Scriber Creek wetland complex, placement of guideway support columns will result in the permanent loss of some riparian habitat for that stream. Trees and other tall vegetation underneath and within 15 feet of all elevated guideways will be permanently cleared for safety. In addition, construction of elevated guideways above vegetation will reduce the amount of water the vegetation receives from precipitation. In addition, guideways with low clearance (generally, less than 15 feet) may limit sunlight. In some areas, vegetation cleared from beneath

[2] Site potential tree height is the average maximum height of the tallest dominant trees (200 years or older) at a given location, based on the soil and climatic conditions at that site. Site potential tree heights in the Puget Sound lowlands can extend up to 200 feet.

elevated guideways may not grow back. The presence of elevated guideways will preclude the development of mature forest habitat in such areas, reducing the potential for the recruitment of large woody debris to nearby streams.

Because the elevated guideway structures will be relatively narrow (31 feet wide) and generally more than 15 feet above the ground surface, shading impacts on riparian vegetation would be limited in most areas, although some impacts would result from shading and water interception. As learned from the Sound Transit Central Link project, herbaceous plants and shrubs are generally able to grow beneath narrow guideways that are at least 15 feet above the ground (Sound Transit 2011). Based on the nature and location of buffer impacts, as well as the current condition of vegetation within the buffers, no substantial degradation of riparian functions (e.g., fish and wildlife habitat, food chain support, or water temperature maintenance) or processes is expected to result from project-related clearing. The riparian processes not expected to be affected include water flow; erosion and accretion; infiltration; groundwater recharge and discharge; sediment delivery, transport, and storage; organic matter input; nutrient and pathogen removal; and stream channel formation and maintenance.

Another factor influencing the potential effects of elevated guideways on vegetation is the orientation of the guideway relative to the path of the sun across the sky. Over the course of a day, the sun appears to travel from east to west. If a relatively narrow feature such as a guideway is oriented north-to-south, most areas under the feature will receive sunlight during the morning and afternoon hours, when the sun is in the eastern and western sectors of the sky. The potential for sunlight to reach areas underneath a feature that is oriented east-to-west is much more limited.

The potential for the project to result in long-term effects on ESA-listed species in specific areas of each project segment is discussed further in the following subsections.

Segment A: Northgate to Shoreline

Thornton Creek

The elevated guideway will be approximately 40 feet above the surface-flowing segment of Thornton Creek in the action area. Based on the observation of a single adult steelhead upstream of this location in 2004, it is possible that steelhead could use stream habitats in this reach. Most or all trees currently in this riparian area will likely be removed and replaced with shrubs and other lower-growing native vegetation. The guideway will be oriented north-to-south, allowing sunlight to reach the new vegetation. Both the guideway and the new vegetation will provide shade to the stream. The loss of riparian trees could reduce the potential for delivery of large woody debris to the stream. Only the reach immediately beneath the guideway will be affected, however, because the culverts under 5th Avenue NE and other physical barriers already prevent large woody debris from being carried to other reaches downstream. Impacts to wetlands and wetland buffers will be mitigated as required by local and federal agencies.

Stream SSE1

The elevated guideway will be approximately 40 feet above the vegetated area adjacent to the surface-flowing segment of this non-fish-bearing watercourse in the action area. Some existing trees in the riparian area of this watercourse will likely be removed and replaced with shrubs and other lower-growing native vegetation. The guideway will be oriented north-to-south, allowing sunlight to reach the new vegetation. Both the guideway and the new vegetation will provide shade to the water. The loss of riparian trees could reduce the potential for delivery of large woody debris to the watercourse. Only the 100-foot-long reach immediately adjacent to the project alignment will be affected, however, because several culverts in the project area already prevent large woody debris from being carried to other reaches downstream. Impacts to wetlands and wetland buffers will be mitigated as required by local and federal agencies.

Segment B: Shoreline to Mountlake Terrace

McAleer Creek and Stream SSH4

The elevated guideway will pass through the riparian buffers of two segments of McAleer Creek where it flows at surface through cloverleaf interchanges between I-5 and SR 104; vegetation in the southeastern cloverleaf also provides riparian habitat for Stream SSH4. Both Chinook salmon and steelhead may use stream habitats in McAleer Creek in the action area. The route will also cross McAleer Creek as an elevated guideway where the stream emerges from a 400-foot culvert under I-5. The guideway will be approximately 60 feet above the stream at that location.

Some existing trees in the riparian areas of the surface-flowing segments in the two cloverleaf interchanges will likely be removed and replaced with shrubs and other lower-growing native vegetation. The guideway will be oriented north-to-south, allowing sunlight to reach the new vegetation. Both the guideway and the new vegetation will provide shade to the stream. The loss of riparian trees could reduce the potential for delivery of large woody debris to the stream. Only the reaches immediately adjacent to the Lynnwood Link Extension alignment will be affected, however, because the culverts under SR 104 and the I-5 on-ramps and off-ramps already prevent large woody debris from being carried to other reaches downstream. Impacts to wetlands and wetland buffers will be mitigated as required by local and federal agencies.

Stream SSH2

The entire length of this non-fish-bearing watercourse through the action area is contained in a culvert. Construction of the elevated guideway at the crossing location will not affect any vegetation within the riparian buffer of any surface-flowing segments of the stream.

Stream SMT1

The elevated guideway will be approximately 60 feet above this non-fish-bearing intermittent stream. Some existing trees in the riparian area of this stream will likely be removed and replaced with shrubs and other lower-growing native vegetation. The guideway will be oriented north-to-south, allowing sunlight to reach the new vegetation. Both the guideway and the new vegetation will provide shade to the stream. The loss of riparian trees could reduce the potential for delivery of

large woody debris to the stream. Only the reaches immediately adjacent to the project alignment will be affected, however, because several culverts in the project area already prevent large woody debris from being carried to other reaches downstream. Impacts to wetlands and wetland buffers will be mitigated as required by local and federal agencies.

Segment C: Lynnwood

Scriber Creek

The elevated guideway will be approximately 50 to 60 feet above this stream where it flows through the Scriber Creek wetland complex. No ESA-listed species are known or expected to use habitats in this stream reach, which is approximately 2,900 feet upstream of a total barrier to fish passage.

Most existing vegetation in the riparian area consists of willows and other low-growing species that may not need to be removed for safety reasons. However, some cottonwoods and other tall trees at the southern periphery of the wetland complex may be removed and replaced with shrubs and other lower-growing native vegetation. The guideway orientation in this area will be northeast-to-southwest, meaning sunlight will be able to reach new vegetation but possibly not to as great an extent as in the riparian areas of Thornton Creek and McAleer Creek. Both the guideway and the new vegetation will provide shade to the stream. The loss of riparian trees could reduce the potential for delivery of large woody debris to the stream. Only the reaches immediately adjacent to the project alignment will be affected, however, because several culverts in the action area already prevent large woody debris from being carried to other reaches downstream. As noted in Chapter 4, Environmental Baseline, Jones and Stokes (2000) found little to no large woody debris in the stream and determined that the potential for large woody debris recruitment is low. Impacts to wetlands and wetland buffers will be mitigated as required by local and federal agencies.

Stream SLY1

No portions of the project footprint intersect the vegetated area of the riparian buffer of this non-fish-bearing stream. All project construction activities within 200 feet of the stream will occur in currently paved portions of the transit center and therefore will not have any potential to affect the stream or its riparian buffer.

6.2 Indirect Effects

Indirect effects are defined as those that are caused by the proposed action and are later in time, but still are reasonably certain to occur (50 CFR § 402.02).

The Lynnwood Link Extension light rail system is projected to be used for approximately 68,000 trips per day in 2035, more than double the bus ridership that would be expected in the absence of the project (Sound Transit and Federal Transit Administration 2013). This is expected to reduce vehicle miles traveled by approximately 270,000 to 290,000 miles per day, and vehicle hours traveled by approximately 23,000 to 25,000 per day, with corresponding reductions in energy use, emissions, and related pollutants from vehicular traffic. A substantial portion of the anticipated reduction is expected to occur within the project corridor as new riders shift from automobiles to transit.

During the scoping process and preparation of the Lynnwood Link Extension Draft EIS (Sound Transit and Federal Transit Administration 2013), Sound Transit gathered information from other agencies and the public to identify proposed development projects that are reasonably certain to occur and that are contingent upon or caused by the project. Examples of information sources include land use plans, transportation plans, neighborhood plans, major transportation and land use proposals, and growth management plans from local municipalities, the Puget Sound Regional Council, and other organizations and the public.

Based on the information reviewed, no proposed development projects contingent upon or caused by the Lynnwood Link Extension are reasonably certain to occur. Light rail transit may contribute to existing market forces that can increase the potential for transit-oriented development. The experience of other U.S. communities has shown that, although light rail transit may not by itself create new development, with transit-supporting plans and policies in place, it can influence where development would occur and the types of development that occur. The Lynnwood Link Extension will provide mobility options that could help achieve higher land use densities, thereby encouraging reduction of land development area in ways that are consistent with regional and local plans and policies. Density will increase without construction of light rail; however, light rail will help achieve goals that encourage high-density, transit-oriented development (Sound Transit and Federal Transit Administration 2013).

6.3 Interrelated/Interdependent Actions

Interrelated actions are defined as actions that are part of a larger action and depend on the larger action for their justification. Interdependent actions are those that have no independent utility apart from the action under consideration (50 CFR § 402.02). The Lynnwood Link Extension light rail line is part of a regional transportation improvement plan, but it does not depend on any other portion of the plan for its justification. The Lynnwood Link Extension is a stand-alone project that has independent utility, and no other proposed actions depend upon the Lynnwood Link Extension for their utility.

6.4 Effects Determinations

Table 6-5 summarizes the effects determinations for each species and critical habitat considered in this analysis. The rationale for each determination is provided in the following subsections.

6.4.1 Puget Sound Chinook Salmon

Project activities with the potential to affect Chinook salmon include construction and operation of light rail facilities near streams where this species might occur, as well as changes in runoff rates, volumes, and pollutant loads in water bodies that receive discharge from stormwater treatment facilities associated with the project.

The project may affect Puget Sound Chinook salmon for the following reasons:

- Adult Chinook salmon may occur in reaches of McAleer Creek within the action area.

Table 6-5. Effects Determinations for ESA-Listed Species and Critical Habitat

Species	Status	Federal Jurisdiction	Effects Determination
Chinook salmon, Puget Sound ESU	Threatened	NMFS	NLAA
Chinook salmon critical habitat	Designated	NMFS	NE
Steelhead, Puget Sound DPS	Threatened	NMFS	NLAA
Steelhead critical habitat	Proposed	NMFS	NE
Bull trout	Threatened	USFWS	NE
Bull trout critical habitat	Designated	USFWS	NE

ESU–Evolutionarily Significant Unit
DPS–Distinct Population Segment
NE–No Effect
NLAA–Not Likely to Adversely Affect
NMFS–National Marine Fisheries Service
USFWS–United States Fish and Wildlife Service

- Sediment or pollutants generated by construction activities could be released into surface waters.
- Increases in the amount of impervious surface in the action area could result in increased velocities and durations of peak flows in receiving waters.
- Removal of riparian vegetation due to project construction could disrupt riparian functions in stream reaches where Chinook salmon may be present.

The project is not likely to adversely affect Puget Sound Chinook salmon for the following reasons:

- None of the streams in the action area provide spawning habitat for Chinook salmon; therefore, potential impacts to that life stage are considered discountable.
- The potential for stream reaches in the action area to provide suitable rearing, foraging, or refuge habitat for Chinook salmon is low, based on limited access and poor habitat quality.
- All work below the ordinary high water mark of any waterbodies will be conducted in accordance with the HPA issued by WDFW and with the Clean Water Act Section 404 permit issued by the Corps. Such permits typically include provisions designed to avoid or minimize the risk of adverse effects on fish during sensitive life history stages. Provisions could include restrictions on construction periods below the ordinary high-water mark and/or other measures to avoid or minimize the potential for construction activities to deliver sediment or pollutants to streams.
- Work near streams will comply with permits obtained under local critical areas ordinances, which will likely include provisions for the protection of water quality and riparian habitat, further reducing the potential for adverse effects on fish and fish habitat.
- BMPs will be employed to prevent sediment and pollutants from entering any water body.
- Stormwater runoff from all new PGIS in the action area will receive water quality treatment, minimizing the risk of degradation of water discharged to action area streams.
- To minimize the potential impacts of increased impervious surface, stormwater detention facilities will be constructed as part of the project; the volume detained will be sufficient to offset any increase in impervious surface area in each segment.

- Native riparian vegetation will be replanted immediately after construction. Monitoring and adaptive management will ensure survival of plants in revegetated areas.
- Impacts to wetlands and riparian areas will be mitigated in accordance with regulatory requirements.
- The project is not expected to result in induced growth that would adversely affect habitat for Chinook salmon.

6.4.2 Puget Sound Chinook Salmon Critical Habitat

The areas potentially affected by construction and operation of the Lynnwood Link Extension do not overlap any areas of designated critical habitat for Puget Sound Chinook salmon. The nearest designated critical habitat is in Lake Washington, which is more than 3 miles downstream of the action area. Therefore, the project will have no effect on designated critical habitat for Puget Sound Chinook salmon.

6.4.3 Steelhead

Project activities with the potential to affect steelhead include construction and operation of light rail facilities near streams where this species may occur, as well as changes in runoff rates, volumes, and pollutant loads in water bodies that receive discharge from stormwater treatment facilities associated with the project.

The project may affect Puget Sound steelhead for the following reasons:

- Adult steelhead may occur in reaches of Thornton Creek and McAleer Creek within the action area.
- Sediment or pollutants generated by construction activities could be released into surface waters.
- Increases in the amount of impervious surface in the action area could result in increased velocities and durations of peak flows in receiving waters.
- Removal of riparian vegetation due to project construction could disrupt riparian functions in stream reaches where steelhead may be present.

The project is not likely to adversely affect Puget Sound steelhead for the following reasons:

- None of the streams in the action area provide spawning habitat for steelhead; therefore, potential impacts to that life stage are considered discountable.
- The potential for stream reaches in the action area to provide suitable rearing, foraging, or refuge habitat for steelhead is low, based on limited access and poor habitat quality.
- Based on the low abundance of spawning steelhead in the Lake Washington population (approximately 12 fish), combined with the large amount of readily accessible spawning habitat in the many tributary streams to Lake Washington, the possibility of adult steelhead returning to stream reaches in the action area is very remote.

- All work below the ordinary high water mark of any waterbodies will be conducted in accordance with the HPA issued by WDFW and with the Clean Water Act Section 404 permit issued by the Corps. Such permits typically include provisions designed to avoid or minimize the risk of adverse effects on fish during sensitive life history stages. Provisions could include restrictions on construction periods below the ordinary high-water mark and/or other measures to avoid or minimize the potential for construction activities to deliver sediment or pollutants to streams.
- Work near streams will comply with permits obtained under local critical areas ordinances, which will likely include provisions for the protection of water quality and riparian habitat, further reducing the potential for adverse effects on fish and fish habitat.
- BMPs will be employed to prevent sediment and pollutants from entering any water body.
- Stormwater runoff from all new PGIS in the action area will receive water quality treatment, minimizing the risk of degradation of water discharged to action area streams.
- To minimize the potential impacts of increased impervious surface, stormwater detention facilities will be constructed as part of the project; the volume detained will be sufficient to offset any increase in impervious surface area in each segment.
- Native riparian vegetation will be replanted immediately after construction. Monitoring and adaptive management will ensure survival of plants in revegetated areas.
- Impacts to wetlands and riparian areas will be mitigated in accordance with regulatory requirements.
- The project is not expected to result in induced growth that would adversely affect habitat for steelhead.

6.4.4 Steelhead Critical Habitat

The areas potentially affected by construction and operation of the Lynnwood Link Extension do not overlap any areas of proposed critical habitat for Puget Sound steelhead. The nearest proposed critical habitat is in Lake Washington, which is more than 3 miles downstream of the action area. The project will not destroy or adversely modify any proposed critical habitat for steelhead because no such areas occur in locations that may be affected by project activities.

If steelhead critical habitat is designated before completion of this project, a provisional effect determination for critical habitat is as follows: the project will have no effect on designated critical habitat for Puget Sound steelhead.

6.4.5 Bull Trout

Project activities are expected to have no effect on bull trout because bull trout are neither known nor expected to use habitats in the streams in the action area. None of the streams in the action area has been documented as supporting spawning or rearing by bull trout. Any fish attempting to gain access to any of the streams in the action area would have to negotiate several miles of stream habitat with elevated temperatures and multiple physical barriers. In light of these impediments, the

potential for bull trout to use habitats in the action area for spawning, rearing, foraging, migration, or overwintering is negligible.

6.4.6 Bull Trout Critical Habitat

The areas potentially affected by construction and operation of the Lynnwood Link Extension do not overlap any areas of designated critical habitat for bull trout. The nearest designated critical habitat is in Lake Washington, which is more than 3 miles downstream of the action area. Therefore, the project will have no effect on designated critical habitat for bull trout.

APPENDIX A

Essential Fish Habitat Consultation

ESSENTIAL FISH HABITAT CONSULTATION

Public Law 104-297, the Sustainable Fisheries Act of 1996, amended the Magnuson-Stevens Fishery Conservation and Management Act to establish new requirements for Essential Fish Habitat (EFH) descriptions in federal fishery management plans and to require federal agencies to consult with the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS) on activities that may adversely affect EFH.

The Magnuson-Stevens Act requires all fishery management councils to amend their fishery management plans to describe and identify EFH for each managed fishery. The Pacific Fishery Management Council (1999) has issued such an amendment in the form of Amendment 14 to the Pacific Coast Salmon Plan, and this amendment covers EFH for the Pacific salmon (Chinook salmon, coho salmon, and pink salmon) under NMFS jurisdiction that would potentially be affected by the proposed action.

EFH for Pacific salmon in freshwater includes all streams, lakes, ponds, wetlands, and other currently viable bodies of freshwater and the substrates within those water bodies accessible to Pacific salmon. Activities occurring above impassable barriers that are likely to adversely affect EFH below impassable barriers are subject to the consultation provisions of the Magnuson-Stevens Act.

EFH for groundfish and coastal pelagic species includes all waters from the mean high water line along the coasts of Washington upstream to the extent of saltwater intrusion and seaward to the boundary of the U.S. exclusive economic zone (370.4 km.) (PFMC 1998a and 1998b). Designated EFH for salmonid species in estuarine and marine areas includes nearshore and tidally submerged environments within state territorial water out to the full extent of the exclusive economic zone (370.4 km) offshore of Washington (PFMC 1999). No such areas are present in the action area,

The Magnuson-Stevens Act requires consultation for all federal agency actions that may adversely affect EFH. EFH consultation with NMFS is required by federal agencies undertaking, permitting, or funding activities that may adversely affect EFH, regardless of its location. Under Section 305(b)(4) of the Magnuson-Stevens Act, NMFS is required to provide EFH conservation and enhancement recommendations to federal and state agencies for actions that adversely affect EFH. Wherever possible, NMFS uses existing interagency coordination processes to fulfill EFH consultations with federal agencies. For the proposed action, this goal is being met by incorporating EFH consultation to the Endangered Species Act (ESA) Section 7 consultation, as represented by this Biological Assessment (BA).

The following guilds may be affected by project activities:

☒ Pacific Salmon ☐ Groundfish ☐ Coastal Pelagic Species

Location

In the Lake Washington-Sammamish basin, EFH includes Lake Washington and all of its tributaries currently or historically accessible to salmon, including Thornton Creek, McAleer Creek, and Scriber Creek.

Chinook Salmon

As discussed in Chapter 5, Species and Critical Habitat Status and Occurrence, adult Chinook salmon may use habitat in McAleer Creek within the action area but not for spawning. Access by Chinook salmon to other streams in the action area is blocked by impassable culverts downstream, and flow regimes and substrate structure are not conducive to spawning.

Coho Salmon

Coho salmon have been observed in the action area, within Thornton Creek, McAleer Creek, and Scriber Creek. Portions of McAleer Creek downstream of the confluence with Stream SMT1 provide spawning habitat for coho salmon, while those upstream of that point provide rearing habitat (WDFW 2014b). None of the other streams in the action area is considered to be accessible to coho salmon.

Pink Salmon

Pink salmon are not known or expected to use Lake Washington or its tributaries (WDFW 2014b).

Description of Project Activities

The project activities covered by this BA are described in Chapter 1, Introduction and Project Description. Potential effects of the project to salmonids are discussed in detail in Chapter 6, Effects Analysis and Effects Determination.

Conservation Measures and Best Management Practices

Conservation measures and best management practices (BMPs) are included for project activities and are described in Chapter 2 of this BA. Notably, no work will occur within stream reaches where salmon use has been documented, and project construction is not expected to result in any adverse effects on any salmon species. The project alignment at the crossings of Thornton Creek and McAleer Creek will be elevated, thereby avoiding any direct impacts on stream habitat and minimizing the potential for adverse effects on riparian habitat. WDFW (2014b) has not documented any observations of any salmon species in the action area. Conservation measures will avoid or minimize potential effects to existing habitat conditions, including EFH, within the action area.

Conclusions

In accordance with the EFH requirements of the Magnuson-Stevens Fishery Conservation and Management Act, it has been determined that the project will have the following effect on EFH for the guilds identified below:

☒ Pacific Salmon	☒ No Adverse Effect	☐ Adverse Effect
☐ Groundfish	☒ No Adverse Effect	☐ Adverse Effect
☐ Coastal Pelagic Species	☒ No Adverse Effect	☐ Adverse Effect

The project will have no adverse effects on EFH for groundfish or coastal pelagic species because they do not occur in the areas directly or indirectly affected by the project.

The project will have no adverse effects on EFH for Pacific salmon (including Chinook, coho, and pink salmon) because project construction, including implementation of the conservation measures identified above, is not expected to result in any permanent reduction of quantity or quality of EFH.

APPENDIX B

Biology of Species Addressed in this Analysis

BIOLOGY OF SPECIES ADDRESSED IN THIS ANALYSIS

This appendix details the life history of the species covered in this Lynnwood Link Extension Biological Assessment (BA).

Puget Sound Chinook Salmon (*Oncorhynchus tshawytscha*)

The Puget Sound Chinook salmon evolutionarily significant unit (ESU) encompasses all runs of Chinook salmon from the Elwha River in the Strait of Juan de Fuca eastward, including rivers and streams flowing into Hood Canal, Puget Sound, and the Strait of Georgia in Washington. Of an estimated 31 original populations, there are 22 extant geographically distinct populations representing the primary historical spawning areas of Chinook salmon in the ESU (Good et al. 2005). Of the nine extinct populations, eight were spring Chinook salmon. The extinct spring Chinook salmon populations represented a significant portion of the historical life history diversity and spatial structure of the ESU. Their loss has increased the ESU's risk of extinction.

Long-term trends in abundance and median population growth rates for naturally spawning populations of Puget Sound Chinook salmon indicate that approximately half of the populations are declining and the other half are increasing in abundance. Eight of the 22 populations are declining over the short term, and 11 or 12 populations are experiencing long-term declines (Good et al. 2005). Factors contributing to the downward trends are widespread blockages of streams, degraded freshwater and marine habitat, poor forest practices in upper river tributaries, and urbanization and agriculture in lower tributaries and main stem rivers.

Chinook salmon spawning areas are generally characterized by stream gradients of less than 2 percent, velocities between 1.0 and 3.6 feet per second, depths greater than 0.8 feet, and gravel and cobble substrates as large as 4 inches. Chinook salmon favor the head of riffles and side channels for their redd locations (Healey 1991). The eggs are deposited in gravel that has well-oxygenated water percolating through it (Healey 1991). The eggs overwinter and hatch in the gravel to become juveniles with a yolk-sac. Juveniles emerge from the gravel (usually in late winter), begin to forage on their own, and move downstream into estuaries, where they continue to forage before moving into the North Pacific Ocean and reside for 1 to 5 or more years (Healey 1991).

Stream-type Chinook salmon (spring-run Puget Sound Chinook salmon) migrate into nearshore waters and return to natal streams in spring to early summer. They usually spawn greater distances from salt water than the ocean-type stocks. Ocean-type Chinook salmon (commonly called the fall-run) move to their natal streams in late summer and early fall. These individuals usually spawn lower in rivers than the stream-type stocks. Spring-run Puget Sound Chinook salmon spawn in late August through early October, while fall-run Puget Sound Chinook salmon spawn in late September through October (Healey 1991).

Spring-run Chinook salmon return to rivers when they are reproductively immature and typically hold in deep pools with flowing water for summer holding prior to spawning. Suitable holding pools have depths greater than 5 feet; contain cover from undercut banks, overhanging vegetation, boulders, or woody debris (Lindsay et al. 1986); and have water velocities ranging

from 0.5 to 1.2 feet per second (Marcotte 1984). In the summer, Chinook salmon juveniles prefer areas with water velocities less than 0.7 feet per second, depths between 0.7 and 2.6 feet, and cover (Hillman et al. 1987).

Adult Chinook salmon enter the Lake Washington system from Puget Sound through the Ballard Locks in July through September (Celedonia et al. 2011). Adult Chinook salmon begin entering the spawning streams in September and continue until November. Spawning occurs from October to December, with peak spawning activity usually in the first few weeks of October (Burton et al. 2009). Fry emerge from redds between January and early April (Kiyohara and Zimmerman 2009). Juvenile Chinook salmon in the Lake Washington system appear to have two rearing strategies: some rear in their natal streams and emigrate to the lake as pre-smolts in May, June, or July; others emigrate as fry between January and mid-May and rear in the south or north end of Lake Washington or in Lake Sammamish for several months (Celedonia et al. 2011). All Lake Washington Chinook migrate to marine habitats during their first year.

The largest run of naturally produced Chinook salmon in the Lake Washington basin occurs in the Cedar River. Large numbers of adult fish also spawn in Bear Creek. Small numbers of Chinook salmon spawn in several tributaries to Lake Washington and Lake Sammamish. Most hatchery production occurs at the Washington Department of Fish and Wildlife's Issaquah Creek Hatchery.

The size of historical runs of the ESU were estimated at 670,000. During a recent 5-year period, the geometric mean of natural spawners in populations of Puget Sound Chinook salmon ranged from 222 to just over 9,489 fish. The historical estimates of spawner capacity are several orders of magnitude higher than spawner abundances currently observed throughout the ESU (Good et al. 2005). The NMFS Biological Review Team identified the following risks: (1) the concentration of the majority of natural production in just two basins; (2) high levels of hatchery production in many areas of the ESU; and (3) widespread loss of estuary and lower floodplain habitat diversity. Populations in this ESU have not experienced the sharp increases in the late 1990s seen in many other ESUs, though more populations have increased than decreased since the last Biological Review Team assessment (Good et al. 2005).

Habitat requirements for Chinook salmon are listed by the NMFS in terms of Primary Constituent Elements (PCEs), which include sites that are essential to supporting one or more life stages of the ESU and which contain physical or biological features essential to the conservation of the ESU.

Specific sites and features designated for Puget Sound Chinook salmon include the following:

1) Freshwater spawning sites with water quantity and quality conditions and substrate supporting spawning incubation and larval development
2) Freshwater rearing sites with water quantity and floodplain connectivity to form and maintain physical habitat conditions and support juvenile growth and mobility; water quality and forage supporting juvenile development; and natural cover such as shade, submerged and overhanging large wood, log jams and beaver dams, aquatic vegetation, large rocks and boulders, side channels, and undercut banks

3) Freshwater migration corridors free of obstruction with water quantity and quality conditions and natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, side channels, and undercut banks supporting juvenile and adult mobility and survival

4) Estuarine areas free of obstruction with water quality, water quantity, and salinity conditions supporting juvenile and adult physiological transitions between freshwater and saltwater, natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, and side channels, and juvenile and adult forage, including aquatic invertebrates and fishes, supporting growth and maturation

5) Nearshore marine areas free of obstruction with water quality and quantity conditions and forage, including aquatic invertebrates and fishes, supporting growth and maturation, and natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, and side channels

6) Offshore marine areas with water quality conditions and forage, including aquatic invertebrates and fishes supporting growth and maturation

Puget Sound Steelhead (*Oncorhynchus mykiss*)

Steelhead are the anadromous form of freshwater resident rainbow or redband *O. mykiss* trout species. The present distribution of steelhead extends from Asia to Alaska, and south to the U.S.-Mexico border (Busby et al. 1996; 67 FR 21586, May 1, 2002). Unlike many salmonid species, *O. mykiss* exhibits extremely complex and plastic life history characteristics, such that their offspring can exhibit different life history forms from the parental generation. For example, offspring of resident fish may migrate to sea, and offspring of anadromous steelhead may remain in streams as resident fish (Burgner et al. 1992).

Those that are anadromous can spend up to 7 years in freshwater prior to smoltification (the physiological and behavioral changes required for the transition to salt water), and then spend up to 3 years in salt water before returning to freshwater to spawn. However, they typically return to their natal stream to spawn as 4- or 5-year-old fish. Unlike Pacific salmon, steelhead trout are iteroparous, meaning they are capable of spawning more than once before they die. However, it is rare for steelhead to spawn more than twice before dying, and those that do are usually females (Busby et al. 1996).

Over their entire range, West Coast steelhead spawning migrations occur throughout the year, with seasonal peaks of migration activity varying by location. However, even in a given river basin there might be more than one seasonal migration peak, typically referred to as winter, spring, summer, or fall steelhead runs. Although there are generally four migration seasons, steelhead are typically divided into two basic reproductive ecotypes (summer and winter), based on the state of sexual maturity at the time they enter freshwater and the duration of spawning migration (Burgner et al. 1992). The summer or stream-maturing type enters fresh water in a sexually immature condition between May and October, and sexually matures in freshwater over several months. In contrast, the winter or ocean-maturing type enters fresh water in a sexually mature condition between November

and April, and spawns shortly thereafter. In basins with ecotypes, the summer run generally spawns farther upstream than winter run fish. However, the winter run of steelhead is the predominant run in Puget Sound.

Depending on water temperature, fertilized steelhead eggs may incubate in redds for 1.5 to 4 months before hatching as alevins. Following yolk sac absorption, young juveniles (fry) emerge from the gravel and begin active feeding. As they grow, steelhead move to deeper parts of the stream and establish territories and diet changes from microscopic aquatic organisms to larger organisms such as isopods, amphipods, and aquatic and terrestrial insects, primarily associated with the stream bottom (Wydoski and Whitney 1979). Riparian vegetation and submerged cover (logs, rocks, and aquatic vegetation) are important for providing cover, food, temperature stability, and protection from predators. As a result, densities of juvenile steelhead are highest in areas containing in-stream cover (Reiser and Bjornn 1979; Johnson and Kucera 1985).

Bull Trout (*Salvelinus confluentus*)

Bull trout are members of the family Salmonidae and are char native to Washington, Oregon, Idaho, Nevada, Montana, and western Canada. Compared to other salmonids, bull trout have more specific habitat requirements that appear to influence their distribution and abundance. They need cold water to survive, so they are seldom found in waters where temperatures exceed 59 to 64 degrees Fahrenheit (°F). They also require stable stream channels, clean spawning and rearing gravel, complex and diverse cover, and unblocked migratory corridors.

Bull trout exhibit a number of life history strategies. Stream-resident bull trout complete their entire life cycle in the tributary streams where they spawn and rear. Migratory bull trout spawn in tributary streams. Juvenile fish from migratory populations usually rear from 1 to 4 years in natal streams before migrating (typically downstream) to either a larger river (fluvial form) or lake (adfluvial form), where they spend their adult life, returning to the tributary stream to spawn (Fraley and Shepard 1989). These migratory forms occur in areas where conditions allow for movement from upper watershed spawning streams to larger waters that contain greater foraging opportunities (Dunham and Rieman 1999). Resident and migratory forms may be found together, and either form can produce resident or migratory offspring (Rieman and McIntyre 1993). An anadromous form of bull trout also exists in the Coastal-Puget Sound population, which spawns in rivers and streams but rears young in the ocean. Unlike strictly anadromous species, such as Pacific salmon, bull trout can also exhibit an amphidromous life form, meaning they return seasonally to fresh water as subadults, sometimes for several years, before returning to spawn (Wilson 1997; Brenkman and Corbett 2005). The amphidromous life history form of bull trout is unique to the Coastal Puget Sound population (64 FR 58921, November 1, 1999).

Bull trout have more specific habitat requirements than most other salmonids (Rieman and McIntyre 1993). Habitat components that particularly influence their distribution and abundance include water temperature, cover, channel form, spawning and rearing substrate conditions, and migration habitat (Fraley and Shepard 1989; Goetz 1989; Watson and Hillman 1997).

Watson and Hillman (1997) concluded watersheds must have specific physical characteristics to provide the necessary habitat requirements for bull trout spawning and rearing, and that these characteristics are not ubiquitous throughout the watersheds in which bull trout occur. The preferred spawning habitat of bull trout consists of low-gradient stream reaches with loose, clean gravel (Fraley and Shepard 1989). Bull trout typically spawn in a narrow time window of a couple weeks during periods of decreasing water temperatures, but spawning ranges from August to November depending on local conditions (Swanberg 1997). However, migratory forms are known to begin spawning migrations as early as April and to move upstream as much as 250 km (155 mi) to spawning areas (Fraley and Shepard 1989; Swanberg 1997).

Fraley and Shepard (1989) reported that the initiation of spawning by bull trout in the Flathead River system appeared to be related to water temperature, with spawning generally initiated when water temperatures dropped below 50°F). Goetz (1989) reported a spawning temperature range from 39°F to 50°F, but the range could be wider in some areas (Howell et al. 2010). Selection of spawning habitat by bull trout is also influenced across multiple spatial scales by hyporheic flow (Baxter and Hauer 2000), defined as a mixing of shallow groundwater and surface water beneath and lateral to a stream bed. Hyporheic flow is influenced by geomorphic complexity of the streambed and recognized to be important for surface water/groundwater interaction. Spawning areas are often associated with cold-water springs, glacial and snow melt, or groundwater upwelling (Rieman et al. 1997; Baxter et al. 1999). Fraley and Shepard (1989) also found groundwater influence and proximity to cover are important factors influencing spawning site selection. They reported the combination of relatively specific requirements resulted in a restricted spawning distribution in relation to available stream habitat. While bull trout are critically dependent on large, cold-water habitats, individuals can range widely through stream networks and use habitat that may have limited amounts of cold-water refuge (64 FR 58921, November 1, 1999).

Depending on water temperature, egg incubation is normally 100 to 145 days (Pratt 1992). Water temperatures of 34°F to 42°F have been reported for incubation, with an optimum (best embryo survivorship) temperature reported to be from 36°F to 39°F (Fraley and Shepard 1989; McPhail and Baxter 1996). Juveniles remain in the substrate after hatching. The time from egg deposition to emergence of fry can exceed 200 days. During the relatively long incubation period in the gravel, bull trout eggs and embryos are especially vulnerable to fine sediments (i.e., fine silt to coarse sand) and water quality degradation (Fraley and Shepard 1989). Increases in fine sediment appear to reduce egg survival and emergence (Pratt 1992) by restricting intragravel circulation and/or causing entombment of newly hatched alevins (young salmon that have the yolk sac still attached). Juveniles are likely also affected by reduced interstitial habitat and cover. High juvenile densities have been reported in areas characterized by a diverse cobble substrate and a low percentage of fine sediments (Shepard et al. 1984).

Habitat requirements for bull trout are listed by the U.S. Fish and Wildlife Service (USFWS) in terms of functions and PCEs. Bull trout require the following habitat functions:

1) Spawning, rearing, foraging, or over-wintering habitat to support essential existing local populations

2) Movement corridors necessary for maintaining essential migratory life history forms

3) Suitable habitat that is considered essential for recovering existing local populations that have declined or that need to be re-established to achieve recovery

These functions are provided by areas containing these PCEs:

1) Water temperatures ranging from 36°F to 59°F, with adequate thermal refugia available for temperatures at the upper end of this range. Specific temperatures within this range will vary depending on bull trout life history stage and form, geography, elevation, diurnal and seasonal variation, shade such as that provided by riparian habitat, and local groundwater influence.

2) Complex stream channels with features such as woody debris, side channels, pools, and undercut banks to provide a variety of depths, velocities, and in-stream structures.

3) Substrates of sufficient amount, size, and composition to ensure success of egg and embryo overwinter survival, fry emergence, and young-of-the-year and juvenile survival. A minimal amount of fine substrate less than 0.25 inch (0.63 centimeter) in diameter and minimal substrate embeddedness are characteristic of these conditions.

4) A natural hydrograph, including peak, high, low, and base flows within historic ranges or, if regulated, a hydrograph that demonstrates the ability to support bull trout populations by minimizing daily and day-to-day fluctuations and minimizing departures from the natural cycle of flow levels corresponding with seasonal variation.

5) Springs, seeps, groundwater sources, and subsurface water connectivity to contribute to water quality and quantity.

6) Migratory corridors with minimal physical, biological, or water quality impediments between spawning, rearing, overwintering, and foraging habitats, including intermittent or seasonal barriers induced by high water temperatures or low flows.

7) An abundant food base including terrestrial organisms of riparian origin, aquatic macroinvertebrates, and forage fish.

8) Permanent water of sufficient quantity and quality such that normal reproduction, growth, and survival are not inhibited.

9) Few or no nonnative predatory species (e.g., lake trout, walleye, northern pike, smallmouth bass); inbreeding (e.g., brook trout); or competitive (e.g., brown trout) species present.

Lake Washington provides PCEs 1, 4, 5, 6, 7, and 8 for bull trout critical habitat. Lake Washington provides a stable water body with few obstacles to fish passage and an abundant food base. Lake Washington is hydrologically connected to a network of streams, associated wetlands, and subsurface water. Water temperatures in Lake Washington are generally warmer than 15° C during the summer (King County Department of Natural Resources 2000). Non-native smallmouth bass, which are potential bull trout predators, are present in Lake Washington (WDFW 2014).

APPENDIX C

Species Lists

Status of ESA Listings & Critical Habitat Designations for West Coast Salmon & Steelhead

Puget Sound Domain

- Puget Sound Chinook (T) [FCH 9/2/05]
- Hood Canal Summer Chum (T) [FCH 9/2/05]
- Ozette Lake Sockeye (T) [FCH 9/2/05]
- Puget Sound Steelhead (T) [CH under dev.; ANPR 1/10/11]

Willamette/Lower Columbia Domain

- Columbia River Chum (T) [FCH 9/2/05]
- Lower Columbia River Coho (T) [CH Under dev.; ANPR 1/10/11]
- Lower Columbia River Chinook (T) [FCH 9/2/05]
- Lower Columbia River Steelhead (T) [FCH 9/2/05]
- Upper Willamette River Chinook (T) [FCH 9/2/05]
- Upper Willamette River Steelhead (T) [FCH 9/2/05]

Oregon Coast Domain

- Oregon Coast Coho (T) [FCH 2/11/08]

Southern Oregon/Northern California Coast Domain

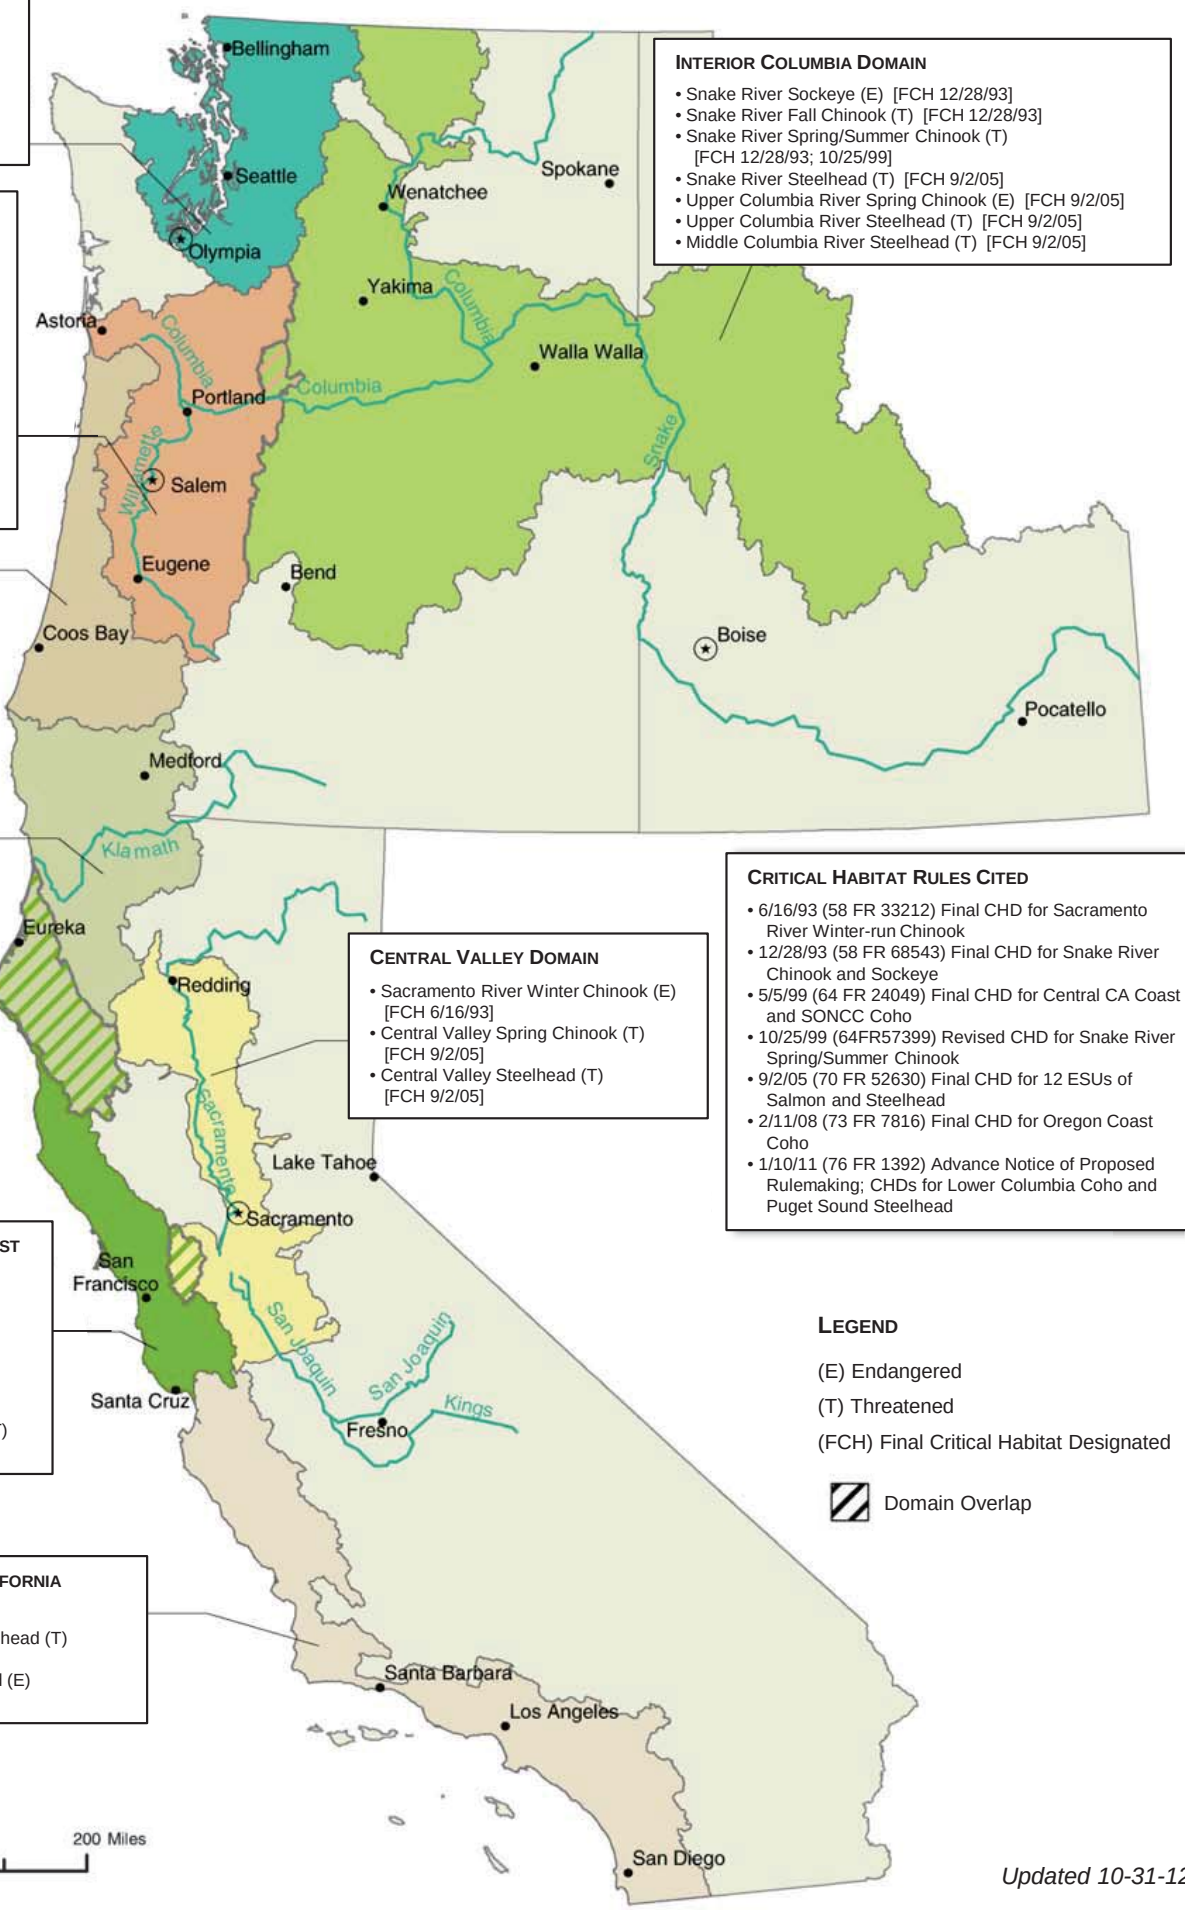
- Southern Oregon/Northern California Coast Coho (T) [FCH 5/5/99]

North-Central California Coast Domain

- Central California Coast Coho (E) [FCH 5/5/99]
- California Coastal Chinook (T) [FCH 9/2/05]
- Northern California Steelhead (T) [FCH 9/2/05]
- Central California Coast Steelhead (T) [FCH 9/2/05]

South-Central/Southern California Coast Domain

- South-Central California Coast Steelhead (T) [FCH 9/2/05]
- Southern California Coast Steelhead (E) [FCH 9/2/05]



Interior Columbia Domain

- Snake River Sockeye (E) [FCH 12/28/93]
- Snake River Fall Chinook (T) [FCH 12/28/93]
- Snake River Spring/Summer Chinook (T) [FCH 12/28/93; 10/25/99]
- Snake River Steelhead (T) [FCH 9/2/05]
- Upper Columbia River Spring Chinook (E) [FCH 9/2/05]
- Upper Columbia River Steelhead (T) [FCH 9/2/05]
- Middle Columbia River Steelhead (T) [FCH 9/2/05]

Central Valley Domain

- Sacramento River Winter Chinook (E) [FCH 6/16/93]
- Central Valley Spring Chinook (T) [FCH 9/2/05]
- Central Valley Steelhead (T) [FCH 9/2/05]

Critical Habitat Rules Cited

- 6/16/93 (58 FR 33212) Final CHD for Sacramento River Winter-run Chinook
- 12/28/93 (58 FR 68543) Final CHD for Snake River Chinook and Sockeye
- 5/5/99 (64 FR 24049) Final CHD for Central CA Coast and SONCC Coho
- 10/25/99 (64FR57399) Revised CHD for Snake River Spring/Summer Chinook
- 9/2/05 (70 FR 52630) Final CHD for 12 ESUs of Salmon and Steelhead
- 2/11/08 (73 FR 7816) Final CHD for Oregon Coast Coho
- 1/10/11 (76 FR 1392) Advance Notice of Proposed Rulemaking; CHDs for Lower Columbia Coho and Puget Sound Steelhead

LISTED AND PROPOSED ENDANGERED AND THREATENED SPECIES AND CRITICAL HABITAT; CANDIDATE SPECIES; AND SPECIES OF CONCERN
IN KING COUNTY
AS PREPARED BY
THE U.S. FISH AND WILDLIFE SERVICE
WASHINGTON FISH AND WILDLIFE OFFICE

(Revised September 3, 2013)

LISTED

Bull trout *(Salvelinus confluentus)*
Canada lynx *(Lynx canadensis)*
Gray wolf *(Canis lupus)*
Grizzly bear *(Ursus arctos = U. a. horribilis)*
Marbled murrelet *(Brachyramphus marmoratus)*
Northern spotted owl *(Strix occidentalis caurina)*

Major concerns that should be addressed in your Biological Assessment of project impacts to listed animal species include:

1. Level of use of the project area by listed species.

2. Effect of the project on listed species' primary food stocks, prey species, and foraging areas in all areas influenced by the project.

3. Impacts from project activities and implementation (e.g., increased noise levels, increased human activity and/or access, loss or degradation of habitat) that may result in disturbance to listed species and/or their avoidance of the project area.

Castilleja levisecta (golden paintbrush) [historic]

Major concerns that should be addressed in your Biological Assessment of project impacts to listed plant species include:

1. Distribution of taxon in project vicinity.

2. Disturbance (trampling, uprooting, collecting, etc.) of individual plants and loss of habitat.

1. Changes in hydrology where taxon is found.

DESIGNATED

Critical habitat for bull trout
Critical habitat for the marbled murrelet
Critical habitat for the northern spotted owl

PROPOSED

North American wolverine *(Gulo gulo luteus)* – contiguous U.S. DPS
Oregon spotted frog *(Rana pretiosa)* [historical]

CANDIDATE

Fisher *(Martes pennanti)* – West Coast DPS
Yellow-billed cuckoo *(Coccyzus americanus)*
Pinus albicaulis (whitebark pine)

SPECIES OF CONCERN

Bald eagle *(Haliaeetus leucocephalus)*
Beller's ground beetle *(Agonum belleri)*
Cascades frog *(Rana cascadae)*
Hatch's click beetle *(Eanus hatchi)*
Larch Mountain salamander *(Plethodon larselli)*
Long-eared myotis *(Myotis evotis)*
Long-legged myotis *(Myotis volans)*
Northern goshawk *(Accipiter gentilis)*
Northern sea otter *(Enhydra lutris kenyoni)*
Northwestern pond turtle *(Emys (= Clemmys) marmorata marmorata)*
Olive-sided flycatcher *(Contopus cooperi)*
Pacific lamprey *(Lampetra tridentata)*
Pacific Townsend's big-eared bat *(Corynorhinus townsendii townsendii)*
Peregrine falcon *(Falco peregrinus)*
River lamprey *(Lampetra ayresi)*
Tailed frog *(Ascaphus truei)*
Valley silverspot *(Speyeria zerene bremeri)*
Western toad *(Bufo boreas)*
Aster curtus (white-top aster)
Botrychium pedunculosum (stalked moonwort)
Cimicifuga elata (tall bugbane)

LISTED AND PROPOSED ENDANGERED AND THREATENED SPECIES AND CRITICAL HABITAT; CANDIDATE SPECIES; AND SPECIES OF CONCERN IN SNOHOMISH COUNTY AS PREPARED BY THE U.S. FISH AND WILDLIFE SERVICE WASHINGTON FISH AND WILDLIFE OFFICE

(Revised September 3, 2013)

LISTED

Bull trout (*Salvelinus confluentus*)
Canada lynx (*Lynx canadensis*)
Gray wolf (*Canis lupus*)
Grizzly bear (*Ursus arctos* = *U. a. horribilis*)
Marbled murrelet (*Brachyramphus marmoratus*)
Northern spotted owl (*Strix occidentalis caurina*)

Major concerns that should be addressed in your Biological Assessment of project impacts to listed species include:

1. Level of use of the project area by listed species.

2. Effect of the project on listed species' primary food stocks, prey species, and foraging areas in all areas influenced by the project.

3. Impacts from project activities and implementation (e.g., increased noise levels, increased human activity and/or access, loss or degradation of habitat) that may result in disturbance to listed species and/or their avoidance of the project area.

DESIGNATED

Critical habitat for bull trout
Critical habitat for the marbled murrelet
Critical habitat for the northern spotted owl

PROPOSED

North American wolverine *(Gulo gulo luteus)* – contiguous U.S. DPS
Oregon spotted frog (*Rana pretiosa*) [historical]

CANDIDATE

Fisher *(Martes pennanti)* – West Coast DPS
Yellow-billed cuckoo (*Coccyzus americanus*)
Pinus albicaulis (whitebark pine)

SPECIES OF CONCERN

Bald eagle (*Haliaeetus leucocephalus*)
Beller's ground beetle (*Agonum belleri*)
Cascades frog (*Rana cascadae*)
Long-eared myotis (*Myotis evotis*)
Long-legged myotis (*Myotis volans*)
Northern goshawk (*Accipiter gentilis*)
Olive-sided flycatcher (*Contopus cooperi*)
Pacific lamprey (*Lampetra tridentata*)
Pacific Townsend's big-eared bat (*Corynorhinus townsendii townsendii*)
Peregrine falcon (*Falco peregrinus*)
River lamprey (*Lampetra ayresi*)
Tailed frog (*Ascaphus truei*)
Western toad (*Bufo boreas*)
Botrychium pedunculosum (stalked moonwort)

APPENDIX D

Stormwater Analysis Memorandum

DETAILED STORMWATER ANALYSIS

This appendix presents the results of modeling conducted to support the analysis of stormwater-related impacts of the Lynnwood Link Extension. As requested by NMFS staff during pre-consultation meetings for this BA, the WSDOT Highway Runoff and Dilution Loading (HI-RUN) model was used to generate estimates of current and anticipated future loadings and concentrations of dissolved copper and dissolved zinc in runoff from the Lynnwood Link Extension. This appendix also presents additional information about the path traveled by water after it leaves proposed stormwater treatment facilities, the traffic volumes on roadways that will be new PGIS, and the sources of existing stormwater runoff in the analysis area.

Table D-1 on the following page presents detailed information about the areas of new PGIS that will result from the Lynnwood Link Extension, including estimates of the average daily number of vehicles on each roadway or parking area. The table also describes the path traveled by water discharged from the facilities that Sound Transit proposes creating to provide water quality treatment for the runoff from new areas of PGIS.

Consistent with the requirements of the Washington Department of Transportation's Highway Runoff Manual, threshold discharge areas (TDAs) were delineated in the analysis area. Four of these TDAs have outfalls to streams (Thornton Creek and McAleer Creek) at locations where ESA-listed species may be present (Table D-1).

In all TDAs, runoff from PGIS that will be created or removed by the Lynnwood Link Extension will comingle with runoff from numerous other sources. The greatest contributor is I-5, which has traffic volumes of approximately 150,000 to 200,000 vehicles per day in the analysis area. In contrast, more than 95 percent of the new PGIS created by the project will be used by 10,000 or fewer vehicles per day (Table D-1).

Treated water discharged from TDA 7 North and from the NE 130th Street overpass in TDA 3 will travel a substantial distance (between 1,500 and 2,600 feet) through vegetated ditches before entering any fish-bearing waters. Concentrations of dissolved metals traveling in ditches will be reduced through uptake by vegetation growing in the ditches and through chemical reactions with negative ions in the soils that support the vegetation.

Treated water discharged from TDA 4 and from portions of TDA 3 other than the NE 130th Street overpass will travel primarily through pipes before entering Thornton Creek. Notably, these outfalls discharge more than 3,000 feet upstream of any reaches where ESA-listed species are known or expected to be present. As a result, runoff discharged from those areas is highly unlikely to affect ESA-listed species.

Table D-1. Acreage and Approximate Traffic Volumes on PGIS Areas To Be Added by the Lynnwood Link Extension, and the Routes Traveled by Water Discharged from New Stormwater Treatment Facilities

PGIS Source	Traffic Volume [1]	PGIS Area (acres)	Post-treatment Path
TDA 3			
NE 130th	20,000	0.28	Water leaving the facility will flow approximately 2,600 feet through vegetated ditches along the west side of I-5 before entering a culvert under the freeway, joining Thornton Creek approximately 1,700 feet upstream of where steelhead are known or expected to be present. (Sub-basin 1)
NE 145th Station Parking	500	0.33	Water leaving the facility will enter an existing pipe that discharges to Thornton Creek approximately 3,000 feet upstream of where steelhead are known or expected to be present. (Sub-basin 2)
I-5 onramp	10,000	0.26	Water leaving the facility will enter an existing enclosed pipe system that discharges to the culverts containing Thornton Creek approximately 3,500 feet upstream of where steelhead are known or expected to be present. (Sub-basin 3)
NE 148th	100	0.08	As above (Sub-basin 3)
NE 145th Station Parking	500	0.64	As above (Sub-basin 3)
TDA 4			
1st Ave NE	500	0.21	Water leaving the facility will flow approximately 1,500 feet, mostly in pipes, before entering Thornton Creek approximately 1 mile upstream of where steelhead are known or expected to be present.
TDA 7 South			
5th Ave NE east of I-5	3,000	0.33	Water leaving the facility will flow approximately 4,900 feet, mostly in pipes, before entering McAleer Creek where steelhead and Chinook salmon may be present; the nearest spawning habitat (for Chinook salmon only) is approximately 1 mile downstream.
Parking	500	0.74	As above
5th Ave NE west of I-5	2,000	0.59	As above
Bus Turnaround	300	0.79	Infiltration facility (emergency overflow will follow the path described above)
TDA 7 North			
Southbound I-5 onramp at 220th Street	8,000	0.40	Water leaving the facility will flow approximately 7,000 feet, including approximately 1,500 feet in vegetated ditches, before entering a vegetated stormwater detention pond at the I-5/SR 104 interchange. Water from the pond discharges onto a riprap pad then flows at surface approximately 100 feet before joining McAleer Creek where steelhead salmon may be present but approximately 1,600 feet upstream of where Chinook salmon are known or expected to occur.

[1] Average annual daily traffic, vehicles per day

Treated water discharged from TDA 7 South will travel primarily through pipes before entering McAleer Creek, limiting opportunities for infiltration and other types of incidental improvements to water quality between the treatment facilities and fish-bearing waters.

Because most of the stormwater runoff from PGIS in the project area comes from sources other than the Lynnwood Link Extension, NMFS suggested that Sound Transit employ a "pipe-within-a-pipe" approach when using the HI-RUN model to analyze project-related stormwater impacts. This approach assumes that stormwater from the new PGIS resulting from the Lynnwood Link Extension will not combine with water from other sources before reaching the discharge point. In other words, the pipe-within-a-pipe approach recognizes the need to consider the project's contribution to water quality independently of the much greater contribution of contaminants from I-5 and other sources. The results of these model runs are presented on the following pages and summarized below.

The model results using this approach show that pollutant loading in TDAs 3, 4, and 7 North will decrease compared to current conditions. This conclusion is based on the P(exceed) values generated by the model (WSDOT 2008). P(exceed) values less than 0.50 represent conditions under which runoff quality is expected to improve. Given the inherent uncertainty and variability in the data, a P(exceed) threshold value of 0.45 was selected to provide a level of confidence that proposed conditions would not be degraded when compared to background conditions (WSDOT 2008). The P(exceed) values for dissolved copper in these three TDAs range from 0.00 to 0.34 and the values for dissolved zinc range from 0.00 to 0.25. These results are consistent with expectations based on the combined effects of treating all new PGIS and removing some areas of existing PGIS in these TDAs, and of treating an additional 0.83 acre of existing PGIS in TDA 3, sub-basin 1.

In TDA 7 South, the HI-RUN model results indicate the potential for increased pollutant loadings, with P(exceed) values of 0.74 and 0.61 for dissolved copper and dissolved zinc, respectively, necessitating the use of the dilution subroutine for a closer look at the potential for adverse effects on ESA-listed fish. The output of the dilution subroutine presents a conservative distance (mixing zone) downstream of the outfall, where there is a 5 percent chance that pollutant concentrations will exceed thresholds for effects on fish. The established thresholds are based on potential increases of 2.0 μg/L above background concentrations of dissolved copper and 5.6 μg/L above background concentrations dissolved zinc.

The dilution subroutine showed mixing zone distances less than 1 foot under both baseline and proposed conditions, indicating a minimal risk of adverse effects. During the November 19, 2014, meeting with representatives of Sound Transit and FTA, NMFS noted that modeled mixing zone distances less than 5 to 10 feet are typically considered to be consistent with an effects determination of "not likely to adversely affect."

Based on these results, the potential for stormwater runoff from the Lynnwood Link Extension to result in adverse effects on ESA-listed fish will be insignificant and discountable. The model results support the determination in the draft biological assessment that construction and operation of the Lynnwood Link Extension may affect but is not likely to adversely affect Puget Sound Chinook salmon and Puget Sound steelhead.

1 INTRODUCTION

1.1 Background

Sound Transit is preparing to extend mass transit from Northgate to Lynnwood, which voters approved as part of the Sound Transit 2 Plan in 2008, along with funding to continue planning future service all the way to Everett. The project, called the North Corridor Transit Project (NCTP), will connect to and build on the Link light rail line that opened for service between downtown Seattle and Sea-Tac Airport in 2009.

Sound Transit has just completed an Alternative Analysis (AA) in compliance with Federal Transit Administration guidelines for New Starts grant funding. The AA, entitled the "NCTP Alternatives Analysis Report and SEPA Addendum" (Sept 2011), evaluated a range of potential alternatives for addressing mobility needs within the Project area, including transit modes, routes, stations, and operating features.

The AA concluded that light rail was the only mode that can satisfy the NCTP's Purpose and Need related to transportation effectiveness in meeting the corridor's mobility, access, and capacity needs, as well as consistency with Sound Transit's Long-Range Plan. Interstate 5 (I-5) was one of the corridors evaluated by the AA for light rail service. The proposed I-5 alternative is shown in Figure 1.

The next step for the project is to begin the conceptual design and environmental review activities associated with the NEPA/SEPA Draft Environmental Impact Statement (DEIS). This process will more closely define the footprint requirements for light rail infrastructure and will identify potential impacts associated with alternative alignments.

1.2 Purpose of Report

This report was prepared by North Corridor Transit Partners for the Washington State Department of Transportation (WSDOT) and Sound Transit (Central Puget Sound Regional Transit Authority). This report documents WSDOT and Sound Transit's agreement on reasonable I-5 highway and light rail areas that will ensure WSDOT's ability to make future highway improvements while accommodating light rail infrastructure and minimizing impacts to adjacent properties. This report documents WSDOT's and Sound Transit's assumptions for beginning the design process of light rail alternatives along I-5.

1.3 Approach

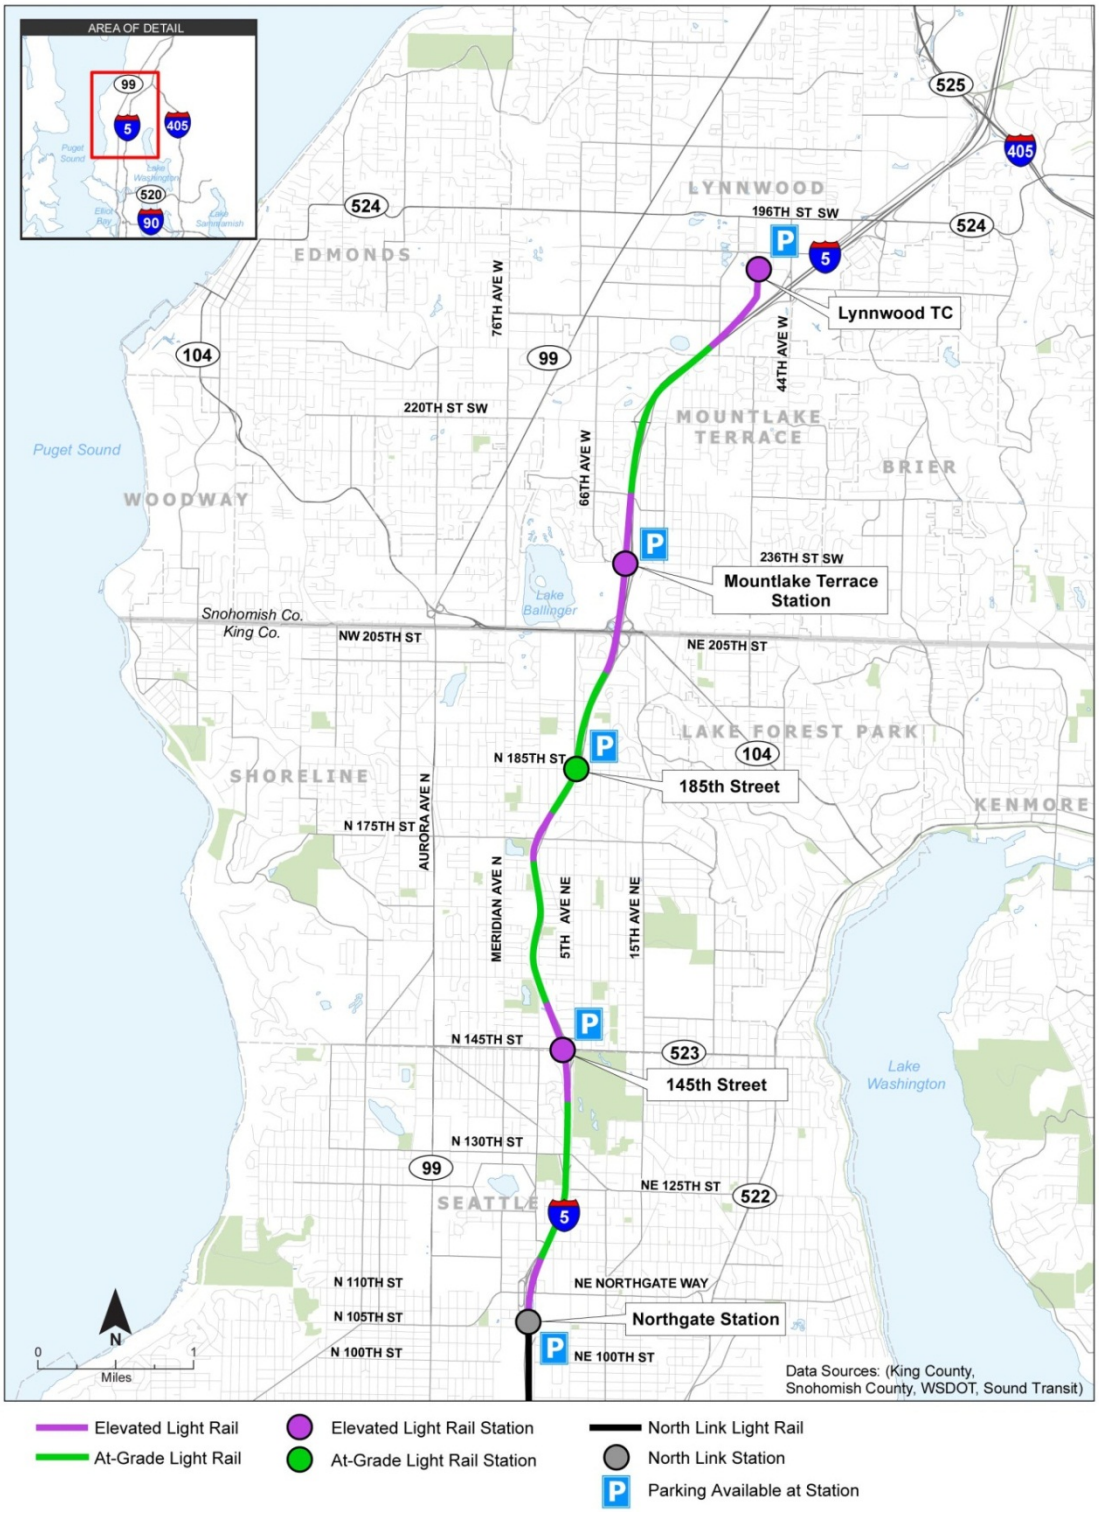
The analysis for this report takes into account previous studies prepared by WSDOT and Sound Transit. WSDOT studies include the I-5 Pavement Replacement Project and the Express Toll Lanes Study. The Pavement Reconstruction Project (Existing Pavement Conditions and Traffic Operations Analysis Results Report, November 2007) identified several operational improvements that included creating four continuous lanes between the Washington Ship Canal Bridge and the northern terminus of the express lanes. The Express Toll Lanes Study, currently in progress, is analyzing the conversion of the existing HOV lane and possible addition of a new lane north of the express lanes that could be available for a tolled lane system.

The Sound Transit Alternatives Analysis Report (September 2011) for the light rail extension from Northgate to Lynnwood identifies the east side of I-5 up to SW 236th Street and the median from SW 236th Street to Lynnwood as a likely location for light rail. For that reason, this report is limited to reviewing the northbound (east side) portion of I-5. This report could be amended in the future if an analysis of the southbound portion of I-5 is determined necessary. Additional details will be developed during the DEIS process to further define issues that are beyond the scope of this report's analysis.

WSDOT's I-5 highway requirements for the I-5 right-of-way include the need for space adjacent to the existing travel lanes to maintain the flexibility for future improvements to the highway infrastructure such as improving safety, upgrading environmental conditions, improving highway technology (ITS), and/or adding capacity.

Sound Transit's needs for light rail include providing adequate space for the rail guideway infrastructure for each direction of travel, a pedestrian walkway, poles to support the overhead catenary system, signal systems, bridge railing, noise walls, and retaining walls. For the NCTP DEIS analysis, the light rail footprint will be located outside of the highway area. The DEIS will evaluate the width and location requirements of the proposed rail alignments, including construction impacts outside of the highway area.

The concepts presented in the following analysis identify a range of possible improvements that support WSDOT's and Sound Transit's interests and do not represent a specific approved or proposed project. These concepts provide a basis to identify a reasonable space allocation that will be flexible for WSDOT to make future highway improvements that would not require relocation of the light rail infrastructure.



Depicted is one of several alternative concepts for light rail service on the I-5 corridor, additional alignment and station alternatives will be considered in the DEIS, but those have not been defined in detail at this time.

Figure 1. NCTP Conceptual I-5 Corridor for Light Rail Service

2 EXISTING ROADWAY CONDITIONS

In addition to the existing mainline general purpose lanes, HOV lanes and interchanges, the I-5 corridor includes infrastructure to support traffic operations, bus operations, safety and environmental requirements.

Within the corridor, infrastructure to support buses includes outside freeway stops and a park-and-ride lot at NE 145th Street, a transit only interchange to King County Metro's North Base, a transit only median freeway station at Mountlake Terrace, and an HOV median direct access ramp system in Lynnwood. Transit also benefits from the high-occupancy vehicle (HOV) lanes located throughout the I-5 corridor. Figure 2 illustrates the existing lane and ramp configuration of I-5 from Northgate to Lynnwood.

Additional highway infrastructure supports safety and operations along the corridor. This infrastructure includes barriers, guardrails, retaining walls, noise walls, drainage piping systems, stormwater treatment and detention, signs, illumination, and intelligent transportation systems (ITS). ITS includes features such as traffic cameras, vehicle data collectors, variable message signs, ramp meters and signals and fiber optic cables, as well as associated electrical cabinets and junction boxes. Landscaping and natural vegetation buffers, although not a specific highway function, are typically important features to communities to provide separation between the highway lanes and the private properties. All of these features occupy additional space beyond the edge of pavement to provide the existing and future functions.

Existing features also use some of the space within the existing right of way. At several locations, local streets were constructed within the I-5 right of way or are located adjacent to the right of way. The terrain has constant variation throughout the project limits and in many cases these slopes and retaining walls take up much of the space between the existing highway pavement and the edge of the I-5 right-of-way.

Existing right-of-way varies along the entire length of this corridor. The greatest variability occurs through the interchanges where additional width is required for the ramps. Between ramps, there is also variability due to the original property boundary lines that existed prior to construction of I-5 and the land purchases that were negotiated to create the I-5 right-of-way. As a result, the right-of-way width is rarely constant along this project corridor. To summarize the right-of-way widths, Table 1 describes the variability in the right-of-way width along mainline I-5 measured approximately from the existing center barrier to the eastern edge of the right-of-way, The data in Table 1 is segmented from one interchange to the next, but does not include the additional width at each interchange to accommodate ramps.

Table 1*. Existing I-5 Northbound Roadway Right-of-Way

Segment	Eastern Half ROW width
Northgate Way to 130th	125-220 feet
130th to 145th	215-220 feet
145th to North Base	125-150 feet
North Base to 175th	120-185 feet
175th to 205th (County Line)	135-220 feet
205th to 236th	185-350 feet
236th to 220th	125-320 feet
220th to 44th	130-210 feet

*The data in Table 1 is segmented from one interchange to the next, and does not include the additional width required at each interchange to accommodate ramps.

3 FUTURE ROADWAY NEEDS

3.1 Maintaining Flexibility for Future Decisions

WSDOT has studied a number of possible modifications to the I-5 corridor between Northgate and Lynnwood but has not adopted specific plans for improvements. As noted previously, space within the I-5 right-of-way and adjacent to the existing travel lanes needs to be reserved to maintain the flexibility for future improvements to the highway infrastructure such as improving safety, upgrading environmental conditions, improving highway technology (ITS), or adding capacity. These improvements could include the following:

- Upgrade existing shoulders and maintain existing 12-foot lanes to meet current design standards,
- Create additional capacity by adding lanes,
- Modify interchanges,
- Upgrade ITS systems (variable speed limits, cameras, tolls, illumination, etc.),
- Update drainage infrastructure to meet current or future stormwater standards,
- Provide additional noise mitigation, and
- Provide additional landscaping buffers and enhancements.

The highway area is based on the ability to add one extra lane from the express lane ramps at Northgate to I-405. The additional lane could be added as an additional general purpose lane, an HOV lane, or as a hard shoulder running lane. Figure 2 shows the existing lane configuration and the future concept of how one additional lane could be added to the corridor. Lane continuity (providing continuous lanes for as long as possible) was also a factor in developing the future concept and as a result the future lane concept includes two additional lanes at the 175th interchange. In summary, the future concept could have six continuous lanes between the north end of the express lanes and the county line at the 205th Street interchange, then five continuous lanes north of the county line.

3.2 Northbound Roadway Cross Sections

Space allocations for potential roadway modifications were evaluated using a series of cross sections for variable quantity of lanes and widths of lanes. Figure 3 shows the existing cross section and four potential options for widening the cross section with additional lanes or widened shoulders. Each option shows the same 84-foot total width cross section, the variability of the lane, shoulder, and buffer widths and the resulting quantity of lanes possible for each option. The table on the right side of the figure shows the total cross section width as a result of varying the quantity of lanes. The four options studied are as follows:

- Option 1- 7 lanes: Minimum widths for lanes and shoulders.

- Option 2 – 6 lanes: Hard Shoulder Running (HSR) option with larger left shoulder and a peak period HSR lane on the right shoulder.
- Option 3 – 6 lanes: Dual Express Lane option with narrower left shoulder and full right shoulder, and narrower lanes.
- Option 4 – 5 lanes: Full Standards option that includes the maximum lane, shoulder, and buffer widths.

Since specific future freeway improvements have not been identified, it is important to define a pavement envelope that will provide reasonable flexibility for a variety of future options. After careful review and analysis of a variety of cross-section options, WSDOT and Sound Transit concluded that a pavement width of 84 feet from the center barrier to the edge of the roadway will provide the desired flexibility. This width allows for future lane configurations that could range between five and seven lanes. With the exception of areas around the freeway interchanges, an 84-foot pavement width for mainline lanes is adequate to provide the desired flexibility along the entire length of the North Corridor Transit Project.

Additional space outside of the pavement may be required for other safety, environmental, and technology highway elements. Space beyond the pavement is required for barriers or guardrails, signs, illumination, ITS infrastructure, fencing, and retaining walls. In general, a 10-foot width on the outside edge of the mainline is recommended for these elements. Where light rail might be located in the median of I-5, specific elements would need to be designed into the light rail infrastructure, which could include barriers, walls, drainage collection, and structure support columns. At isolated locations, the 10-foot space could be reduced or a light rail guideway column could be located within this area if additional design studies provide documentation that the space is not required for highway uses.

Figure 3. Future Potential Northbound I-5 Roadway Cross Sections

3.3 Interchanges

While an 84-foot roadway width between interchanges is adequate to maintain WSDOT's flexibility to make a range of future freeway improvements, each interchange between Northgate and Lynnwood needs to be evaluated individually to determine the highway area needed for potential mainline lane additions and for potential modifications to the interchange ramps. To accommodate mainline lane additions, further evaluation of the tapers and gore areas is required to define how existing interchanges could be connected to the wider mainline. This area is variable for each ramp at each interchange. WSDOT and Sound Transit will continue to define the space allocation for the I-5 ramps.

At each interchange, space should be preserved for cross-street widening that could include bicycle and pedestrian improvements and safety elements such as clear zone and sight distance. In general along this corridor, interchange ramp terminals are separated from the mainline by slopes and vegetation. If mainline lanes are widened, it is assumed that the widening would occur within the vegetated area and interchange ramp terminals would not be affected. WSDOT may undertake interchange modifications in the future at NE 130th and NE 145th Streets but a specific configuration has not been determined at this time. WSDOT and Sound Transit will work together during Sound Transit's North Corridor Transit Project DEIS process to further define thehighway area at these two interchanges or define the modifications needed as a result of impacts from the light rail project. Where ramps are parallel and adjacent to mainline lanes, the reservation area includes space for relocation of the ramps outside the northbound mainline 84-foot width.

Each interchange has been reviewed to identify potential issues that could require modifications and therefore require a reservation for improvements. Each interchange is outlined in the sections that follow with a list of issues that could be considered at each interchange.

3.3.1 NE Northgate Way Interchange

- Southbound collector/distributor ramp weaving and capacity issues may be addressed in the future by WSDOT. The southbound ramp is outside the assumed alignment for light rail.
- Preserve the ability to enhance existing pedestrian and bicycle treatments along the local street.

Figure 4. Northgate Way Interchange

3.3.2 NE 130th Street Interchange

- Northbound ramp intersection configuration at 5th Avenue is not a typical interchange layout and could be considered for eventual modification by WSDOT.
- Roosevelt Way/130th Street/5th Avenue intersection configuration does not meet current standards for intersection alignments due to the curve on the east leg of the intersection.
- Preserve the ability to enhance existing pedestrian and bicycle treatments along the local street.
- Completing the interchange by adding southbound off and northbound on ramps is not under consideration.

Figure 5. NE 130th Street Interchange

3.3.3 NE 145th Street Interchange

- Northbound ramp intersection configuration at 5th Avenue is not a typical interchange layout and could be considered for modifications.
- 145th Street/5th Avenue intersection capacity should be evaluated with the addition of a light rail station and park and ride. Intersection modifications may be necessary to improve the capacity for the potential increase in traffic.
- Preserve the ability to enhance existing pedestrian and bicycle treatments along the local street.
- Existing bus transit freeway stops will be removed once light rail service is in operation.
- WSDOT may consider adding HOV/ETL direct access ramps within this interchange.

Figure 6. NE 145th Street Interchange

3.3.4 Metro North Base Interchange

- No future changes identified.

Figure 7. Metro North Base interchange

3.3.5 NE 175th Street Interchange

- Preserve the ability to enhance existing pedestrian and bicycle treatments along the local street.

Figure 8. NE 175th Street Interchange

3.3.6 SR 104 (NE 205th Street) Interchange

- Preservation of open space for potential stormwater or wetland mitigation is desirable.
- WSDOT may consider adding HOV/ETL direct access ramps within this interchange.

Figure 9. SR 104 (NE 205th Street) Interchange

3.3.7 236th Street SW Interchange

- Preserve the ability to enhance existing pedestrian and bicycle treatments along the local street.
- Completion of interchange by adding southbound off and northbound on ramps is not under consideration.

Figure 10. 236th Street SW Interchange

3.3.8 220th Street SW Interchange

- Potential for intersection widening to improve the intersection level of service.
- Potential addition of southbound mainline auxiliary lane between 44th and 220th Streets.

Figure 11. 220th Street SW interchange

3.3.9 Lynnwood Transit Center Direct Access Ramp/44th Avenue W Interchange

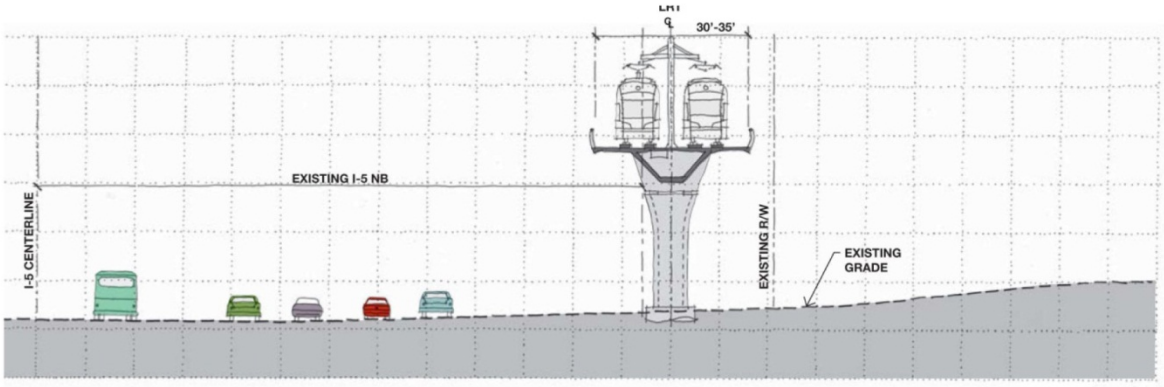
- Southbound on-ramp from 44th Avenue W is configured for high vehicle speeds and makes non-motorized travel through the intersection along the south side of 44th difficult. Modified intersection geometry could be considered by WSDOT.

Figure 12. 44th Avenue W Interchange and Lynnwood Transit Center Direct Access Ramp

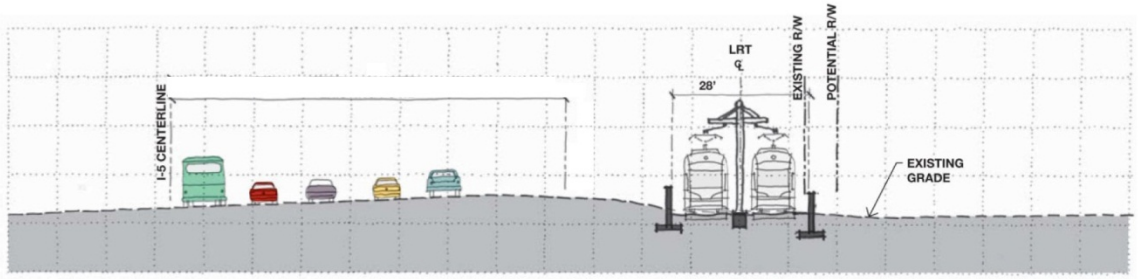
4 LIGHT RAIL AREA

Light rail will extend from the planned Northgate Link light rail station to the existing Transit Center in Lynnwood. Sound Transit's recent North Corridor alternatives analysis process identified the east side of I-5, from Northgate to SW 236th Street in Snohomish County and then the median from SW 236th Street to the Lynnwood Transit Center as a promising general location for a light rail alignment. Additional alignment and station alternatives will be considered in the DEIS, but those have not been defined in detail at this time.

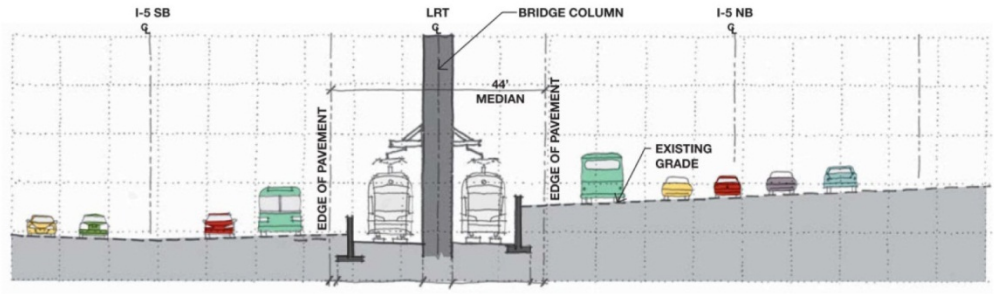
Critical space elements for the light rail include the rail guideway infrastructure for each direction of travel, a pedestrian walkway along the guideway for emergency and maintenance use, poles to support the overhead catenary system, signal systems, drainage systems, bridge railing, noise walls, and retaining walls. Widths to accommodate these elements range between 28 and 35 feet, except in the median of I-5 up to 44-feet may be needed where columns support structures over I-5. Figure 13 illustrates potential cross-section configurations for light rail along the I-5 corridor. In many locations additional space may be required for light rail retaining walls, fencing, noise walls, or relocating freeway infrastructure. The light rail alignment cannot always be located parallel to the edge of the highway due to light rail geometric requirements or other design conflicts; therefore there could be additional space between the highway area and the light rail area. Existing highway noise walls may also need to be relocated nearer the right-of-way line to provide noise abatement for both light rail and highway noises.



TYPICAL CROSS-SECTION OF ELEVATED RAIL ON EAST SIDE OF ROADWAY



TYPICAL CROSS-SECTION OF AT-GRADE RAIL ON EAST SIDE OF ROADWAY



TYPICAL CROSS-SECTION OF AT-GRADE RAIL IN MEDIAN OF ROADWAY

The light rail alignment cannot always be located parallel to the edge of the highway due to light rail geometric requirements; therefore there could be additional space between the WSDOT pavement reservation and the light rail reservation.

Figure 13. Typical Light Rail Cross Sections

5 CONCLUSIONS AND NEXT STEPS

The next step for the North Corridor Transit Project is to begin the conceptual design activities associated with the NEPA/SEPA Draft Environmental Impact Statement (DEIS). This process will more closely define the footprint of the light rail infrastructure and the identification of impacts associated with the project. The footprint will be developed to preserve space for future modifications of I-5 and will provide the I-5 areas described above. In summary, the assumptions that WSDOT and Sound Transit have agreed to are as follows and as shown in Figure 14:

- For the mainline I-5 northbound roadway, provide 84 feet pavement area for future pavement width from center barrier to the edge of I-5 mainline.
- North of 236th Street SW, where I-5 includes a median between the northbound and southbound roadways, sufficient right of way exists to provide the 84 foot pavement area on the outside of the existing highway without encroaching into the median. For this segment, it is contemplated that the light rail infrastructure would be built in the median of I-5.
- Provide an additional 10 feet beyond the outside edge of the roadway to accommodate barriers, ITS, signals, etc. This area could potentially be used for light rail guideway columns.
- Interchange gore area needed to support an additional lane should be defined during the DEIS design development process.
- Additional modifications may be considered by WSDOT and Sound Transit during the DEIS design development. The following locations are currently identified for additional design coordination:
    - 117th/1st Avenue NE
    - 130th interchange
    - 145th interchange
    - Lynnwood Transit Center (direct access and 44th on-ramp vicinity)
- Cross-street improvements may also occur in the future and therefore LRT guideway columns, abutments, etc. should be located away from the existing edge of streets. Specific structure locations will be defined during the final design phase and coordinated with the appropriate jurisdiction.
- Light Rail will be placed outside the minimum highway area and the specific location will vary based on meeting the Sound Transit Design Criteria Manual and project needs.

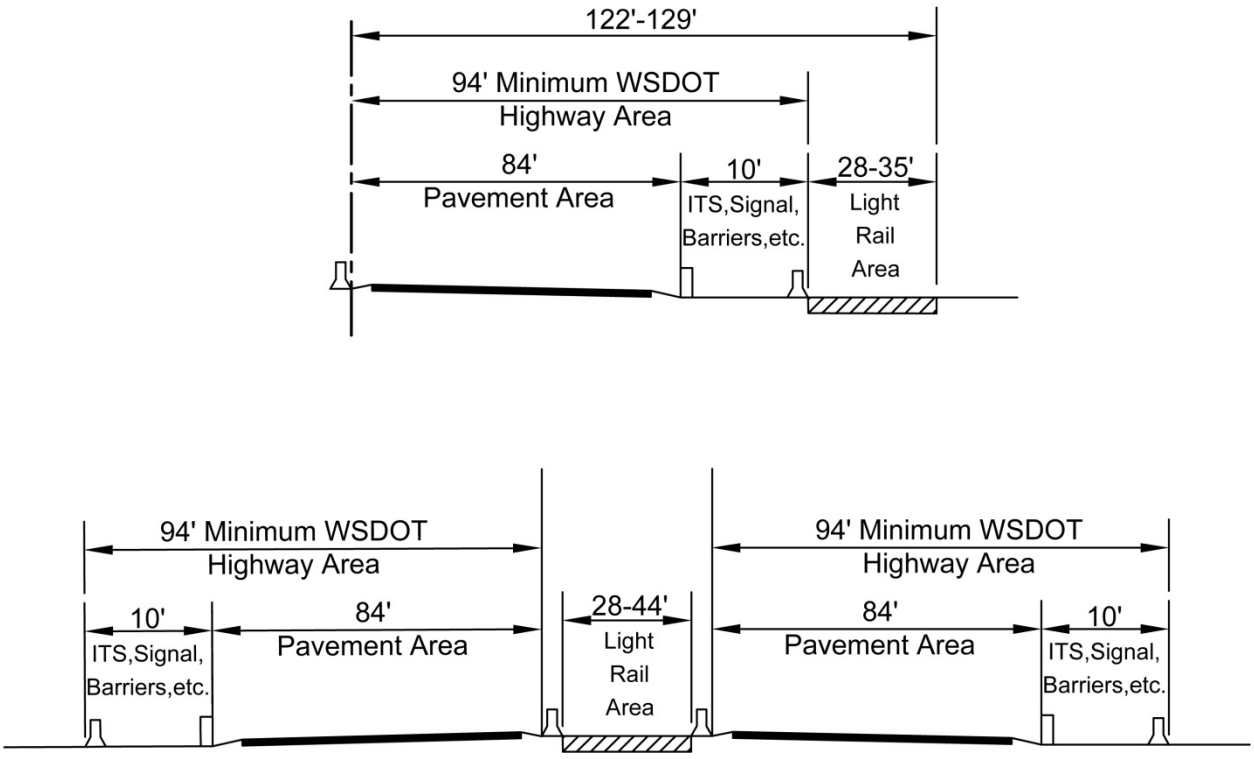


Figure 14. Minimum Highway and Light Rail Areas

Appendix R

Link Operations and Maintenance Satellite Facility Analysis

APPENDIX R – LINK OPERATIONS AND MAINTENANCE SATELLITE FACILITY ANALYSIS

As described in Chapter 2, Sound Transit plans to construct and operate a Link Operations and Maintenance Satellite Facility (OMSF) to support light rail operations and maintenance needs for the ST2 program of projects across the Sound Transit district. Sound Transit and FTA issued a separate NEPA/SEPA Draft EIS for this facility in May 2014 and are now preparing its Final EIS. The new OMSF would operate in conjunction with Sound Transit's existing Forest Street Operations and Maintenance Facility (OMF) in Seattle to support the 80 additional light rail vehicles required for ST2's expanded system.

The OMSF Draft EIS evaluated one alternative in Lynnwood and three alternatives in Bellevue (see Figure R-1):

Lynnwood Alternative—This alternative is north of I-5, west of the Lynnwood Transit Center, and east of 52nd Avenue West/Cedar Valley Road, with additional light rail storage tracks, operator report facilities, and interior cleaning functions in Bellevue north of NE 12th Street and south of SR 520.

BNSF Alternative—This alternative is located in Bellevue between the Eastside Rail Corridor on the west and 120th Avenue NE on the east, south of SR 520 and north of NE 12th Street.

BNSF Modified Alternative—This alternative would be in the same location as the BNSF Alternative, but it would construct the OMSF on both sides of the Eastside Rail Corridor west of 120th Avenue NE.

SR 520 Alternative—This alternative would be constructed south of SR 520 and north of Northup Way/NE 20th Street, east of 130th Avenue NE and west of 140th Avenue NE.

On July 24, 2014, the Sound Transit Board identified the BNSF Alternative as the Preferred Alternative for evaluation in the final EIS along with other alternatives (Motion M2014-51). A final decision on the OMSF site will be made after publication of the project's Final EIS, expected in summer 2015. Table R-1 summarizes the potential impacts of the OMSF build alternatives.

OMSF Draft EIS

Table R-1. Differentiating Characteristics and Impacts of the OMSF Build Alternatives

Differentiating Characteristic	Lynnwood Alternative	BNSF Alternative	BNSF Modified Alternative	SR 520 Alternative
Operations				
Requires off-site storage tracks	Yes	No	No	No
Acquisitions, Displacements, and Relocations				
Number of parcels acquired	14–15	6	14	13
Number of existing land uses displaced	11–14	14	25	101
Land Use				
Consistent with zoning/comprehensive plan designations	No; would require comp. plan and zoning change and a conditional use permit.	No; would require a conditional use permit.	No; would require a conditional use permit.	No; would require a conditional use permit.
Surplus land available for redevelopment	9–13 acres	4 acres	8 acres	0 acres
Economics				
Loss of annual property tax revenue (2012)	$413,100–$450,400	$464,200	$572,400	$630,500
Noise and Vibration				
Affected sensitive receptors and adjacent land uses (number after mitigation)	2 homes (None)	None	None	None
Ecosystems and Water Resources				
Aquatic impacts	≤ 0.1 acre of stream buffer	0 acres of stream buffer	0 acres of stream buffer	Piping approx. 700 feet of Goff Creek and 0.64 acre of stream buffer
Vegetation and wildlife impacts (vegetation removal)	11–12 acres	3 acres	6 acres	2 acres
Wetland impacts (direct)	1.98–2.18 acres	0.07 acre	0.6 acre	0.39 acre
Wetland buffer impacts	1.79 acres	0.25 acre	1.33 acres	0.29 acre
Groundwater and stream baseflow impacts	No	No	No	Yes
Public Services				
Number of direct impacts on essential public facilities	1	0	1	0
Parkland and Open Space				
Number of temporary impacts on park resources	1	0	0	0

Link Light Rail Operations and Maintenance Satellite Facility Draft Environmental Impact Statement, May 2014

This Lynnwood Link Extension EIS analysis assumes the OMSF along with other ST2 projects as part of the No Build and all build alternatives. Even if the Lynnwood Link Extension does not go forward, Sound Transit will construct the OMSF to accommodate other elements of the ST2 Plan.

Sound Transit does not require the OMSF in order to build and operate the Lynnwood Link Extension, although the OMSF is needed to operate Lynnwood Link at the level of light rail service assumed for the ST2 program. If the OMSF is delayed or not constructed, Link operation and maintenance would occur exclusively at the Forest Street OMF. Therefore, Lynnwood Link Extension and the Link OMSF are related but have independent utility under NEPA and SEPA.

However, Lynnwood Link Extension service levels without the OMSF would be substantially lower than if the OMSF were constructed. During peak periods, the OMSF will enable four-car trains at 4-minute headways between the Lynnwood Transit Center and International District Station in Seattle. Without the OMSF, the Lynnwood Link Extension would run three-car trains and have longer peak-hour headways, reducing passenger capacity by more than 40 percent. Table R-2 compares potential effects of the Lynnwood Link Extension project with the service levels assumed in No Build and light rail alternatives as analyzed in the Lynnwood Link Extension EIS with potential impacts at reduced service levels without the OMSF.

Table R-2. Comparison of Potential Effects of Lynnwood Link Extension Without OMSF

Effect		Comparative Impacts with Reduced Capacity/No OMSF
Ridership		Reduced ridership due to reduced capacity and overcrowding.
Transportation	Number of intersections requiring mitigation	Same or fewer due to reduced ridership.
	I-5 congestion	Increased congestion.
	I-5 bridges rebuilt	Similar, project facilities would be unchanged.
	I-5 ramps relocated	Similar, project facilities would be unchanged.
	Realigned streets	Similar, project facilities would be unchanged.
	Number of parking spaces removed	Similar, project facilities would be unchanged.
Acquisitions, Displacements and Relocations		Similar, project facilities would be unchanged.
Land Use		Similar, project facilities would be unchanged.
Economics		Similar, project facilities would be unchanged.
Social Impacts, Community Facilities, and Neighborhoods		Similar, project facilities would be unchanged.
Visual and Aesthetic Resources		Similar, project facilities would be unchanged.

Table R-2. Comparison of Potential Effects of Lynnwood Link Extension Without OMSF

Effect	Comparative Impacts with Reduced Capacity/No OMSF
Air Quality and Greenhouse Gases	Predicted reduction in VMT would be less, resulting in less air quality benefit. Construction impact would be the same as project facilities would be unchanged.
Noise and Vibration	Slightly reduced due to fewer and shorter train pass-bys.
Ecosystem Resources	Similar, project facilities would be unchanged.
Water Resources	Similar, project facilities would be unchanged.
Energy	Reduction in energy consumption for travel would be less due to a smaller reduction in VMT.
Geology and Soils	Similar, project facilities would be unchanged.
Hazardous Materials	Similar, project facilities would be unchanged.
Electromagnetic Fields	Negligible reduction due to fewer train pass-bys.
Public Services, Safety and Security	Similar because project facilities would be unchanged. Fewer passengers could reduce potential for accidents.
Utilities	Similar, project facilities would be unchanged. Electricity demand to power the system would be reduced.
Cultural Resources	Similar, project facilities would be unchanged.
Parks and Recreational Resources	Similar, project facilities would be unchanged.

Sound Transit wants to hear from you. Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

B-001-001 While I support light rail, Segment C alternatives C1 and C2 appear to have much more negative impact than C3. Both C1 and C2 affect current quiet residential areas, wetlands and businesses. C2 takes out my brand new building! We employ 100 people. C3 is on mostly undeveloped land. It seems that the only reason not to build C3 is that people would need to walk a bit further. Seems like this could be easily mitigated by re-arranging bus lanes. Build C3!

Subject: comment on transit station

B-002-001 If the transit station is anywhere other than the current location, we will relocate our business operations. We will not remain in any area of Lynnwood. This would be devastating for all of the small businesses. C3 would be the only location we could live with. All of our business associates in the area will do the same….

Re: Comments on Lynnwood Link Extension DEIS

Dear Sound Transit Board:

B-003-001

Cairncross & Hempelmann, PS, represents several local, national, and international real estate developers constructing and/or planning Transit-Oriented Development ("TOD") projects adjacent to existing and future Sound Transit light rail stations. Locating walkable, compact, and vibrant communities near transit stations serves the laudable goals of our regional transit system. First, it reduces household transportation costs, decreases overall regional travel time, increases the pool of workers and consumers for companies, and mitigates environmental problems associated with auto travel. Second, TOD projects increase transit ridership and revenue, which support the ongoing vitality of the transit system. Third, walkable, compact and vibrant communities near light rail stations improve the quality of life for those inside such communities, and also for the entire region by mitigating the many potential impacts of our region's rapid population growth.

Sound Transit has recognized these and other benefits of TOD projects in Resolution No. R2-2012-24 – Attachment A ("Sound Transit TOD Policy"). With regard to the planning and developing transit facilities, Sound Transit TOD Policy at Section 5(A)(2) specifically provides: "As Sound Transit progresses through the project development phases of its transit facilities….Sound Transit will [a]ssess the extent to which development of alignments, station locations, and transit support facilities affect and support implementation of…TOD strategies." Because TOD projects and the communities they create are so important to the success of the Lynnwood Link Extension and because our clients will be creating those TOD communities, we submit this comment letter to recommend the best station alternatives for successful TOD projects and, consequently, a successful regional transportation system.

B-003-001

Thank you for providing your assessment of the transit-oriented development (TOD) potential for station alternatives considered in the Draft EIS. Sound Transit is committed to supporting TOD around its light rail stations. To that end, the agency's planning process has included public involvement and the evaluation of TOD potential for the station alternatives considered in the EIS. Sound Transit appreciates your recommendations.

B-003-002

Segment A: Northgate to Shoreline

The proposed station at NE 145th Street has great TOD potential. NE 145th Street is a major thoroughfare (SR 523). It will allow for increased accessibility to the station and adjacent TOD projects. Also, the proximity of 15th Avenue NE and its mix of uses will help draw passengers eastward from the station and facilitate the type of density needed between 15th Avenue NE and the station area.

The proposed station at NE 155th Street should be rejected. Station locations at NE 145th Street and NE 185th Street are preferable for several reasons. First, NE 145th Street (SR 523) has greater accessibility from the surrounding areas, including Bothell Way NE and Lake City Way NE (SR 522). The NE 145th Street station will serve the residents of Lake Forest Park, Kenmore, and Bothell, among others. Second, NE 145th Street is a main thoroughfare capable of handling the increased capacity of transit riders traveling to the station. Third, unlike NE 155th Street which is primarily a single-family neighborhood, NE 145th Street already contains a mix of uses nearby that will allow for a smoother transition to the kind of density that is appropriate near a regional light rail station. Finally, the City of Shoreline already has begun planning for increased density around the NE 145th Street station to facilitate TOD projects and the community and city-wide benefits they will provide. *See* City of Shoreline Comment letter dated September 16, 2013.

All of the Alternatives for Segment A include a station at NE 185th Street. Except for Alternative A-1, all of the Alternatives include a parking garage or parking lot immediately east of the station. A large parking structure adjacent to the station has the potential to discourage potential riders from walking or biking to the station. However, if carefully located, designed, and scaled, parking east of the station could be integrated successfully into a TOD community. Any parking should be integrated into the TOD community, rather than act as a physical or visual barrier between pedestrians and the station.

Conclusion: Alternative A-3 provides the best TOD potential for the NE 145th Street and NE 185th Street stations.

B-003-003

Segment B: Shoreline to Mountlake Terrace

Alternative B-4 should be rejected. It locates the Mountlake Terrace station within the I-5 median, which would not encourage pedestrian access from nearby residents. B-1, B-2, and B-2A are the better options for facilitating a successful TOD community.

Conclusion: Alternatives B-1, B-2, and B-2A provide the best TOD potential for the Mountlake Terrace station.

Segment C: Mountlake Terrace to Lynnwood

B-003-002

Your preference for Alternative A3 based on your assessment of its TOD potential is noted. The Preferred Alternative incorporates several elements you identify as supporting TOD in the NE 145th Street and NE 185th Street station areas.

B-003-003

Your preference for Alternatives B1, B2, and B2A based on TOD potential is noted.

B-003-004

Alternative C-1 provides the best TOD potential for the Lynnwood Park-and-Ride station. We disagree with the conclusion in the DEIS (see Table S-4) that the Alternative C-2 and C-3 station locations have the same development/TOD potential as C-1. C-1 is a shorter walking distance to the city center. Additionally, C-1 is located adjacent to several sites with strong development potential. Further, C-2 and C-3 are at a lower elevation than C-1 and therefore would require a more burdensome walk up the hill to the transit station, thereby discouraging ridership.

Conclusion: Alternative C-1 provides the best TOD potential for the Lynnwood Park-and-Ride station.

Thank you for consideration of our comments.

Very truly yours,

John W. Hempelmann

JWH:msd

{02396206.DOCX;1 }

B-003-004

While you conclude that Alternative C1 provides the best TOD potential, Sound Transit's TOD assessment summarized in Section 4.2.4 (Land Use Indirect and Secondary Impacts) of the Draft and Final EIS considers a wider range of factors than just the potential for redevelopment on immediately adjacent parcels. Sound Transit assessed TOD potential at the station areas using four elements: (1) existing conditions supporting transit-oriented development, (2) transit-supportive plans and policies, (3) station access, and (4) potential development opportunities.

Sound Transit DEIS
Comments, c/o Lauren Swift
401 S Jackson St.
Seattle, WA 98104

Dear Ms. Swift,

We lease commercial space located at 20815 52nd Ave West in Lynnwood, owned by Jeff Carter and Lisa Peterson. We have been in business since 1973 (40 years!), and at this location since 1994. The bulk of our customers are schools, churches, sports teams, clubs, and other groups from the nearby surrounding areas. With other trophy shops in close proximity to us, the fact that we have had long-term stability in one place has been a benefit to our business. We have watched other trophy shops move over the years and with that we have picked up MANY of their customers due to the fact it was no longer convenient to track down where they moved. We cannot afford to have the same thing happen.

B-004-001 We are writing to express our support for the alignments that do **not** run up 52nd Ave West. Alternatives C-1 and C-2 would have an extremely detrimental impact on us, forcing us to either move or sell our business, or to close up completely.

B-004-002 As we stated above...IF we were to move, we would lose customers who have become accustomed to coming to the same location for some 20 years. At any new location, we would have to remodel the space to fit our needs, would have to move inventory and equipment, and change all of our advertising. All of this time and expense would result in significant lost income. It would be difficult to find a comparable location that has good parking, easy access to I-5 and I-405, a space that gives us both a working area and a retail store front – all at a long-term lease for the same rate.

The value of our business would be negatively impacted if we were to sell, because any new buyer would inherit the reduced street access, limited visibility, and other environmental impacts.

B-004-003 We are also concerned about the ability of our company to maintain the quality of work for which it is known. Our customers keep coming back because we offer them custom designs, excellent customer service, and always deliver a quality product. Vibration from either the construction and/or the train itself would make the laser, tools and presses that we use to both design and fabricate the awards more difficult to maintain and cause them to put out poorer quality. The could cause us to have to work our schedules around the construction or train interference and those times would not coincide with our customer base needs.

B-004-004 Noise is also an issue. When customers come to our shop, it is important for them to be able to communicate with us about their custom orders, and loud noises from either construction or the train would make that difficult. Plus we do a lot of communication on the phone as well. That can already at times be difficult but with this new possibility it would make it almost impossible.

B-004-005 We also live in this neighborhood – on 208th, just a few blocks away from our business. This area is both home and work, and the light rail, if situated on 52nd Ave West, would put both our house

B-004-001

Your concerns regarding the potential impacts of Alternative C1 and C2 to your business are noted.

B-004-002

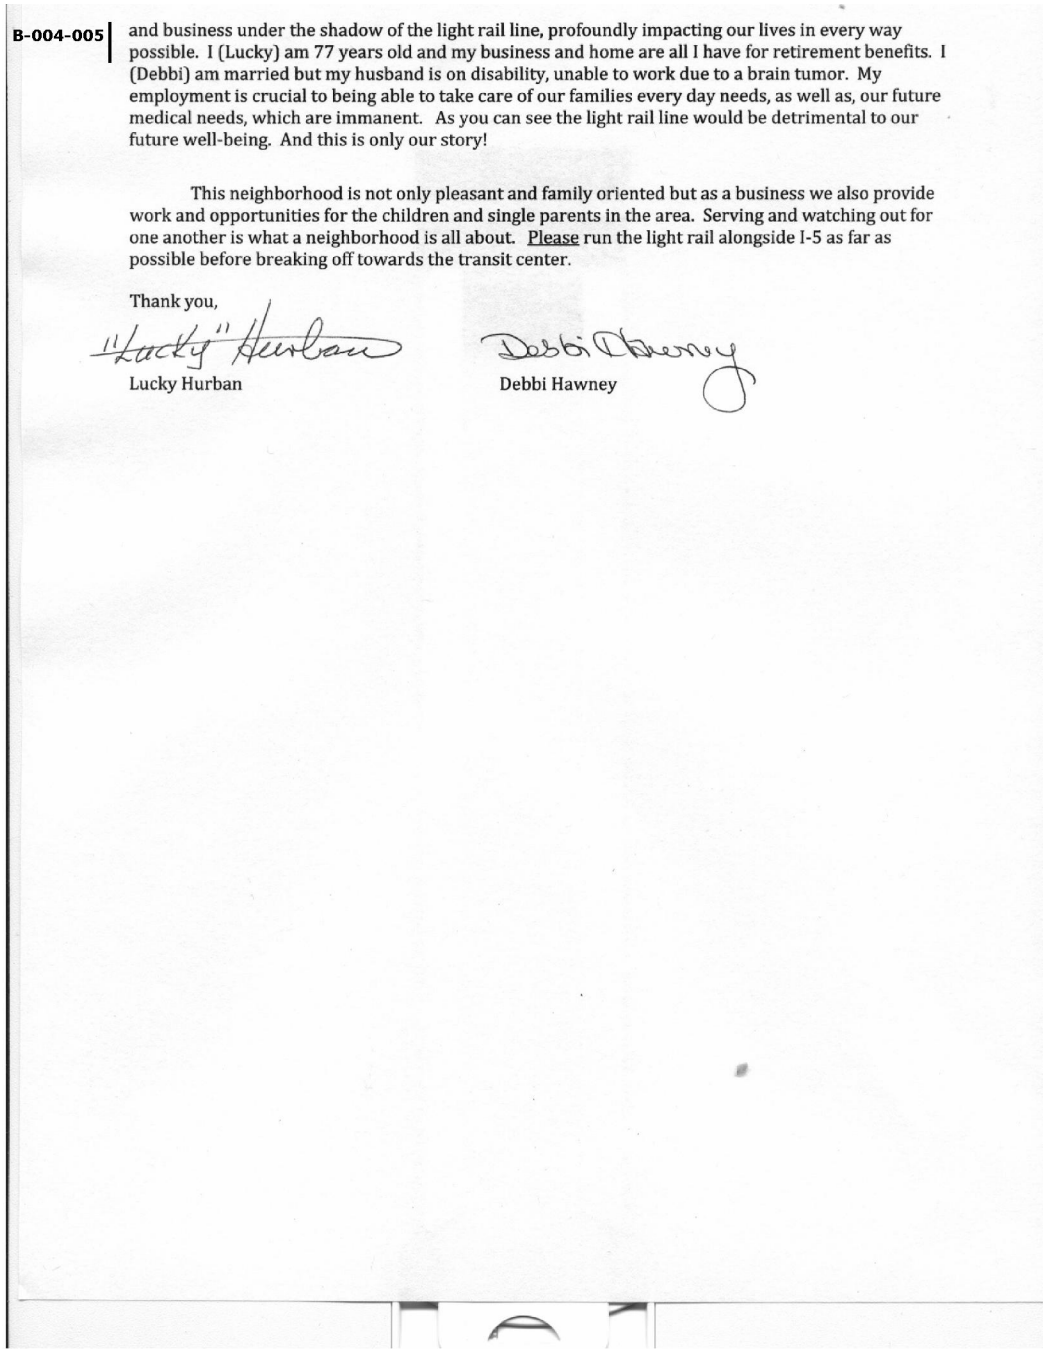
Thank you for your comment about your concerns about business displacement under Alternatives C1 and C2.

If your business were to be displaced (which the Preferred Alternative avoids), Sound Transit would provide relocation services as well as compensation. An interview would be conducted to determine your needs for a comparable and affordable replacement property. Services would include ongoing information on the availability and lease costs of commercial properties meeting your needs. Compensation could include expenses related to finding a replacement property, existing tenant-owned improvements, permits and improvements at the new building, moving expenses, operating permits and licenses, as well as new advertising materials and stationary.

For additional information, please see Section 4.1 Acquisitions, Displacements, and Relocations.

B-004-003

The Noise and Vibration Technical Report, included with the Final EIS on CD, has additional discussion of the standards used to define vibration levels and impacts for permanent or construction-related activities. Sound Transit does not anticipate vibration levels to disrupt normal operations at your business. Construction vibration mitigation described in the Final EIS would be implemented during work at the property, if Alternatives C1 or C2 were implemented. Where construction activity close to the building is unavoidable, Sound Transit would work with the owners/tenants to stage work in ways that would be less disruptive to their operations.



B-004-005 and business under the shadow of the light rail line, profoundly impacting our lives in every way possible. I (Lucky) am 77 years old and my business and home are all I have for retirement benefits. I (Debbi) am married but my husband is on disability, unable to work due to a brain tumor. My employment is crucial to being able to take care of our families every day needs, as well as, our future medical needs, which are immanent. As you can see the light rail line would be detrimental to our future well-being. And this is only our story!

This neighborhood is not only pleasant and family oriented but as a business we also provide work and opportunities for the children and single parents in the area. Serving and watching out for one another is what a neighborhood is all about. Please run the light rail alongside I-5 as far as possible before breaking off towards the transit center.

Thank you,

"Lucky" Hurban — Lucky Hurban

Debbi Hawney — Debbi Hawney

B-004-004

The FTA criteria for transit noise are based on exterior noise levels, which makes them a more conservative measure of impacts for interior noise. If your business is able to perform with the traffic noise in this area, noise from the light rail, while possibly audible, would not be expected to affect your operations.

For construction, the City of Lynnwood construction noise ordinance would be applicable, and Sound Transit is committed to maintaining construction noise levels within the criteria. Further, construction noise for this project is similar to construction noise for a paving project, building construction, or any other construction project, and Sound Transit works with local residences and businesses to minimize construction impacts.

B-004-005

Sound Transit notes your concerns about Alternatives C1 and C2. The Preferred Alternative does not use the 52nd Avenue W alignment, and would avoid impacting the businesses and residences along the street.

Sound Transit
Draft EIS Comments
c/o Lauren Swift
401 S Jackson St
Seattle, WA 98104

Dear Ms. Swift,

We own property located at 20815 52nd Ave W in Lynnwood (tax lot numbers 27042100403600 and 4100). Our small business, JC Auto Restoration, Inc., is located in this building, as is our long-term tenant, Cascade Trophy. We appreciate this opportunity to submit our feedback on the Draft EIS for the proposed Lynnwood Link Extension Alignments.

B-005-001

We much prefer the alternatives that do not run up 52nd Ave West. Alternative C-3 and the City of Lynnwood's proposed C-4 alternative would have the least impact on our property and business, to Cascade Trophy, and be least disruptive to the neighborhood. If Sound Transit were to acquire all, or a portion, of our property, it would have a huge impact on us personally, on our business, and on our tenant's business.

Jeff is self-employed and has no employer-established retirement fund. In the late 1990s, our business was outgrowing its location. As we looked for a new space, Jeff also looked to see what other people were doing who were in a similar line of work. The only ones who could retire were those who owned their shop property. The rest were working into their 70s and 80s, just scraping by. In 2000 we took out all of the equity we could from our home, and purchased this commercial building. It would be both the new location for the shop and our investment in Jeff's retirement. For many years our income and cash supply was greatly restricted because of this purchase. We felt that in the long run, it would give us good retirement income, whether we decide to lease the space once Jeff is no longer working, or if we sold the building. We will have it paid off in 2025.

If the Lynnwood Link Light Rail were to run on Alignments C-1 or C-2, Sound Transit, as we understand it, would acquire either part or all of our property. In either case we would lose market value and future income for Jeff's retirement.

If Sound Transit were to acquire the entire property, we would lose our existing tenant, Cascade Trophy, and have to relocate our business. We would lose future rental income, and depending upon the replacement building, lose future increase in property value as well. If JC Auto Restoration had to move, we would have to move all of our equipment, customized shelving, tools, customer cars and extensive vintage auto parts inventory. The estimated time to pack up, remodel the new building as needed, set up, and return to normal business operations is over one year. We would likely have to lay off our employees, Jeff would lose all personal and business income for this time, and JC Auto Restoration would be responsible for significant unemployment taxes for our employees for several years. Many customers would go elsewhere and not return, resulting in loss of future business.

Even if Sound Transit were to acquire just part of the property for the right of way and/or pylon placement, we would see a significant negative impact. Not only would the value of the property drop, but the rate that we could charge to future lease-holders would drop as well.

Our current tenant, Cascade Trophy, has been one of the best tenants you could ask for. They have been at this location since before we bought our building. We rely on their rent for our mortgage payment, and if Sound Transit were to choose alternatives C-1 or C-2, the chances are excellent that the owner, August "Lucky" Hurban, would either sell the business to a new owner at a new location, or

B-005-001

Thank you for your comment stating a preference for a modified Alternative C3. Sound Transit identified a modified Alternative C3 as its Preferred Alternative in the Final EIS, and this alternative would avoid impacting your property and business. Please note that Sound Transit policy provides for a fair and equitable means of addressing real property impacts across its projects. Consistent with state and federal law, this policy requires Sound Transit to fairly compensate for property acquisitions, and to provide compensation and relocation for displaced businesses. If an alternative affecting your property were to move forward, Sound Transit would work with you and any affected businesses to negotiate fair compensation and relocation benefits.

B-005-001 would close completely. In either case, we would lose an outstanding tenant. It would be extremely difficult, if not impossible, to find a new tenant who would be willing to pay the same rate per square footage, would need no modifications to the space, and would commit to a long-term lease.

B-005-002 Like all retail businesses, both JC Auto Restoration and Cascade Trophy need easy in-and-out street access for customers, good visibility from the street, and adequate parking. Cascade Trophy frequently has people driving in to drop off and pick up orders. JC Auto needs ample parking, with a large enough area for an enclosed car hauler to safely drop off and pick up customers' valuable vintage automobiles. It also needs comfortable access to its two garage doors, keeping in mind that vintage automobiles have a wider turning radius than a modern subcompact, and require more space for maneuverability. Both Cascade Trophy and JC also need access for delivery trucks on a daily basis.

B-005-003 The vibration of both the construction and the running of the light rail could have a negative impact as well. Cascade Trophy uses sensitive laser cutting equipment to etch sophisticated designs and lettering on plaques, trophies, and signs. JC Auto uses vintage equipment to calibrate and adjust gauges, speedometers, automotive record players, and other electrical and mechanical components of antique automobiles. All of these tools are affected by vibration, as are their computers and security systems.

B-005-004 Noise is a concern as well. It is already difficult to have a conversation outside, especially on the phone, over the freeway noise, and it would be impossible over the sound of either the construction or the train itself. We anticipate that during construction there will be significant noise impacts even inside the building, which will greatly affect communication with customers for both companies.

B-005-005 On a larger scale, we are concerned about the wider impact on the neighborhood if alignments C-1 or C-2 are chosen. The small businesses in the area provide employment for local residents. Many of have been in the same location for years, if not decades, providing stability and income to the area. Relocating the DSHS, Vocational Rehabilitation and Work Source offices would be a hardship for economically disadvantaged and disabled individuals. The 2010 census shows that this area is home to a high percentage of individuals who live in rentals, are from minority backgrounds, are low income, have never gone to college, and who speak a language other than English at home. Some are more recent immigrants who do not have full awareness of how they can express their opinion about this decision. Many come from countries where the population – particularly the women - not only does not, but cannot, participate in the political process. Many are children. Therefore, a significant percentage of the population affected may be essentially without a voice in this process.

B-005-006 We would much prefer to have the Link Extension Alignment sited parallel to the freeway rather than on 52nd Ave West. This option would preserve parkland, residences, apartment buildings, and businesses – including our own - and would be the least disruptive to the community.

We have participated in Sound Transit information sessions, as well as sessions hosted by the City of Lynnwood. Those meetings have been informative and helpful, particularly the ones hosted by Sound Transit. Thank you for giving the community opportunities to learn about the project and provide feedback.

Sincerely,

Jeff Carter
Owner, JC Auto Restoration, Inc.

206-375-2696

Lisa Peterson, MS
Director, UW GenOM Project
http://depts.washington.edu/genomics/index.shtml
206-499-6085

B-005-002

Thank you for your comments about property access, parking, and circulation needs for your property at 52nd Ave W. If Alternative C1 or C2 is selected for the project to be built, properties that are not fully acquired would retain their functional access, and would have sufficient levels of parking, circulation, and freight/delivery accessiblity as needed for their operations.

B-005-003

The Noise and Vibration Technical Report accompanying the Final EIS has additional discussion of the standards used to define vibration levels and impacts for permanent or construction-related activities. Sound Transit does not anticipate vibration levels to disrupt normal operations at your business. Construction vibration mitigation described in the Final EIS would be implemented during work at the property as appropriate, if Alternatives C1 or C2 were implemented. Where construction activity close to the building is unavoidable, Sound Transit would work with the owners/tenants to stage work in ways that would be less disruptive to their operations.

B-005-004

The FTA criteria for noise are based on exterior noise levels, which makes them a more conservative predictor of potential impacts for noise-sensitive building interiors. If your business is able to perform with the traffic noise in this area, noise from the light rail, while possibly audible, would not be expected to affect your operations. Light rail is typically quieter than the heavy trucks on the roadway near you.

For construction, the City of Lynnwood construction noise ordinance would apply. Sound Transit expects to limit construction noise levels to be within the City's criteria. Further, construction noise for this project is similar to construction noise for a paving project, building construction, or

any other construction project, and Sound Transit works with the city, local residences and businesses to minimize construction impacts.

B-005-005

Sound Transit appreciates your concerns about the potential community impacts of Alternatives C1 and C2. As described in your comments, the Lynnwood community is very diverse and includes racial and ethnic minorities, persons with limited English proficiency, and those with low and moderate income. As part of Sound Transit's community outreach efforts during project planning and the environmental review process, special outreach activities have been conducted to involve these community groups in the public decision-making process leading to the selection of a preferred alternative for the Lynnwood Link Extension project. These efforts included the availability of translated materials and interpreters upon request. See Chapter 7 of the Final EIS for a summary of the public comments received on the Draft EIS and Appendix C for a listing of outreach activities and comments specifically targeted for minority and low-income populations.

B-005-006

Your preference for an alternative parallel to the freeway rather than on 52nd Avenue W due to business impacts and impacts to Work Source are noted.

Re: *Comments on Lynnwood Link Extension Draft Environmental Impact Statement (Draft EIS)*

Dear Ms. Swift:

B-006-001

We are the owners of the Northgate Plaza Apartments property at 11200 1st Avenue NE, north of Northgate Way and east of Interstate 5/1st Avenue NE. All of the Segment A alternatives place the light rail line between our property and the freeway. The Draft EIS acknowledges adverse impacts to our property and the need for mitigation. However, we do not believe the Draft EIS analysis fully takes account of the impacts to our property, in part because portions of the analysis are based on the existing use of the property, and not its planned use. We offer the following comments to be considered in preparation of the Final EIS and in implementation of the project.

Information about the Northgate Plaza Apartments Site

Our property is approximately 7.86 acres in size (342,548 square feet). It is presently developed with 34 one-story to two-story apartment buildings with 207 units that were constructed in 1951. In recognition that the existing buildings are nearing the end of their lifespan and require frequent repair to maintain them as rental units, we have spent a substantial amount of time and effort working with the City of Seattle on future development options for the property. The property is located within the Northgate Urban Center, and the City's Comprehensive Plan calls for much greater density than exists on the site at present.

In 2010 we proposed a rezone of the property from a Midrise to a Neighborhood Commercial 3 – 85 foot height limit designation. The purpose of the zoning change was to accommodate future mixed-use, commercial and multi-family residential development of substantially greater density. This zoning change was unanimously approved by the Seattle City Council in November 2012. The zoning change resulted in an increase of nearly 600,000 square feet of allowable building square footage. The new site zoning allows a wide mix of commercial and residential uses totaling over two million square feet of development.

F:\WINWORD\VJM\Fy2013\NPLLC Sound Transit letter.doc

B-006-001

Thank you for writing of your concerns about the potential impacts to your property at NE 11200 Street and First Avenue NE, and for describing your plans for the property.

The analysis of land use impacts in the Final EIS is based on existing land uses, approved land use plans, and other permitted developments. The potential for impacts is discussed in in Section 4.2.2 Long-Term Impacts. A site-specific analysis of potential impacts to a future development in the absence of approved plans or permits would be speculative, and therefore not considered in the EIS. However, in Appendix 4.2.2, Sound Transit has reviewed the consistency of the proposed alternatives against adopted plans and policies of the city, including the City of Seattle's Northgate Urban Center, and finds that the alternatives would support the City's intent to create a more compact urban center in the area. In addition, based on the current designs for the Preferred Alternative, the project would be across the street from your parcel and would not place any new restrictions on the use of your property.

B-006-001 Since the time the rezone was approved, we have identified development concepts for the property and anticipate proceeding with initial City approvals for portions of the site next year. Development along the eastern edge of the site, in proximity to the proposed light rail route, is anticipated to consist of office, hotel, and assisted living or multi-family residential uses. That development will be able to utilize the full allowed zoning height of 85 feet.

Comment on Preferred Alignment

B-006-002 Of the alternatives presented in the Draft EIS, we prefer Alternative A1 as it locates the alignment furthest from our property line and proposed development. The other alternatives come fairly close to the northwest corner of our property and could impair access to our site. Development options for the property have envisioned an internal access road along our northern property line, with a driveway at the northwest corner of the site. Thus, an alignment in close proximity to that corner is problematic in terms of our future development options and access.

We would appreciate the opportunity to meet with Sound Transit to obtain further information on the exact distance of the alignment and its associated structures vis-à-vis our property line.

B-006-003 **Access Impacts**

The Draft EIS states that the project would cause the adverse impact of "reduced access" to our property in particular. Draft EIS, p. 4-206. However, in the section on Transportation Construction Impacts, the Draft EIS states that "Local access would be maintained." The EIS needs to have a more complete discussion of access impacts on particular properties, such as ours, during the construction process. There should be a commitment to work with property owners in devising appropriate mitigation for those impacts.

In addition, there needs to be full disclosure of any long-term access impacts and a commitment to appropriate mitigation.

B-006-004 **Noise and Vibration Impacts**

Given the proximity of the alignment and inclusion of crossover switches, the Draft EIS acknowledges that at and near our property, noise and vibration impacts would be "moderate to severe for all alternatives" unless mitigation is implemented. The Draft EIS states that mitigation would be incorporated as part of the project, but then states that it is "Sound Transit's policy" to mitigate noise that would otherwise result in moderate or severe impacts. Draft EIS, p. 4-125. However, mitigation of impacts (both noise and vibration) should be more than a matter of "policy" and instead should be clearly incorporated into the project as required mitigation.

F:\WINWORD\VJM\Fy2013\NPLLC Sound Transit letter.doc

B-006-002

Your comment in favor of Alternative A1 is noted Alternative A1 is the basis for the Preferred Alternative, which would be across 1st Avenue from your property. Based on current plans for construction, there would be no physical impacts to your property and no changes to your access due to the light rail project.

B-006-003

The Draft EIS text regarding "reduced access" in the cultural resources section of the document referred to construction period effects, but a revised description in the Final EIS clarifies that access could be modified. Access would be maintained, consistent with the text in the Transportation Technical Report. There could be modified access for travel from some directions during construction periods,such as when flaggers are present on 1st Avenue or other nearby streets to accommodate construction activities. Delays could occur, but access to adjacent properties (land and buildings) would be maintained. Depending on required construction activities, access to the property may need to be reduced (e.g., one lane instead of two lanes) or otherwise altered (e.g., short-term reroute of the access) from conditions prior to the start of construction. Parcel-specific details would be determined during final design, in coordination with the City of Seattle and affected property owners. Section 3.6.9 also lists a variety of mitigation measures that Sound Transit will use to reduce impacts on adjacent property owners, residents, and businesses. These include communication about construction activities using a variety of methods and obtaining written permission from property owners to make temporary changes to access. Moreover, should construction activities require temporary use of a small portion of your property, then the conditions of use would be negotiated in a legally binding temporary construction easement.

B-006-005

Historic Resources

The Draft EIS concluded that the Northgate Plaza Apartments are eligible under Criterion C for listing on the National Register of Historic Places (NRHP). We do not agree with that conclusion. And we note that a private property may not be nominated for or placed on the NRHP unless the private property owner agrees.

As part of our rezone process, the history of site development was fully documented. That information was then reviewed by City Staff and resulted in a determination by the City of Seattle Landmarks Preservation Board that the structures were unlikely to meet the standard for designation as historic landmarks. (Department of Neighborhoods, LPB 58/11). This determination governed for purposes of the State Environmental Policy Act and City review of the rezone.

It should be noted that although there are some differences between Seattle Landmark criteria and NRHP criteria, NRHP Criterion C (under which our buildings are considered eligible by the Draft EIS) is in substance the same as the City's Landmark criteria. Thus, the City's determination of non-eligibility should be factored into the analysis in the Sound Transit EIS.

Conclusion

We appreciate your consideration of our comments and would welcome the opportunity to discuss the project with you further.

Very truly yours,

Vincent J. Mullally
Managing Member, Northgate Plaza LLC

F:\WINWORD\VJM\Fy2013\NPLLC Sound Transit letter.doc

B-006-004

Sound Transit's policy is to mitigate noise and vibration impacts consistent with federal, state, and local criteria. Section 4.7.7 of the Draft and Final EIS identify potential mitigation to be incorporated into the project. Mitigation measures may be refined during final design but will continue to meet applicable federal, state, and local noise criteria.

B-006-005

Federal agencies must comply with Section 106 of the National Historic Preservation Act, which addresses properties eligible for listing in the National Register of Historic Places (NRHP). Local land use and landmark decisions are not relevant to NRHP eligibility. While the designation criteria are similar, their application by the Washington Department of Archaeology and Historic Preservation (DAHP) and the Seattle Landmarks Preservation Board may differ. FTA determined, and DAHP concurred, that the Northgate Plaza Apartments are eligible for NRHP listing because they are an intact example of a particular type of apartment complex typical of the post-war era. This determination does not constitute nomination to the NRHP and owner consent is not required.

Sound Transit DEIS
Comments c/o Lauren Swift
401 S. Jackson Street
Seattle, WA 98104
LynnwoodLinkDEIS@soundtransit.org

Re: Lynnwood Link Extension Draft Environmental Impact Statement ("DEIS")

Dear Ms. Swift,

On behalf of the Northgate Mall Partnership, which is owned by the Simon Property Group (collectively "Simon"), we submit the following comments with respect to the DEIS. Simon owns and operates the Northgate Mall ("Mall") located in the Northgate neighborhood in Seattle (located between Northgate Way and NE 103rd Street and 1st and 5th Avenues NE). The Northgate Mall is located at the terminus of Sound Transit's proposed Northgate Link and the beginning of the proposed Lynnwood Link.

Simon is the largest retail real estate company in the world. Simon owns or has interests in 325 properties throughout North America and Asia. In Washington, in addition to the Mall, Simon owns the Tacoma Mall, Columbia Center Mall in Kennewick, North Bend Premium Outlets, and Seattle Premium Outlets in Tulalip. A number of Simon's mall properties are located at or near public transit/rail stations, including on the west coast the Fashion Valley Mall (San Diego Trolley), and Stanford Mall and Stoneridge Mall in the Bay Area (BART), with Stoneridge experiencing the addition of a new BART stop and BART parking deck in 2011. Simon has extensive experience from these projects – both in the effects and potential mitigation of their cost, construction/implementation and post-construction operation – that it believes is relevant to evaluate and consider in order for Sound Transit to improve its plans, lower its project costs, and avoid, reduce and mitigate its impacts on the Northgate Mall and its neighbors.

B-007-001 The probable significant, unmitigated, direct, indirect and cumulative adverse environmental impacts of Sound Transit's proposed Lynnwood Link Extension, the Northgate Extension, together with King County's more recently unveiled plans for transit-oriented development on the current Northgate Transit Station site (proposed for the property directly to the south of the Northgate Mall) that Sound Transit is facilitating, hereafter collectively referred to as the "Projects", will be substantial, particularly with the traffic and overused public parking impacts that already exist and the many years of continuous construction and traffic impacts from the Projects that will persist in the future.

B-007-001

Sound Transit, King County, and the City of Seattle have been involved in planning transit improvements and related developments in the Northgate area for over a decade. The projects and plans to extend high-capacity transit to and beyond the Northgate transit center reflect the designation of the Northgate area as a regional growth center. Sound Transit is committed to working coorperatively with Simon, other stakeholders, the City and King County throughout the development of the Northgate Link Extension, as well as for the future Lynnwood Link Extension.

There is also a long history of environmental documents examining enviromental impacts and identifying mitigation commitments for the Northgate Link Extension, and now for the Lynnwood Link Extension. (The King County Transit Oriented development project has not yet advanced to the stage of planning or permitting involving environmental review.) The extension to a station at Northgate was originally part of the Central Link Draft and Final EIS (1998-1999) and the subsequent North Link Draft and Final Supplemental EIS (2002-2006).

In addition, the Lynnwood Link Extension Draft and Final EIS examine direct, indirect and cumulative impacts in Chapters 3 and 4 (in direct, indirect as well as cumulative effects discussions by environmental topic). The primary other project discussed in the Northgate area is Sound Transit's Northgate Extension, which is assumed under the No Build Alternative, as is the underlying growth in development, population and employment for the Northgate area and the region through 2035. (Plans for King County's Transit-Oriented Development project remain conceptual).

As the following responses to comments explain, Sound Transit expects that many of the primary issues of concern in your letter (largely traffic and construction period impacts) will be resolved through continued

B-007-001 The Projects will impact:

- Mall traffic ingress, egress and access at several key points,
- visibility and clarity of mall access for customers from I-5 and 1st Avenue NE,
- visibility of the Mall - interrupted in the short to medium term with construction, and in the long term freeway views will be permanently diminished or blocked (which are key for these type of regional retail facilities that serve large (300,000+) population bases),
- traffic on the roads and arterials surrounding the Mall from the initial planned work on Northgate Station facilities as early as 2014, to 2023 upon expected completion of the Lynnwood Link line,
- exacerbation of the already existing "Hide and Ride/Park" problems in the vicinity, associated not only with undersized Metro park and ride facilities, but also other undersized public parking facilities such as the local library branch to the east of the Mall, and
- Mall patron parking and circulation due to the proposed use of the most heavily patronized Mall parking lot as both a long-term construction staging area for both the Northgate Station and Extension and the Lynnwood Link Extension, and potentially for placement of a Sound Transit park-and-ride garage on Mall property if not placed on King County's current Transit Station site.

B-007-002 There are substantial reasons to be concerned that the cumulative impacts of the Projects will be very disruptive to the Mall and its commercial and residential neighbors, for perhaps as much as ten years of continuous intensive construction activity, as well as the longer-term conditions with the transit network in place and the significantly higher density development occurring immediately surrounding the 60+ year old facility.

Simon has engaged Transportation Engineering NorthWest ("TENW") to conduct a more in-depth analysis of potential impacts and expects a formal report of their findings later in October 2013. Simon will supplement these comments with TENW's report when completed.

B-007-003 To help address and minimize impacts to the Mall and surrounding business and residential neighbors, it is critical that Sound Transit carefully consider and coordinate construction plans and cumulative traffic for the Northgate Extension with the Lynnwood Link and Metro's plans for transit-oriented development (TOD) south of the Mall, for:

(a) the potential overlapping construction periods prior to the opening of the Northgate Station,

coordination for the final design and construction planning work for the Northgate Link Extension. This approach is consistent with the impacts and mitgation commitments originally defined in the North Link Final EIS and its Record of Decision. Many of the areas that are identified as sources of concern in your letter would not be further aggravated by the construction and operation of the Lynnwood Link Extension. The Lynnwood project would be less intensive and more physically removed from the Northgate station and transit-oriented development (TOD) areas, bringing a lower potential for higher cumulative impacts than for any of the other projects alone. In addition, the development of the Lynnwood Link Extension would actually reduce the number of riders/patrons needing to access the Link system at Northgate, which would lessen rather than increase long term traffic compared to the Northgate Link Extension alone.

To help further illustrate this point, the Final EIS for the Lynnwood Link Extension has updated its discussion of the Northgate Link Extension and has added a description of the King County TOD project. In earlier planning for the Lynnwood Link Extension Draft EIS, Sound Transit and the City of Seattle considered intersections of concern for worsened conditions with the Lynnwood Extension, and had concluded that no adverse impacts were likely because the Lynnwood Link project would reduce the number of trips destined to Northgate. Finally, Sound Transit has developed further information on its planned construction approaches, and is incorporating the latest information on the Northgate Link Extension's construction program, and further discussions of these issues are included in the Transportation Technical Report.

B-007-002

Sound Transit does not anticipate a continuous 10 years of major construction activities for the combined projects. The Lynnwood Link Extension's major construction activities near Northgate would be about one year, shorter than the other projects, and involving primarily the

B-007-003

(b) the construction window for the Lynnwood extension coupled with the anticipated extraordinary use of the area around Northgate Station for parking for commuters when Northgate Station is open, but Lynnwood is still under construction, and

(c) for the longer term conditions when the Lynnwood Station is finally open, and Northgate area is no longer the critical transfer point from automobiles to transit for the general public.

The analyses should also include understanding the relationship between what is already a fully utilized park-and-ride condition today, how that will change when the Northgate Link is open and the end node for commuters from the north, and considered in concert with the potential loss of the existing surface lots of the Metro Transit Center today for planned TOD development over that entire site. Simon expects there to be a period of time before the Lynnwood Link is open when there will be an extraordinary burden on parking, as well as on traffic in the areas as noted above, but the unique impact to the Mall for the likelihood of significant commuter use of the Mall's private parking (as "park-and-hide" or "hide and ride") that is provided for, required for, and intended for the Mall's retailers/customers. This "hide and ride" activity would be a direct impact to the Mall and in direct conflict with the Mall's operating hours. The Mall's neighbors, both business and residential, face similar burdens that will be dramatically exacerbated by Sound Transit's plans for North Link and Lynnwood Link, and King County's related "Transit Oriented Development" proposal.

This is of significant concern, especially for those weekday evenings when commuters have not returned to their cars and Mall customers cannot find parking because commuters (who have parked on the Mall property all day) are still occupying spaces in Mall lots (and most likely the most preferred spaces along the west side of the Mall). If Sound Transit's expectations regarding ridership are even remotely realized (recognizing that the State's auditor has found them to have been overstated and has requested they be reconsidered), the problem will likely be worse on local sports weekends for Seahawk and Husky games, and on the evenings throughout the spring, summer and early fall for Mariner games, when Mall parking is in most demand for shopping. These are real, foreseeable adverse impacts and ones Simon has experienced elsewhere that should reasonably be expected to occur once the Northgate Station and Link opens. Moreover, the impacts will continue to be exacerbated by the overlapping continuation of construction of the Lynnwood Link, and would be further exacerbated by potential implementation of a high density TOD on King County land that would shift the existing substantial parking demand off of that site, and most likely onto the Mall's, and add to the area's already strained traffic and parking demands.

Simon has been working with Sound Transit staff on ways to minimize construction-related parking impacts to the Mall, such as by placing the proposed Sound Transit/Metro park-and-ride garage on the Metro site to the south of the Mall. But to this point, those discussions have been looking at the Northgate Station and line extension project in a vacuum. As this next phase (Lynnwood Link) takes form, and the potential of a fully utilized King County TOD starts to take shape, the impacts on the Mall property and on the surrounding community must be analyzed in

construction of the guideway adjacent to the I-5 right of way. This would be north of the areas where the Northgate Station, park-and-ride, and Metro's Transit Oriented Development project would occur.

The analysis of traffic in the EIS through 2035 considers an underlying increase in traffic growth in the area due to the planned growth in jobs and housing in the Northgate Urban Center. The major investments in transit in the area have been considered in the analysis of traffic. This was the method used for the assessments of traffic for the Lynnwood Link Extension, as well as for the Northgate Link Extension.

For both projects, Sound Transit's mitigation commitments include measures to maintain access to the mall and surrounding neighborhoods, and to work with the City, County, Simon and other stakeholders to minimize impacts.

B-007-003

The North Link Final SEIS included a detailed review of parking impacts for the project and identified mitigation where appropriate. Sound Transit agrees that the planning and coordination of overlapping construction activities would help reduce individual as well as potential cumulative effects to traffic, access and parking. The Final EIS identifies such coordination as a mitigation measure for cumulative effects in section Section 3.6 of the Final EIS. The potential TOD on King County Metro property has not been reflected in Sound Transit projects' construction traffic analysis because there are no detailed plans available for that project, including a proposed date for construction. However, Sound Transit expects the development would be within assumed future growth in traffic levels that are already assumed as part of the No Build Alternative for the area, which incorporates more jobs, housing and trips in the Northgate district. In addition, park and ride supply at the Northgate Station is expected to be fully occupied. As the Lynnwood Link Extension project would include stations with new park and ride facilities

B-007-003 their totality, not segmented. Discussions between Simon and Sound Transit staff are ongoing, and we hope to develop better mitigation through those processes that should be included as part of Sound Transit's final Lynnwood Link EIS, and likely in a supplemental EIS for North Link, particularly if King County's proposal to convert its existing park and ride lot to a transit oriented development (eliminating the already oversubscribed parking) is not abandoned or at least substantially modified.

B-007-004 **I. Other Projects Considered for Cumulative Effects.**

In Appendix H, Sound Transit identified certain other projects that are "reasonably foreseeable" as part of the analysis of cumulative effects and the predictions of conditions for the future regional transportation system. However, Sound Transit did not identify the North Link Station and Extension nor the King County Metro Northgate TOD Project in the cumulative effects analysis. Both of these should be considered in the EIS analysis, and particularly in the Transportation Technical Report analysis to address private property and local circulation impacts to the Mall and other immediately surrounding businesses and residential neighborhoods. These projects should not be considered as "baseline" existing infrastructure.

B-007-005 **A. North Link.**

As you know, the North Link and Lynnwood Link are two "phases" of Sound Transit's larger light rail system plans. The North Link phase is essential to the purpose and function of the Lynnwood Link phase, and the North Link impacts should be considered in the Lynnwood Link EIS analysis. To that end, the Lynnwood Link DEIS should reconsider the Northgate Station Area local area traffic circulation, parking, and construction impacts along 1st Avenue NE, NE Northgate Way, the local freeway interchange system with I-5, Mall access and parking, all in an effort to address impacts in a comprehensive manner. In addition, alternatives presented in the Lynnwood Link DEIS demonstrate a "range" of ridership impacts that would occur at the Northgate Link Station area, yet no evaluation of increased parking or local area traffic impacts that would occur as a result of these ridership levels are evaluated. For Simon and its neighbors, it is crucial that Sound Transit consider how to best coordinate the construction and design of both phases in order to minimize long-term and short-term transportation and construction-related impacts to the Mall, located at the proposed intersection of these two phases.

B. King County Metro Site - Transit Oriented Development Plans.

B-007-006 The North Link Final SEIS (2006) included the following description for the transit oriented development plans for the Metro site south of the Mall:

> "King County Metro: Northgate Transit-Oriented Development Project
>
> King County is planning a high-density, mixed-use urban development on the existing Northgate Transit Center site. The site will continue to be an important transfer point and could accommodate additional services such as a light rail

to the north of Northgate, capturing trips to the north, this would help reduce demand for parking spaces at the Northgate Station, and is projected to reduce bus trips and vehicle trips as well, compared to levels experienced with the Northgate Extension alone.

B-007-004

The Northgate Extension is considered as part of No Build because the decision to build and operate the Northgate Link Extension has been made, the project has completed is environmental review, and it is fully funded. It will be in place and operating before the Lynnwood Link Extension is completed. The King County TOD project at Northgate has been added to this list of projects considered in the cumulative effects analysis in Final EIS, although further details and timing of the project remain unconfirmed at this time. In addition, in response to your comment, the cumulative construction effects for all three projects together are now discussed in more detail in the Final EIS, including in Chapter 3 of the Final EIS, as well as in the Transportation Technical Report.

As noted above, in terms of long term impacts, the Lynnwood Link Extension would attract transit trips to the north of the Northgate Station, which would help reduce demand for parking spaces at Northgate, and would reduce bus trips and vehicle trips as well, reducing the potential for adverse cumulative effects.

B-007-005

Based on modeling data for the Lynnwood Link Extension, which shows lower ridership and reduced trips to Northgate after Lynnwood Link opens, Sound Transit projects decreased transit-related traffic accessing Northgate. This supports a conclusion that there are no additional Link-related parking and traffic impacts in the Northgate Station area due to the Lynnwood Link Extension, and a detailed reexamination of long term

B-007-006

station. The existing capacity of the four park-and-ride lots in the Northgate area is approximately 1,400 stalls. The TOD project would replace these stalls and provide more spaces for commercial and residential use. Two new parking structures with 575 apartments; retail, restaurant, health club, hotel, or office space; a cinema; and a daycare center above the parking structure on the south lot are planned. A second parking structure at the northeast corner of First Avenue NE and NE 103rd Street would serve the north end of the future light rail station. Traffic congestion on First Avenue NE and Fifth Avenue NE would be relieved by intersection and signal improvements, additional lanes on NE 103rd Street, and the creation of a new street, Third Avenue NE, that connects the existing office park south of NE 100th Street with the mall north of NE 103rd Street. King County could "surplus" the park-and-ride lot at Fifth Avenue NE and NE 112th Street, located next to Target and Best Buy, giving the City of Seattle the opportunity to purchase it for creation of a park. By relocating the Northgate Transit Center to 1st Avenue NE, King County could provide excellent connections for passengers transferring between Metro buses and the future Sound Transit light rail station. King County Metro Transit and the City of Seattle have tentatively agreed that this proposal should be considered for further study. King County is studying the feasibility of sustainable building practices, such as "green roofs" for the buildings. Stormwater from the TOD project would be detained on site and potentially directed to the City of Seattle's stormwater treatment feature, "the Channel" at Thornton Creek. The following projects describe the development in Northgate in more detail . . ."

Source: North Link Final SEIS (2006), Appendix P4.18: Cumulative Effects Information at p. P4.18-3.

However, Appendix H of the DEIS does not identify the Metro Northgate TOD Project as a project considered in the cumulative effects analysis. This project should be included in the analysis, particularly if Sound Transit plans to support this project by building the mitigation/replacement park-and-ride garage on the Mall site. And, in addition, the potential impacts of the TOD if Lynnwood Link is NOT constructed, or even significantly delayed, should also be considered, since Sound Transit cannot guarantee Lynnwood Link's construction, let alone that it will be completed on schedule.

II. Impacts to Mall Access.

B-007-007

Figure 6-1 of the DEIS Transportation Technical Report (July 2013) shows a proposed construction staging area located on the Mall's western parking lot just south of NE 107th Street, with truck haul routes to and from the staging area and I-5 through the NE 107th Street on-ramps and off-ramps and also having truck haul routes use 1st Avenue NE north of NE 107th Street. There is also a note on Figure 6-1 that there may be "Temporary Closures (e.g., structure placement)" on the Mall parking lot. In addition, Sound Transit has plans (i) to use the Mall site for construction staging for the Northgate Station from 2016-2019, (ii) to temporarily take the

traffic conditions near the station is not necessary as part of the Lynnwood Link Extension.

B-007-006

Appendix H in the Final EIS lists the King County TOD project as part of the set of projects considered for long term and construction cumulative effects. Individual environmental topics also have added discussion where relevant, including in transportation (Chapter 3) and Land Use (Chapter 4, Section 4.2). If construction for the Northgate Link Extension and Lynnwood Link Extension overlap, Sound Transit will coordinate the separate projects to minimize traffic impacts during construction, as described in Section 3.6.9 of the Final EIS. The Lynnwood Link Extension is not proposing additional parking in the Northgate area, and because the King County TOD is not a Sound Transit project, Sound Transit is not responsible for addressing impacts of that project, whether or not Lynnwood Link is constructed. The King County TOD project remains conceptual at this point, and with its elements or construction timing yet to be determined.

B-007-007

The indication of a construction staging area within the mall property in Figure 6-1 of the Transportation Technical Report is primarily related to the Northgate Link Extension, but Sound Transit is working with Simon Properties to allow the site to be used for an early element of Lynnwood Link Extension, which should help reduce overall construction durations for the two projects in this area. Parking impacts associated with Northgate Link Extension construction and operation are addressed in the Final SEIS and ROD for the Northgate Link Extension (known as North Link at the time of the Final SEIS).

B-007-007 parking lot at the southeast corner of the Mall site and apparently use it to mitigate Sound Transit's parking impacts during the Maple Leaf portal construction, and (iii) to permanently take a portion of the Mall parking lot on the southwest corner of the Mall site in order to build a Sound Transit/Metro park-and-ride garage so as to facilitate Metro's TOD plans. These actions could reduce the Mall's total private parking by 15% to 20% when overlapped, and create real and enduring parking problems in the area for the Mall and its neighbors, for years. This is not "temporary" from the Mall's perspective. And, it will exacerbate the existing "Hide and Ride" problems for all of the local area residents.

B-007-008 Further, it appears possible that as part of the pending Northgate Station construction effort, Sound Transit may also attempt to close off one of four key access points off of 1st Avenue to the Shopping Center (105th private) for some portion of the suggested 40 month utilization of the Mall site for this temporary Northgate Station construction staging. The traffic impacts associated with the removal of access from the Mall's most heavily utilized parking fields, for several months, rerouting customers from the most heavily used parking fields on the west side back around to the 5th Avenue lots, and transporting the primary customer traffic that arrives from I-5 around on the adjacent streets to account for these significant changes during construction, have not been properly analyzed. This will be further exacerbated if the Lynnwood Link or King County TOD work overlaps, do not adequately account for cumulative parking and traffic pattern changes that ultimately push those burdens on the Mall, or both. The secondary neighboring streets are not designed to handle these burdens, so again there will be burdens not just on the Mall, but its neighbors.

B-007-009 Access to the Mall, particularly to and from I-5 and particularly on the western side, are the most important elements of the Mall's customers' means to reach the Mall and the adjacent freeway interchange that serves the larger Northgate Neighborhood and business district. Peak directional flows at this interchange system operate at or near capacity during peak weekday and weekend periods. This interchange also serves as the first access/last terminus for local connection onto the reversible I-5 Express Lanes. As a result, added pressure onto local arterials is generated along 1st Avenue NE, 103rd Avenue NE, and NE Northgate Way. Moreover, regular freeway congestion along the I-5 corridor occurs on a consistent basis, and regional traffic spillover already regularly utilizes these arterials that serve as the primary Mall access. A recent collision at the I-5 northbound off ramp that closed a single lane on 1st Avenue NE indirectly sent traffic for hours "through Mall property", essentially stopping and blocking traffic flow within the Mall interior drive aisles for hours as drivers diverted around congested roadways.

The Mall's primary trade area of regular shoppers (from which 70% of its retailers' sales are generated) extends south as far as Lake Union and Westlake, and north to the King County/Snohomish County Line. The Northgate/I-5 off-ramp is the Mall's primary point of customer access for a significant majority of those customers coming northbound, given the already bottlenecked conditions at the Northgate Way/I-5 underpass, and the lack of any significant east-west routes over/under I-5 to the south.

B-007-008

This specific proposal is not an element of the Lynnwood Link Extension. Responses above address Sound Transit's approach and commitments to coordination construction period planning that would occur regardless of details of any of the other projects or activities in the area.

B-007-009

Sound Transit recognizes the importance of the I-5 ramps and 1st Avenue as access points for the Northgate District as well as for the mall and its patrons. The Draft and Final EIS and the Transportation Technical Report all indicate the Northgate/I-5 off-ramp experiences high levels of congestion and delays, and predict increasing levels of congestion through 2035. The continued congestion on major highways and local streets is among the reasons light rail is to be developed in this area, particularly as the Northgate District continues to absorb growth and development as a regional growth center defined in regional and city plans.

B-007-010 Construction impacts are not just related to interruption or alteration of existing roadways, access or circulation. One also needs to factor in the construction activities, and the vehicles/equipment used for construction, and their added burden to the adjacent roadway network. The DEIS does not provide any information regarding the size or timeframe of the proposed construction staging nor the duration and intensity of use of the truck haul routes to and from the Mall, so from the existing DEIS it is not possible to meaningfully understand the extent of these impacts. The

B-007-011 DEIS also fails to analyze the cumulative impacts of the foregoing when combined with the Northgate Link station and guideway construction and construction of the park-and-ride garage, nor for the potential construction of King County's TOD plans immediately to the south of the Mall. Currently, the Sound Transit/Metro garage is proposed for construction in or around 2014/2015, the Northgate Station construction staging is proposed to occur from 2016 to 2019 on the Mall site, and the Lynnwood Link construction is proposed to occur from 2018-2023. The potential timing of the King County TOD is unclear, but representations have been made that suggest several hundred units might possibly be complete by the time Northgate Station is open. If not coordinated, continuous and possibly conflicting construction on the Mall site could occur from 2014 through 2023, a 10-year period, impacting vehicular/pedestrian access, freeway interchanges, and parking facilities and availability for both the Mall and its neighbors. The Mall requests that a focused comprehensive study of these issues be undertaken to ensure that traffic circulation is maintained, public or TOD parking impacts do not occur, and economic impacts to Mall tenants and their employees are minimized as a result of these cumulative impacts expected to result.

B-007-012 It is important to understand that for regional destinations such as Northgate, long-term, burdensome conditions are likely to permanently divert customers to alternatives. Getting these customers to come back once the public infrastructure projects are completed is not only not guaranteed, for many it is likely to permanently alter their shopping patterns. This phenomenon is well documented across America. Once a customer is alienated for any period, it is difficult to lure them back. The ability to keep the Mall occupied with quality retailers and dining options, as well as to maintain the quality and vibrancy of the Mall as a regional center, depends on that convenient and continuous access and availability of parking as they are currently accustomed to.

B-007-013 Sound Transit's FEIS should provide additional information and analysis of these issues, along with carefully considered alternatives for minimizing impacts that could permanently shift customer shopping patterns away from Northgate, given the duration of the combined impacts for the Projects, and their cumulative overlapping activities. Sound Transit should analyze how timing and coordination of construction for the Northgate Link and the Lynnwood Link can minimize impacts to the Mall, especially recognizing the potential TOD overlapping concerns.

III. Impacts to Mall Parking and Circulation.

B-007-014 As noted above, Sound Transit is proposing to use the parking lot on the western side of the Mall for construction staging for the Northgate Link. Given constraints on 1st Ave up to Northgate Way, it is reasonable to assume continued desire on Sound Transit's part to use of some Mall property for this purpose beyond the North Link project's construction timeframe. Moreover,

B-007-010

The Lynnwood Link Extension's Northgate area construction activities will primarily involve the construction of the elevated guideway. Therefore, the duration and intensity of the construction activities are expected to be about a year, less than what is needed for the Northgate Link Extension, which involves a tunnel portal, guideways, the station, the parking garage, guideways and tailtracks. Truck traffic to serve construction activities would also be less, with less need for spoils removal or fill, fewer materials, and fewer crossings of existing streets and roadways. The Draft EIS had a summary of activities, but deferred discussion of specific details to the Transportation Technical Report, which identified the types of activities including potential night-time periodic closures in the Northgate area on pages 6-10 to 6-19. Additional discussion is now included in the Final EIS in Chapter 3, and updated information is in the Transportation Technical Report.

B-007-011

Using the general construction and project development period for the Lynnwood Link Extension (or the Northgate Link Extension) does not accurately reflect the duration of construction activities with the potential for higher construction period traffic impacts. As page 2-27 of the Draft EIS notes, in any given location, heavy civil construction is expected to be completed within one to two years. Construction of elevated sections of the guideway would be staged to minimize major traffic impacts, with most closures or detours occurring at night. Depending on a contractor's approach to staging, the guideway segment could be placed within 3 months of relatively continuous work, or 6 to 12 months of intermittent work. Therefore, there is not a high potential for the Lynnwood Link Extension to create higher cumulative construction effects than those already identified for the projects individually, and a continuous ten or more years of heavy construction adversely affecting access to the Northgate area is not expected considering the projects in the area. The Transportation Technical Report gives further detail on likely sequencing

B-007-014 Sound Transit is proposing to permanently take the parking area on the southwest corner of the Mall site to build a Sound Transit/Metro garage. The DEIS does not include sufficient information to understand the scope of the parking impacts from the Lynnwood Link construction staging, nor the cumulative impacts of the Northgate Link, Lynnwood Link and Metro TOD plans.

Additional information and analysis should be provided, along with alternatives for minimizing parking and circulation impacts. In particular, as discussed above, Sound Transit should analyze how timing and coordination of construction for the Northgate Link and the Lynnwood Link can minimize impacts to the Mall, factoring in realistic assumptions for King County's TOD prospects.

IV. Hide and Ride.

B-007-015 Currently, the King County-Metro transit center is located south of NE 103rd Street, immediately south of the Mall. Surface and structured parking is heavily used in close proximity to this facility, as commuters limit their parking desire to the shortest walking distance. Relocation and expansion of the major transit access points further north to include the Mall and adjacent property will significantly increase the likelihood of commuters using the private surface parking lots of the Mall for "hide-and-ride".[1] This happens routinely in Simon centers, including at its Stoneridge Mall in Pleasanton with the new BART station (completed 2011) abutting that mall. With added pressure during construction of the Northgate Station, the proposed Sound Transit parking garage, extension of Link north along 1st Avenue NE, and King County TOD all generating additional demand or displacing existing supply within the Mall, and with new demand generated by Lynnwood Link trips, parking demand impacts on the Mall should be considered in a cumulative and comprehensive manner. During each stage of construction, upon completion of the Northgate Station and line but prior to Lynnwood being operational, and thence forward.

Given understating of parking demands during the critical construction period windows (when Sound Transit currently anticipates reducing the Mall parking supply for many years to build facilities on and adjacent to Mall property), and perhaps most acutely once Northgate Station is open, but the Lynnwood extension is not complete, several years of continuous loss of parking is likely to affect Mall retailers' ability to be successful absent mitigation of impacts to what is already a very tight parking arrangement at Northgate Mall. The Mall is at the low end of parking requirements for regional malls in suburban settings. The Mall and its tenants cannot afford for inadequate commuter parking to make what is already going to be a challenging

[1] In addition to "hide and ride" parking, similar activity and impacts to the Mall result from other public facilities located nearby. For example, on August 20, 2013, from 5:30 pm - 8:00 pm, Sound Transit held an open house/public hearing on the DEIS at the Northgate Community Center Gymnasium at 10510 5th Ave NE, Seattle (corner of 105th and 5th Ave. NE, adjacent to Northgate Mall). The lot was full before the meeting started. Therefore, members of the public who did not simply give up in frustration parked in the private Mall parking lot closest to the community center to reach the open house meeting, or in the residential neighborhood to the south.

by area to help support the finding that construction impacts can be managed to avoid severe impacts.

As noted above, Sound Transit's construction period mitigation commitments will include coordinating planning with other projects as well as with stakeholders, the City and WSDOT, which would further reduce potential construction impacts for individual projects as well as potential cumulative or sequential projects. As part of final design for the Northgate Link Extension, Sound Transit has continued to develop details of the construction sequencing and phasing.

B-007-012

Sound Transit recognizes the concerns of the Mall in retaining its customer base. The construction planning and mitigation approach for the project includes a commitment to maintain effective access to the mall and to parking to reduce the potential for impacts to the long term customer base of the mall. In addition, the long-term presence of the light rail line near the mall and the high visibility and accessibility of the mall for Sound Transit riders has the potential to attract customers to the mall.

Measures identified in Section 4.3.6 (Economic Impact Mitigation) of the Final EIS describes communication, marketing and promotional measures Sound Transit would implement with businesses and business districts to minimize impacts. This would include working with Simon Properties to publicize that businesses are open during construction, and to develop signage and wayfinding systems for the construction period.

B-007-013

The Final EIS includes additional discussion clarifying the areas of potential construction overlap with the other projects noted in your letter, and also has further detail on the types of construction activities by location for the Lynnwood Link Extension. However, many of the

B-007-015 situation worse. Yet, these unmitigated public spill-over public parking impacts are going to occur for a number of years as these overlapping Projects proceed.
Simon and its retailers are highly motivated to help Sound Transit make sure they do not experience the negative consequences that Simon tenants in other "transit project-proximate" locations already experienced elsewhere. And one can look at the current conditions, where commuters fill up virtually all of the close park-and-ride lots, and then park on Mall property, and fill up most of the surface streets surrounding the existing Northgate Transit Center most weekdays, to know that significant anticipated increases in utilization of public transit here will undoubtedly not result in reduced parking demand. It is incumbent upon Sound Transit's environmental analysis to compare current "boardings" of transit systems to anticipated future boardings, identify how many of those incremental boardings are likely to come from automobiles, and properly plan to accommodate them without burdening the Mall and surrounding streets and neighborhoods. This needs to be looked at for each step in the process of transitioning the area surrounding Northgate Station, up until Lynnwood is open and operating, and relieving this community of the likely peak parking demand as the end node of the system until that new link is open and operational.

V. Impacts to Visibility from I-5.

B-007-016 The Northgate Station, the Northgate and Lynnwood guideway, and the Sound Transit garage will all impact visibility of the Mall from I-5 and to some degree 1st Avenue NE. The DEIS states that "Views of Northgate Mall from I-5 would not be impaired." DEIS at Table 4.5-1 (Summary of Potential Visual Quality Impacts of the Light Rail Alternatives). That statement is factually incorrect, particularly when considering the cumulative visibility impacts of the Lynnwood Link, the Northgate Station and Link, the proposal for a Sound Transit/Metro garage on the southwest corner of the Mall site, and the King County Northgate TOD plans. The DEIS should correct this inaccuracy and analyze and address how visibility impacts might be minimized, such as by providing temporary or new permanent replacement signage for the Mall, or otherwise compensating for such impacts. Though Northgate Mall generates a good deal of business from the local community, the reality is Northgate Mall, as with most shopping malls of this kind, generates customer traffic primarily from a much broader clientele. In the Mall's case via the freeway system up to the King County line, and as far down as U Village and Westlake. The Mall's trade area of regular shoppers has a population base of close to 500,000 people. And thus visibility and awareness from that broad audience is critical to the Mall retailers' success.

VI. Traffic Impacts on Roads and Arterials Surrounding the Mall.

B-007-017 The DEIS Transportation Technical Report (July 2013) recognizes that arterial and local street impacts would be highest at stations that provide the greatest number of park-and-ride access opportunities. This review however, does not consider the impacts (increase or decrease) in those specific types of traffic impacts relative to the Northgate Link station area, nor the cumulative impacts that could very likely be experienced with overlapping construction activities. As noted above, these specific impacts should be included in a "focused" Northgate Station Area Traffic and Parking Impact Study. This study would address short-term,

mitigation measures already defined in the Draft EIS and that now accompany the Preferred Alternative in the Final EIS are designed to address the stated concerns over construction and potential impacts to business and economic activity in the Northgate district. This includes a commitment to coordinate construction planning and mitigation with other projects.

B-007-014

Northgate Link Extension has been discussing with Simon Properties the use of the southwest corner of the Mall site for construction staging and guideway construction. Impacts related to displaced parking supply are being addressed by Sound Transit as part of the Northgate Link Extension.

Figure 6-1 of the Transportation Technical Report indicated a construction staging area in the mall lot based on preliminary plans; the Final EIS has updated conceptual design plans for construction staging, which supercedes the figures that were used in the technical report, but still shows the edge of the property being potentially used. Construction staging planning is still in early stages, and the areas to be used would depend on final design details as well as property availability, including both public and private properties. The Draft EIS for the Lynnwood Link Extension identified the mall property as being affected by partial acquisition in Section 4.1, Acquisitions, and Appendix I-4.1, and includes conceptual plans in Appendix F that show the potential for parking stalls on the far west edge of the lot to be impacted in order to construct structural supports for the guideway as it crosses to the west side of 1st Avenue NE. The Final EIS updates that information for the Preferred Alternative. The number of potentially affected spaces is small (less than 20) compared to the overall supply available at the mall, and the EIS identifies measures to mitigate any loss of parking on private property (primarily compensation when the amount of displaced parking is small).

B-007-017 intermediate, and long-term traffic and parking impacts to the Mall and the I-5 Northgate area freeway interchange system and local arterial system. This type of study will be especially vital in the evaluation of construction impacts, that include construction staging, Mall access closures, temporary parking impacts, etc. And it should be able to help identify upfront traffic mitigation efforts that can partially mitigate for the impacts during years of construction, before the area is finally free from construction related impacts in the 2021 thru 2024 years, as best as the Mall can foresee. Anticipated TOD densities and timing will also need to be factored into the analysis.

VII. Alternatives.

B-007-018 The DEIS also fails to take a hard, fair look at reasonable alternatives. Given the direct, indirect and cumulative, and enduring, adverse environmental impacts the light rail and TOD plans would create, this analysis should not be piecemealed, but rather should carefully assess impacts and alternatives across all of these "segments" of Sound Transit's proposal.

B-007-019
- Sound Transit currently plans to condemn a portion of the Mall land, and to construct the replacement parking for the King County Metro park-and-ride patrons in a parking structure on the Mall's property. Given the burdens the Mall and its retailers and customers are already going to shoulder for a decade during coincident construction of rail facilities, the multi-modal transit station and the TOD project contemplated, the Mall recommends that Sound Transit reconsider, and fully analyze, the placement of the Northgate park-and-ride facility on the King County Metro TOD site (similar to the preferred alternative in the Northgate FEIS (2006)). Simon further recommends that such an alternative consider the scope and timing of the otherwise intensive TOD project (and coordinate Sound Transit plans with Mall plans to build its own garage to mitigate the Projects' parking impacts during Sound Transit's construction staging on the Mall site).

B-007-020
- The Mall recognizes that its site will be used as laydown for construction staging for the Northgate extension project, but it is not clear if that "need" extends further into the future with the proposed Lynnwood project. Given the tight physical constraints between I-5 and 1st Street as one approaches a heavily congested Northgate Way interchange, the Mall and its tenants would like to understand whether Sound Transit anticipates using the Mall further for additional laydown as part of the construction of the Lynnwood Extension. In that regard, Simon's representatives were advised that that was a distinct possibility during Sound Transit's Northgate open house. Simon requests that the need, scope and extent of any additional laydown be clarified and analyzed.

B-007-021
- For the long term, it is clear that moving the planned park-and-ride garage to the current Transit Center site would reduce traffic impacts/conflicts with the 500,000 person population in the Mall trade area that is driving to Northgate to shop, and result in less pressure for "hide and ride" that would impact the Mall's available parking for Mall patrons, as well as its retailers success and its neighbors' parking options and residential neighborhood ambiance.

B-007-015

The Northgate Link Extension project is proposing the use of the southwest corner of the mall parking lot, and impacts related to displaced parking supply as well as the potential for managing potential hide-and-ride effects, are being addressed by Sound Transit as part of that project, consistent with the North Link Final SEIS and that project's Record of Decision. The Final EIS and the Transportation Technical Report for the Lynnwood Link Extension have further detail about construction staging and sequencing in the Northgate area, and describe both the types of activities, the timing, and the nature of construction staging areas, which are generally west of 1st Avenue. In addition, the Transportation Technical Report and Chapter 3 of the Final EIS both indicate that ridership at the Northgate Station would be lower after the Lynnwood Link Extension opens, which would reduce the potential for transit-related traffic and parking impacts around the Northgate station.

B-007-016

The conclusions in the Draft EIS, with the visual simulation in Figure G-3, shows that views would not be impaired because the prominent buildings within the mall would continue to be visible above the elevated guideway. The elevation of I-5 slopes down from south to north from an elevation of about 310 feet at NE 92nd Street to an elevation of about 270 feet at NE 100th Street and continues at that level until it begins to climb again at about 310 feet at Northgate Way. The buildings of the Northgate Mall are at an elevation of about 300 feet. Parking lots slope to the west and south to about 280 feet. Vegetation along I-5 and the canopy of trees in the parking areas screen the lower portions of the mall buildings from most of I-5, however the mall is still a prominent landmark because of the visibility of upper floors of buildings. The light rail guideway is generally at an elevation of 325 feet. As shown in Figure G-3 (at about NE 97th at an I-5 elevation of about 284 feet) the guideway obscures the lower elevations of buildings. The upper portions of buildings and the general presence of the features of the mall are still

Conclusion

B-007-022 For the foregoing reasons, Simon requests that the FEIS fully assess the cumulative impacts and effects of the North Link, the Lynnwood Link, and the King County TOD proposal, particularly in light of the existing infrastructure deficiencies in the area around the Mall. When viewed together, it is clear that the impacts to the Mall and its neighbors will be substantial during the extended 10+ year construction period, and that the final result will be dramatic parking and traffic impacts, and associated damage to the economic vibrancy of the Mall and its business neighbors, as well as the livability of the Mall's neighboring residential areas. We look forward to working with Sound Transit (and King County) staff to help avoid, reduce and mitigate these impacts, with the goal of helping to make the North Link and Lynnwood Link the successes the public is hoping for.

Very truly yours,

R. Gerard Lutz

cc: Charles W. Davis, Jr., Sr. Vice President Development - West, Simon Property Group

87429-0001/LEGAL27850949.3

clearly visible. As I-5 slopes downward to the north, views of mall from northbound traffic are increasingly obscured by retained vegetation along I-5 and tree canopy in parking lots. Southbound traffic north of Northgate Way has few views of the mall because the roadway curves to the east and views from vehicles are oriented to the southwest. South of Northgate Way, views of the mall are out of the line of sight of drivers. Passengers can see major features of the mall by looking sideways. The elevated portions of the light rail guideway rise from an elevation of about 310 feet to about 325 feet between 107th Street and Northgate Way and are above the level of the base of the mall, but is still below the level of the tree canopy in the mall parking lots. The upper levels of buildings are still visible. Occupants of vehicles on I-5 have extensive views of complex urban development on both sides of I-5 and of the upper portions of buildings, including the mall. The presence of the mall and other development remains the dominant feature in views from the road. The portion of the guideway shown in Figure G-3 is part of the Northgate Link Extension south of the current project, and therefore illustrates the cumulative impacts of both projects. This figure also shows the existing parking structures. Proposed station impacts were analyzed in the Sound Transit North Link Final EIS on pages 4-54 and are illustrated in Appendix P4.4 View Location 1.

B-007-017

As noted in responses above, the Final EIS and the Transportation Technical Report provide more detail on construction and how the Lynnwood Link Extension would reduce the demand for transit-related trips at the Northgate Station, compared to No Build. Therefore, a detailed assessment of traffic conditions in Northgate, in addition to the more detailed analysis conducted for the Northgate Link Extension would not be needed to confirm that the Lynnwood Link Extension would not increase traffic impacts compared to the Northgate Extension alone.

B-007-018

The alternatives in the Lynnwood Link Extension EIS assess the potential impacts of a project defined as providing an extension of mass transit from Northgate to Lynnwood. The Northgate Link Extension and the Lynnwood Link Extension are separate projects, with the Northgate Link Extension being part of previous decisions, environmental reviews and funding commitments that have allowed the Central Link system to be built for the corridor connecting SeaTac to Northgate. Potential refinements to the Northgate Link Extension are not being considered as part of the Lynnwood Link Extension. However, as Sound Transit continues to complete final design for the terminus of the Northgate Link Extension, the agency is coordinating with Simon Properties, the City, King County Metro and others to address the concerns that your letter identifies.

In addition, the Lynnwood Link Extension EIS identifies actions that are related to the connections between other projects as indirect, secondary or cumulative. In this way, Sound Transit has evaluated the potential for significant environmental impacts arising as a result of the Lynnwood Link Extension, whether it arises directly from the project or whether it would occur as part of other reasonably foreseeable activities in the area. This discussion is found in the Final EIS in Chapter 4 for each resource evaluated, and mitigation measures to address cumulative effects are identified in the Final EIS.

B-007-019

For the Northgate Extension, Sound Transit has coordinated the project's final design planning with Simon Property Group and King County Metro to confirm the location of the park and ride facility at Northgate Station. The areas that were considered would not be directly affected by the construction of alternatives being considered for the Lynnwood Link Extension. Sound Transit has also entered discussions with Simon Property Group about the use of an area within the west part of the mall

parking for construction staging for the guideway north of the Northgate Station. Depending on the final outcome of those discussions and negotiations, the Lynnwood Link Extension could propose using this area for construction staging.

B-007-020

Sound Transit generally plans to maintain construction staging along the Segment A alignment within the proposed guideway, stations, and other available rights-of-way. Properties proposed for permanent acquisition or that are available for lease are also often considered for contruction staging. Appendix F of the Final EIS updates the areas that Sound Transit expects to utilize for construction activities, which includes the western edge of the parking lot to the mall where the guideway would begin before crossing over to the west side of 1st Avenue. As you know, Sound Transit has been in discussions with Simon Properties for this area as part of the Northgate project as well. As part of coordinating construction for both projects, Sound Transit is also considering opportunities to combine some aspects of construction of the projects into a single construction period to help reduce overall impacts.

B-007-021

This issue is related to the Northgate Link Extension and King County's Transit-Oriented Development project, and is not related to the decisions being made for the Lynnwood Link Extension.

B-007-022

In the Final EIS and in responses to this letter's individual comments, Sound Transit has added further information describing the relationship between the Lynnwood Link Extension to Northgate Link Extension, and the King County TOD project. This includes further information showing that the potential combined construction periods would not involve more

than 10 years of intensive activities that would not be addressed by mitigation measures already in place in the Lynnwood Link Extension and North Link EIS documents, that the Lynnwood Link Extension would have a more limited range and duration of construction activities, generally north and west of the mall property, and also demonstrating that the Lynnwood Link Extension would reduce the potential for long term traffic and parking impacts in the district.

Sound Transit remains committed to working with Simon Properties, the City of Seattle, King County and others as final design and construction continues on Northgate Link Extension, and as the County ultimately advances its TOD project.

Re: Sound Transit – Lynnwood Link Extension

Dear Sound Transit

I would like to provide my thoughts and comments about the proposed options for the Lynnwood Link. It is my sincere hope that Sound Transit will support Option C-3 or the newly proposed Option C-4 as opposed to Options C-1 or C-2.

B-008-001 I am the owner of a three story office 72,000 s.f. Class "A" office building located on 20311 52nd Avenue in Lynnwood, just north of the Edmonds School District Property. I also own two other adjacent properties and have plans on those properties for an additional 50,000 s.f. of office to be developed in the near future. I have attached a map showing the location of the building and a picture showing the building.

My building is leased to the State of Washington and houses a number of agencies including DSHS (Department of Social and Health Services) and DCFS (Department of Children and Family Services) that provide valuable services to the Lynnwood and South Snohomish County communities. Many of the roughly 250 people that work in the building live in the Lynnwood area and they, and the many visitors to the building, shop at local Lynnwood businesses during their work week. If Route C-1 or C-2 is chosen it will negatively impact valuable community services both during and after construction as well as have a negative effect on local Lynnwood businesses. These people and their many clients in the community will suffer. If C-1 or C-2 is chosen it will hurt important State services and the effect on the buildings and plans for the property will be significant.

If C-1 or C-2 is selected homes and businesses will be destroyed, parks and pristine wetlands will be damaged, companies and residents will be displaced. There will be significant negative effects on the environment including water, air, soil, parklands, noise, ecosystems, vegetation and wildlife. The construction alone will take years in which time the entire area which is residential as well as commercial will be effected. How can that make sense when other options closer to Interstate Five with

B-008-002 lower impacts on residents and business are available. I would also be surprised if options C-1 and C-2 are not far more expensive than either C-3 or C-4. I know that Sound Transit provides estimates of the impact of each option to the City and Community but do these studies include the possible economic loss to Lynnwood's businesses if tenants move away and businesses are forced to close from options C-1 and C-2. I would hope that Sound Transit will consider these ramifications before making its choice.

B-008-003 It appears that the Lynnwood City Council has in the past favored option C-1 as opposed to option C-3. Staff reports present that the C-1 alignment "might be" more favorable for the proposed City Center project than the C-3 alignment. If the City Center project happens it will likely be many, many years from

1

B-008-001

Thank you for identifying your concerns about your building and the potential impacts to businesses and operations it houses, as well as to other residences, businesses, and employees along the Alternatives C1 and C2 alignments. While these alternatives would acquire properties and displace businesses and operations, requiring their relocation, the mitigation measures identified in Section 4.1 (Acquisitions, Displacements and Relocations), as well as in Section 4.3 (Economics), would offset many of the impacts. Sound Transit would also work closely with tenants, including any affected service agencies, to ensure that their services would continue to be available during any relocation process. While these and other mitigation measures are available for those alternatives to reduce impacts, some impacts would be unavoidable, and the alternatives indeed vary in terms of which properties and parties would be affected. Still, larger scale impacts to the overall area are not likely, because access to the surrounding area and properties would be maintained throughout construction.

Following the Draft EIS, Sound Transit received a considerable number of other comments voicing similar concerns about Alternatives C1 and C2. The Sound Transit Board has identified a modified Alternative C3 as the Preferred Alternative in the Final EIS. If this alternative is selected for construction, then the property impacts along 52nd Avenue W would be avoided. Again, the Draft EIS and the Final EIS both identify mitigation measures to help reduce the severity of the impacts, and some of the areas of impact that are noted in your comment (water, air, soil, vegetation, and wildlife, for example) would not result in adverse effects to the environment after mitigation has been applied.

B-008-002

The Final EIS provides cost estimate comparisons for all the alternatives in Chapter 5. The Segment C alternatives have similar cost ranges. The Draft EIS and Final EIS do not analyze an Alternative C4, but the Final

B-008-003

now. Locating the Lynnwood Link at locations C-1 or C-2 will cause real harm to the City now. It seems shocking that responsible City leaders could choose to impact a significant number of residents, citizens and businesses now for some potential uncertain gain that "might" occur many years from now. I would hope that Sound Transit would carefully look at any disadvantages of C-3. A case could be made that C-3 will make the City Center buildings more valuable since the elevated rail would provide visibility to the buildings in the City Center blocks effected in the same way as the Monorail does in downtown Seattle. Any potential future harm from C-3 is at best speculative, C-1 and C-2 on the other hand will cause real harm to the City now.

I am encouraged that the City of Lynnwood and Sound Transit is now considering a new option C-4. This option does not damage existing businesses and residences in the way that C-1 and C-2 does and it appears that the alignment might not affect the City Center Block in question. Selecting C-1 or C-2 will hurt Lynwood, the community, valuable State services and the area in general. A choice of C-3 or C-4 makes sense and is good for the community.

Thank you for the opportunity to provide thoughts on this important decision.

Michael Raskin

EIS does include a Modified Alternative C3, which is similar to an option proposed by the City of Lynnwood. As discussed in Section 4.3, Economics, of the Draft and Final EIS, Sound Transit does evaluate the economic effects of the alternatives, including loss of property tax revenue, and the section also considers the potential for other types of effects occurring during construction or operation.

B-008-003

Thank you for your comments regarding near-term conditions and impacts of the alternatives, compared to the longer range goals to develop Lynnwood's City Center area. Please see the Final EIS for updated analyses of the alternatives, including the modified Alternative C3.

Subject: Lynnwood Link - Scriber Creek Park - 875 Signatures anti Alternative C-1

FYI: The following petition was signed this past week by **875** people. We will continue getting signatures through the September 23 deadline and will be present at every community meeting.

Petition

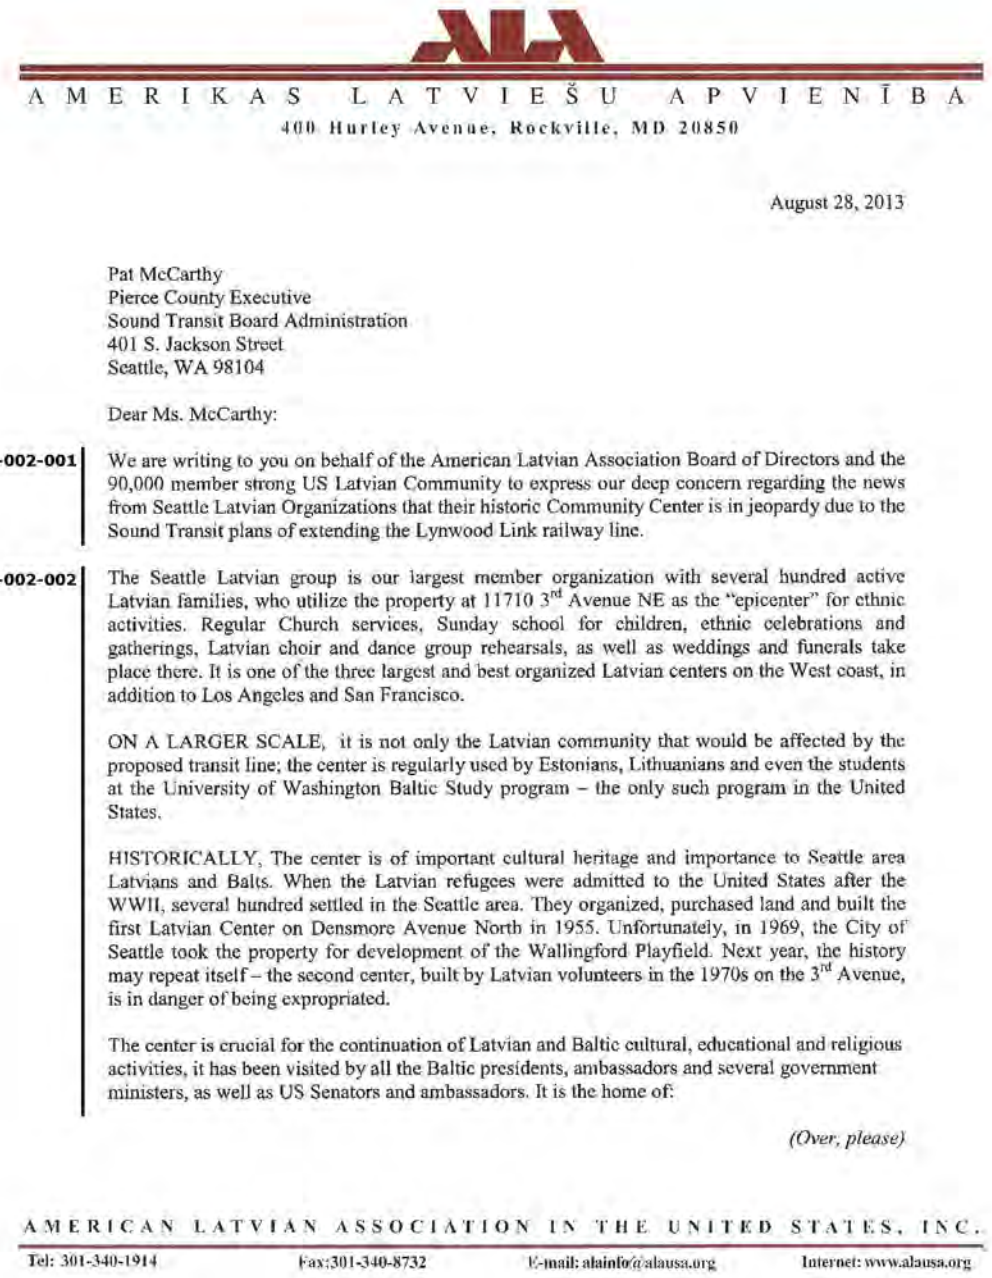
Save Scriber Creek Park – No on Alternative C-1

C-001-001 The signers of this petition are opposed to Alternative C-1 route for the Sound Transit Link Light Rail Lynnwood Extension because this alternative would have the most significant negative environmental impacts to Scriber Creek Park and its associated forested wetlands and wildlife habitat and quality of life of the residents in the area.

2

C-001-001

Sound Transit acknowledges your opposition to Alternative C1 due to its residential impacts and impacts to Scriber Creek Park and wetlands.



AMERIKAS LATVIEŠU APVIENĪBA
400 Hurley Avenue, Rockville, MD 20850

August 28, 2013

Pat McCarthy
Pierce County Executive
Sound Transit Board Administration
401 S. Jackson Street
Seattle, WA 98104

Dear Ms. McCarthy:

C-002-001 We are writing to you on behalf of the American Latvian Association Board of Directors and the 90,000 member strong US Latvian Community to express our deep concern regarding the news from Seattle Latvian Organizations that their historic Community Center is in jeopardy due to the Sound Transit plans of extending the Lynwood Link railway line.

C-002-002 The Seattle Latvian group is our largest member organization with several hundred active Latvian families, who utilize the property at 11710 3rd Avenue NE as the "epicenter" for ethnic activities. Regular Church services, Sunday school for children, ethnic celebrations and gatherings, Latvian choir and dance group rehearsals, as well as weddings and funerals take place there. It is one of the three largest and best organized Latvian centers on the West coast, in addition to Los Angeles and San Francisco.

ON A LARGER SCALE, it is not only the Latvian community that would be affected by the proposed transit line; the center is regularly used by Estonians, Lithuanians and even the students at the University of Washington Baltic Study program – the only such program in the United States.

HISTORICALLY, The center is of important cultural heritage and importance to Seattle area Latvians and Balts. When the Latvian refugees were admitted to the United States after the WWII, several hundred settled in the Seattle area. They organized, purchased land and built the first Latvian Center on Densmore Avenue North in 1955. Unfortunately, in 1969, the City of Seattle took the property for development of the Wallingford Playfield. Next year, the history may repeat itself – the second center, built by Latvian volunteers in the 1970s on the 3rd Avenue, is in danger of being expropriated.

The center is crucial for the continuation of Latvian and Baltic cultural, educational and religious activities, it has been visited by all the Baltic presidents, ambassadors and several government ministers, as well as US Senators and ambassadors. It is the home of:

(Over, please)

AMERICAN LATVIAN ASSOCIATION IN THE UNITED STATES, INC.

C-002-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

C-002-002

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Please see Section 2.5.1 for a description of the refined Segment A alternatives that avoid displacing the Church.

C-002-002

- Seattle Latvian Evangelical Lutheran Church, established in 1950
- Washington State Latvian Association, established in 1949
- Seattle Latvian School, established in 1950
- Latvian Folk dance group "Trejdeksnītis", established in 1962
- Seattle Latvian Choir
- Seattle Latvian Library
- Latvian student fraternities and sororities
- Latvian Seniors' club.

IN ADDITION, it is the place for one of the 15 polling centers in the United States organized by the Latvian government and the American Latvian Association for Seattle area Latvian citizens to cast their ballots in Latvia's National Elections.

Please keep Seattle diverse! Do not allow the proposed transit line destroy the Latvian Center! If we lose this site, we lose more than a building, and we fear that the local Latvian community will not have the means, manpower and moral strength to rebuild their center for the third time!

Sincerely,

Anita Batarags

Draft EOS Comments c/o Lauren Swift
401 S. Jackson St.
Seattle WA 98104

Re: Impact on Seattle Latvian Cultural Center

C-003-001 The Bellevue Sister Cities Association, Liepaja, Latvia Committee would like to add its concern to those questioning the present alternatives for the Lynnwood Link Extension DEIS and the serious impact it will have on further use of the Seattle Latvian Cultural Center.

The Seattle Latvian Cultural Center is a focal place, not only for those of Latvian background living in Seattle, but for all of us in the Pacific NW. The Latvian Association was a strong supporter back in 1992 when Liepaja, Latvia became one of Bellevue's sister cities, support that has continued throughout the past twenty years. The Latvian Cultural Center has been the venue for many of our social and informational as well as our fundraising events during this time. We are concerned that the present plans would greatly affect the use of this facility, a huge loss to us, as well as to the many other organizations that use it on a regular basis.

We hope that you will take this into consideration and provide for access to the Seattle Latvian Cultural Center so it can continue as a gathering place for the many people and organizations that presently use it.

Sincerely,

Inta B. Gotelli, BSCA treasurer
Liepaja Committee

cc. Hugh Burleson, BSCA president

C-003-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Sound Transit
Draft EIS comments
c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

Dear Members of the Sound Transit Board,

C-005-001 I am writing to you in hopes of helping convey a strong message in support of preserving the Latvian Community Church and Meeting Hall located at 11710 – 3rd Ave. NE, Seattle, WA. It is my understanding that Sound Transit is considering possible routes through northeast Seattle which might impact the Latvian Hall.

C-005-002 As a member of the Seattle Estonian Community, the Latvian Hall represents as much of a "home" to our community as it does to Seattle-area Latvians as well as Lithuanians. As our community is smaller than the Latvian community, we have for decades rented the Latvian Hall as the centerpiece of our community meetings, holiday celebrations and cultural gatherings. The Latvian Hall has hosted visiting Estonian Presidents, members of Parliament and other dignitaries. It has also, on a personal note, naturally served as the site of my wedding in 2004, and hosted the funerals of my family members.

The Seattle Estonian community cherishes the Latvian Hall and our relationship with the Latvian and Lithuanian communities. The Latvian Hall is the foundation of that relationship and with its large auditorium, church and meeting rooms, it uniquely serves this purpose for our mutual use. The history we have shared over the decades within the walls of the Latvian Hall is immeasurable. During the Soviet occupation of the Baltic States, the Latvian Hall was a rallying place for legislative and political efforts in support of re-establishing independence in our homelands. Subsequent to the

C-005-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

C-005-002

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Please see Section 2.5.1 of the Final EIS for a description of the refined Segment A alternatives that avoid displacing the church.

Honorary Consul of the Republic of Estonia
in Seattle, Washington

C-005-002

culmination of those efforts, the Latvian Hall continues to bind our communities through co-hosted community celebrations, fundraisers and commemorations.

I simply cannot imagine a vibrant Estonian, Latvian or Lithuanian community existing in Seattle without the Latvian Hall. I implore you to preserve this most important foundation of our shared community.

Most sincerely,

Paul A. Raidna
Honorary Consul
Republic of Estonia

Draft EIS Comments
c/o Lauren Swift
401 Jackson Street
Seattle WA 98104

C-006-001

The 87 members of the Latvian Seniors' Association are deeply concerned that the proposed Lynnwood Link Extension may severely impact the Latvian Lutheran Church and Community Center buildings and access to them. Our organization has free use of the Community Center for its well-attended monthly meetings, which feature a substantial hot meal and a cultural program. We fear that any disruption of the availability of the facility, with its full kitchen and audio-visual support for presentations, will threaten the existence of our group due to lack of a convenient rent-free assembly place. This would constitute a severe emotional loss to our senior citizens.

Edvins Circenis
President

Member signatures:

C-006-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Please see Section 2.5.1 of the Final EIS for a description of the refined Segment A alternatives that avoid displacing the church.

North King County
MOBILITY COALITION

Mr. Perry Weinberg, Director
Office of Environmental Affairs and Sustainability
Sound Transit
401 South Jackson Street
Seattle, WA, 98104-2826

Dear Mr. Weinberg:

The North King County Mobility Coalition is comprised of agencies and individuals from North King County cities that share a concern for seniors, people with disabilities, youth, low-income households, and those with limited language skills who require access to public transportation. This letter is written to address their needs and concerns for the Lynnwood Link alternative.

C-007-001 Generally thorough and well-written, the DEIS puts its focus primarily on the needs of able-bodied commuters. It is not clear how Sound Transit will make the stations accessible to people with limited mobility. Page 3-14 states that sidewalks will meet ADA requirements. How far from the stations this will apply? The Coalition urges Sound Transit to support actions that assure the necessary upgrades occur in coordination with the opening of the line.

C-007-002 This may be complicated by the multi-jurisdictional ownership of NE 145th (WSDOT, the cities of Shoreline and Seattle, and King County) but the Coalition urges Sound Transit to work in collaboration with all owners to ensure that NE 145th meets the needs of nearby residents. Furthermore, the Coalition strongly supports better east/west transit connections for those who live in proximity, but not close enough to walk, to the LINK line. Our expectation is that Sound Transit will cooperate with Metro to make connecting buses interface well with the train.

C-007-003 The Coalition supports the selection of a station at NE 145th due to the amount of housing for special needs populations within one mile of the proposed station. This includes many residential sites owned by the King County Housing Authority (such as Paramount House) as well as several other apartment complexes that serve veterans, seniors, and people with disabilities. A station at 155th would put the train out of reach for most of these residents. Therefore, the Coalition favors Alternatives with a station at NE 145th, including Alternatives A1, A3, A10, and A11.

C-007-004 Finally, the Coalition is concerned that Sound Transit's public involvement efforts have not reached enough people with special transit needs. Page 4-63 states that the agency is obliged to reach out to people with limited access. However, the meetings described in the DEIS to discuss the Lynnwood extension seemed to have been oriented toward people with cars. In our experience, outreach to special needs communities is most effective when taken to the community rather than expecting the community to travel to a meeting space. Therefore, Sound Transit should plan for more community-based outreach, especially to special-needs populations.

C-007-005 In summary, the Coalition recommends three actions moving forward: 1) the selection of the NE 145th station; 2) increased cooperation with other transportation agencies and concerned local governments: and, 3) greater outreach to and input from special needs communities.

Thank you for the opportunity to comment on the Lynnwood LINK DEIS.

Sincerely,

Robin McClelland	Dori Gillam	James Seeks	Chris Eggen	Candace Ives
Coalition Member	Senior Services	Transportation Manager Northshore Senior Center	Deputy Mayor City of Shoreline	Resident Services Coordinator King County Housing Authority

14812 Main Street, Bellevue, WA 98007

C-007-001

Sound Transit will meet ADA standards for all of its facilities and projects, and a commitment for full access for all persons is an element of Sound Transit's adopted System Access Policy. Current designs for the project alternatives generally include new or rebuilt facilities to ADA standards for the station sites, to and from feeder bus stops and nearby intersections, and for any streets or other transportation facilities reconstructed or otherwise improved for the project. During final design, Sound Transit will also work with local jurisdictions on planning for access improvements for other facilities connecting to station areas.

C-007-002

Sound Transit will continue to work cooperatively with both Seattle and Shoreline to design a station that serves all users, including regional commuters and people coming to and from the surrounding neighborhoods. Sound Transit will coordinate with King County Metro to plan for changes in their transit service to support the station. Ultimately, route and service changes are determined by the local transit agency for the routes they operate.

C-007-003

Your preference for alternatives that include a station at NE 145th Street because it would be more easily accessible by those with special needs is noted.

C-007-004

As described in Chapter 6 Public Involvement and Agency Coordination, Sound Transit used a variety of outreach activities and methods to engage the community beginning at the early stage of alternatives analysis through the Draft EIS, and into identification of the Preferred Alternative and development of the Final EIS. For the Draft EIS, all of the sites for the public meetings were accessible by transit and were in

community facilities throughout the corridor. Activities and methods for public outreach included kiosks, community events, drop-in sessions, a project website, news media, fact sheets, brochures, newsletters, and an email subscription list.

C-007-005

Sound Transit will continue to coordinate with other transportation agencies, jurisdictions, and interested community organizations, including for people with special needs.

Seattle, WA 98104

RE: Lynnwood Link Extension DEIS Comments

Dear Ms. Swift,

Thank you for this opportunity to provide comments on the Lynnwood Link Extension Draft Environmental Impact Statement. I am writing on behalf of Futurewise, and our organization is a statewide public interest group working to promote healthy communities and cities while protecting farmland, forests and shorelines. Our Urban Program promotes a livable and sustainable region that can accommodate growth while providing necessary public amenities and a strong urban sense of place. Our primary objective is to promote policies for affordable, transit-oriented development in our region's urban centers and high-capacity transit areas.

We are excited about the Lynnwood extension as it will help provide convenient, reliable, economically and environmentally sustainable ways for our growing population to reach their jobs, homes and services.

Our overall priority to meet the goals of long term community health is to make station-area decisions that maximize the potential for ridership and meaningful Transit-Oriented Development (TOD). Successful TOD projects provide a rich array of amenities, housing and transportation choices in proximity to high-capacity transit. As a central strategy to accommodating growth *well* in our region, we believe this is critically important to system alignment and station siting decisions. Based on these priorities, our comments on the DEIS are as follows:

C-008-001

- We support Alternatives A10 or A11 for Segment A, with three stations at 130th, 145th and 185th. Maximizing potential ridership and long term TOD is the responsible decision for our regional growth. While TOD potential is currently less than optimal at the three station areas, we believe this will change over time and will be well worth the additional cost for the third station.
- Between NE 145th and NE 155th Street, we strongly support 145th due to greater proximity to a main thoroughfare, greater TOD potential, and better improvement options for accommodating multi-modal access to the station.

C-008-002

- Similar to Segment A, we support Alternative B2A in order to maximize our long term investment. The construction of two stations, Montlake Terrace Transit Center and 220th Street SW, will increase ridership and TOD potential.

816 Second Avenue, Suite 200 Seattle, WA 98104 www.futurewise.org phone 206 343 0681

C-008-001

Your preference for more stations, rather than fewer, is acknowledged. The Final EIS evaluates (as did the Draft EIS) three-station Alternatives A10 and A11. The Sound Transit Board will select the project to be built after the publication of the Final EIS. The Preferred Alternative includes the general alignment and stations of Alternative A1, and the Final EIS also reviews options for a future station at NE 130th Street.

C-008-002

In addition to Alternative B2A, the Final EIS evaluates the Preferred Alternative, as identified by the Sound Transit Board. The Sound Transit Board identified a modified Alternative B2 as the Preferred Alternative, which includes a station at the Mountlake Transit Center. The Sound Transit Board also directed further study of options to add a station at 220th Street SW or to make provisions for a future station at this location. Please see the Chapter 2 of the Final EIS for details.

C-008-003

- For Segment C, we are not comfortable providing support for any of the proposed alternatives, and encourage Sound Transit to explore a C-4 alternative. It is important for the station to be in close proximity to the existing transit center, and therefore we are not supportive of C3 for that reason.

C-008-004

- Multi-modal access to the stations should be a high priority for Sound Transit and it will be essential to accommodate all modes, including bus, bicycle, on foot and car. We are pleased with the System Access Policy recently approved by the Sound Transit Board to increase transit ridership through improved connections with local transit, paratransit, bicycle and pedestrian infrastructure, kiss-and-rides, and private vehicle parking.

C-008-005

- It is also critical to integrate safety, convenience and comfort into the design of all facilities and improvements serving the station areas. Having been involved with Shoreline's Public and Stakeholder Involvement Plan, we repeatedly heard concerns from community members about traffic, safety and ease of access. In addition, there was a common interest in community space being programmed into the station area to make it more integral and accessible to the surrounding neighborhoods.

Thank you for this opportunity to comment on the Draft EIS. We look forward to continuing to work with Sound Transit and the communities as the project evolves. Please contact us if we can provide any additional information.

Regards,

Monica Smith
Urban Policy Director
206.550.9725 cell

C-008-003

Following the publication of the Draft EIS, Sound Transit developed a modification of Alternative C3 for the Final EIS in collaboration with the City of Lynnwood, with the goals of improving transit integration, better opportunities for future development, and minimizing natural resource impacts. Alternative C3 Modified (as named in the Final EIS) includes moving the station closer to the transit center and is the Preferred Alternative.

C-008-004

Comment acknowledged. The Sound Transit System Access Policy is referred to in the Transportation mitigation section (Section 3.6.5) for nonmotorized transportation.

C-008-005

Sound Transit designs and maintains all of its stations to be safe, secure and clean, and station platforms include weather protection. The stations are well lit, have security cameras, and are regularly monitored by security personnel. The current conceptual plans for the stations include open areas, and Sound Transit policy encourages partnerships with other parties that indicate an interest in coordinated developments in station areas.

September 16, 2013

Sound Transit
401 S. Jackson St.
Seattle, WA 98104

Dear Sound Transit Board,

C-009-001

I am writing to express my concern regarding how the proposed light rail line will affect the Latvian Lutheran Church. The Latvian Center (the Church and its large hall) is used heavily not only by Latvian-Americans but Lithuanians and Estonians as well. Negative impacts must be minimized at all costs.

We Lithuanians do not have our own church, school or office buildings. We rely heavily on our brother Balts, the Latvians, to share their Latvian Center with us. Although over the last 40 years we have been "renters" and not "owners" of the facility, we have come to cherish it as our own.

The Lithuanian-American Community of Seattle has enjoyed the use of the Latvian Center for community celebrations and other events such as fundraisers for the Baltic Studies Program at the University of Washington.

The Latvian Center has been the site of folk dance practices and performances, concerts by local and visiting Lithuanian musicians, wedding receptions and memorial services. The hall has hosted visiting dignitaries such as Vytautas Landsbergis, the first head of state of newly independent Lithuania, Senator Maria Cantwell, Congressman Jim McDermott, two Lithuanian Ambassadors to the United States, and trade delegations from Lithuania.

We have gathered at the Center for these and many other community-centered commemorations, often in conjunction with our Baltic brothers and sisters (for example, the annual joint church service and commemoration of the deportations of Estonians, Latvians, and Lithuanians to Siberia). We have held educational lectures, fundraisers, and political meetings. And for decades during the Soviet occupation of the Baltics, the Latvian Hall was the gathering place for community activists working together on critical items related to re-establishing the independence of our three countries.

The Center, with its many organizations and activities, serves as our extended family, especially to those of us who immigrated to America without grandparents, uncles, aunts and cousins. Once torn, the rich social fabric of the Latvian Center may be irreparably compromised.

The Seattle Lithuanian-American Community feels very strongly that preserving the Latvian church and community hall in its present location, and keeping it open during construction, is of paramount importance not only to the Latvian community but to the Lithuanian and Estonian communities as well.

Rimas Miksys
Rimas Miksys

Sound Transit DEIS
c/o Lauren Swift
401 S. Jackson Street
Seattle WA 98104

RE: Lynnwood Link Route Alignments

Dear Sir:

We are writing on behalf of the Pilchuck Audubon Society. Our organization has around 1200 members in Snohomish County and Camano Island. We advocate conservation and habitat preservation, especially as it relates to birds. We strongly support the benefits of light rail but do not want see negative impacts on the natural environment due to siting issues.

Wild birds and other wildlife along the proposed light rail routes depend on many natural attributes of the ecosystem that encompasses (a) Scriber Park, (b) the much larger, non-park wetland that is connected with it, and (c) undeveloped upland areas (natural and semi-natural non-wetlands) that adjoin the park and wetland. Each of these land types provides habitat for wildlife to use for such essential activities as foraging, concealment from predators, visual isolation from competitors, daily and seasonal movement routes, or courtship display and nesting. In addition, juxtapositions of the land types are important in meeting such needs for certain forms of wildlife.

C-010-001

All presently proposed alternate light rail routes (C 1, C 2, and C 3, as well as the City of Lynnwood's "C 4") cross wetland and adjacent natural or semi-natural upland. These options would physically intrude upon and eliminate wildlife habitat and obstruct wildlife use in various ways. Associated problems for wildlife and for the vegetation they depend on would include (but not be restricted to) noise, unnatural shade, and pollution by falling material. These matters would adversely affect wetland wildlife, upland wildlife that must occasionally seek water, and wildlife that otherwise depend on the interfaces between wetland and upland. The "edge effect" of interfaces between habitat types is well known as important for some birds and other wild animals.

C-010-002

Route C 1 crosses less wetland (and probably less upland natural area) than the other present alternatives but intrudes on Scriber Park (EIS drawing C1M-PP02)[1]. Therefore, it would detract from the park's function of bringing people into contact with nature and would degrade enjoyment of what many people seek in a natural park. We are also concerned about destruction and impairment of park land purchased with Conservation Future funds and intended to be protected in perpetuity.

[1] The drawings referred to exist in the Sound Transit 2 Plan's Draft EIS Appendix F, Part 3 (http://www.soundtransit.org/Documents/pdf/projects/North_het/Lynnwood%20DEIS/201307_DraftEIS_09_Appendix_F_part3.pdf).

C-010-001

Thank you for stating your groups' concerns about the alternatives crossing Scriber Creek wetlands. Most of the issues you raise are consistent with the Draft EIS discussions on pages 4-135 and 4-136, although falling materials and subsequent pollution are not predicted. During construction and operation, Sound Transit will abide by all applicable federal, state, and local environmental laws and regulations. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects.

C-010-002

Thank you for sharing your concerns regarding Scriber Creek Park. For what is now the Segment C Preferred Alternative, Sound Transit worked with the City of Lynnwood to develop a modified Alternative C3 that minimizes impacts to both Scriber Creek Park and the adjacent wetlands, while accomplishing other goals for the station site and its connection to the city center area. The Draft EIS identified potential impacts to the park with Alternatives C1 and C2 and identified potential mitigation for these impacts.

The Preferred Alternative does not require any property from the park. If Alternative C1 moved forward and required the use of Scriber Park property for the project, Sound Transit would seek approvals for conversion of property acquired using Conservation Futures funds, as well as mitigation for any impacts.

1429 Avenue D, PMB 198
Snohomish, WA 98290

PILCHUCK AUDUBON SOCIETY

425-252-0926
www.pilchuckaudubon.org

C-010-002 Route C 2 would cross much more wetland than the other alternatives (EIS drawing C2M-PP03), and because it runs along the south boundary of Scriber Park, its physical presence and noise would degrade normal park functions of natural aesthetics and tranquility, as well as adversely affecting wildlife and their habitat in the adjacent part of the park.

The parts of Scriber Park from which either route C 1 or route C 2 could be seen or heard would be made distinctly unpleasant for visitors. Presence of major artificial structures, as well as the train noise involved, would detract immensely from the park's natural character and from human enjoyment of the park.

C-010-003 Route C 3 (EIS drawing C3M-PP02) crosses slightly more wetland than C 1 does, and it lies far from the park, but it would affect much more undeveloped upland than the others do and consequently would have a substantial negative impact on wildlife and their habitat.

C-010-004 Each of the proposed routes (C 1, C2, and C 3, as well as the City of Lynnwood's "C 4") would reduce resources needed by our wildlife and human community. Adverse effects of the increasing separation of humans from the natural world are of great concern to us. Accessible urban parks and open space help to counteract this "nature deficiency."

Consequently, Pilchuck Audubon recommends that Sound Transit design a "C 5" route superimposed on Highway I-5 for a further distance than C 3 does. It could then either (a) curve more or less northward (bending to the degree that C 1 does in approaching Scriber Park) in order to reach the Lynnwood Transit Center or (b) continue to Alderwood Mall.

Sincerely,

Kathleen Snyder, President

Ray White, Ph.D.
Member and Consulting Biologist

C-010-003

While it is true that Alternative C3 would affect more undeveloped upland than Alternative C1 or Alternative C2, the EIS analysis does not find these effects as having a substantially greater negative impact on wildlife and wildlife habitat than the other alternatives. As shown in Figure 4.8-1c of the Draft EIS, the upland areas crossed by Alternative C3 are dominated by maintained vegetation. This classification is consistent with the aerial imagery in drawing C3M-PP02 in Appendix F. As defined in the Draft EIS Table 4.8-2, maintained vegetation generally consists of exotic grasses or annuals such as mown grasses and other low vegetation. Such areas are unlikely to support abundant or diverse populations of wildlife. The guideway in that area would be elevated. As noted on the Draft EIS page 4-137, shading and other impacts on vegetation underneath elevated guideways at most locations would likely be minimal, as guideways 15 feet high or more would be able to support herbaceous plants and shrubs similar to those currently present.

C-010-004

Each of the proposed Segment C alternatives would impact resources used by either wildlife or humans, but to different degrees. Sound Transit appreciates your suggestion for the development of a fourth alternative that would be placed on I-5. The proposed alignment is not being considered further because an alignment along I-5 beyond where Alternative C3 crosses to the Lynnwood Transit Center has a higher potential to impact the Snohomish County PUD Substation and the existing direct access ramps, and is less able to balance impacts and benefits such as effective multimodal connections, minimizing walking distances to the transit center, retain/enhance TOD opportunities, minimizing wetland impacts, reducing property, displacement and economic impacts, and connecting to the future City Center. An array of alignment options were considered as Sound Transit considered modifications to Alternative C3.

Subject: Lynnwood Link DEIS Comment - Ridgecrest Neighborhood Association
Attachments: Sound Transit Letter.docx

Sound Transit
DEIS Comments c/o Lauren Swift
401 S. Jackson Street
Seattle, WA 98104

September 13, 2013
Ms. Swift,
My name is Stefanie Gendreau. I am the Chair for the Ridgecrest Neighborhood Association (RNA) Board of Directors. The largest single-family residence neighborhood in Shoreline, we border the east side of Interstate 5, from 145th to 175th NE.
I am submitting this letter of initial comments on behalf of the RNA Board of Directors and our residents. Even though this project will result in an unfortunate loss of homes for some of our residents, without a doubt, we are excited about Light Rail coming to Shoreline. Specifically we look forward to the development potential in the Ridgecrest Neighborhood and the availability of effective regional transit for our community.

C-011-001

Members of our board have been debating the station options as detailed in the D.E.I.S. for many months. Not unlike our residents, our board members are not unanimous regarding the preference of station at either 145th Street or 155th Street. However, our group is definitely leaning towards 155th Street as our station location of choice.
In general, we see the 155th Street option as a station with a neighborhood focus and the 145th Street option as a commuter-oriented station, that would primarily serve those driving to/from the station. The 155th Street station would better serve a larger population of residents in South Shoreline compared to a station placed on 145th Street, at the periphery of our population base. Also, 155th Street serves as a more effective east/west thoroughfare with existing bike lanes, a direct path to neighborhoods and businesses east of Aurora, and easy access to parks and businesses located on both 155th and 5th NE.

C-011-002

Regardless of the final station location, we are unanimous in what is important to the residents of the Ridgecrest Neighborhood. In regards to the station itself, some of the important points are;

- A smaller scale parking structure sufficient in capacity to minimize overflow parking on neighborhood streets but small enough to encourage bike, bus, and foot travel.
- Consideration of implementing "pay to park" for vehicles, again to encourage alternate methods of reaching the station.

1

C-011-001

Your thoughts on the potential NE 145th Street and NE 155th Street stations are appreciated. The Sound Transit Board identified the NE 145th Street Station as the Preferred Alternative. The Board will make a final decision selecting the project to be built after publication of the Final EIS.

C-011-002

Your recommendations regarding the capacity of the parking garage and potential charges for parking are noted. The stations along the alignment would provide balanced access for a variety of modes, including transit, walking, biking and, in several locations, parking, consistent with Sound Transit's System Access Policy. "Pay to Park" options are being considered by Sound Transit throughout its system.

C-011-003 • A structure that has adequate and safe facilities for bicycles (access, storage, etc.).

C-011-004 • An effective solution, including enhanced signal controls, for traffic flow on 155th with a clear plan regarding emergency vehicles exiting the Shoreline Fire Station.

C-011-005 • A station design that does not overpower the single-family neighborhood.

C-011-006 • Inclusion of a green space that could be used for neighborhood events and to offset the loss of a portion of Ridgecrest Park.

• The addition of mature trees and plantings to replace trees that will need to be removed and to help alleviate sound impacts.

Other points deemed essential to our residents include;

C-011-007 • The development of a robust sidewalk and biking network on both main and residential streets.

• An increase in street lighting and effective crosswalk signals.

C-011-008 • Effective noise mitigation, including the detailed study of sound that travels up the ridge, (hence our RIDGEcrest name) into the heart of our neighborhood.

C-011-009 • More frequent service by KC Metro during peak travel times, with a focus on an increase of east/west routes.

C-011-010 • Purposeful rezoning to encourage the development of multi-family structures that include potential for new business and will support redevelopment of the 5th/165th business area.

As the project moves forward, the Ridgecrest Neighborhood Association will continue to be part of the visioning process and will work within our neighborhood to be a conduit for information between our residents and both Sound Transit and the City of Shoreline.

We are both excited and optimistic that we can work together to create a successful segment of the Link light rail system through Shoreline that best serves City of Shoreline residents (more specifically Ridgecrest Neighborhood residents) and enhances regional mobility for all. Thank you for this opportunity to comment on the DEIS and convey our interests and preferences.

Sincerely,

Stefanie S. Gendreau
Ridgecrest Neighborhood Association
Chair - Board of Directors
stefanie@RidgecrestNeighborhood.info

cc-City of Shoreline Interim City Manager Debbie Tarry, Planning & Community Development Director Rachael Markle, Senior Planner-Transportation Alicia McIntire, Associate Planner Miranda Redinger, Mayor Keith McGlashan, Deputy Mayor Chris Eggen, Councilmember Will Hall, Councilmember Doris McConnell, Councilmember Chris Roberts, Councilmember Jesse Salomon, Councilmember Shari Winstead, Sound Transit Community Outreach Coordinators Roger Iwata and Nytasha Sowers

2

C-011-003

As described in *Chapter 2 Alternatives Considered*, Section 2.3, all stations would provide for effective pedestrian and bicycle access to and from nearby bus stops, park-and-ride facilities, and surrounding streets. Bicycle parking facilities would be provided. They would be designed to satisfy all applicable design standards, public access requirements, and fire, life and safety standards.

C-011-004

Design for the NE 155th Street Station would include accommodation for emergency vehicle priority and access to and along the arterial. Potential traffic enhancements along NE 155th Street could include transit signal priority treatments at traffic signals.

C-011-005

If a NE 155th Street Station were to move forward as part of the project to be built, a range of architectural concepts would be explored during final design to minimize potential adverse effects of the new structures, noise walls, station area lighting, landscaping, and connections with local roadways.

C-011-006

In coordination with the City of Shoreline, Sound Transit has defined mitigation measures to offset the impact to a portion of Ridgecrest Park, including replacement of property for park areas converted to transportation use and installation of landscaping and a berm or barrier to provide visual screening. Trees do not typically offer notable sound reduction, but Sound Transit will work with WSDOT and Shoreline for tree replacement. Section 4.5 in the Final EIS discusses tree replacement.

C-011-007

All streets reconstructed with the project will meet local standards, which in Shoreline includes pedestrian and bicycle facilities as well as lighting and crosswalks. The Preferred Alternative plans have further details on these features, most of which are focused on the station areas and where streets are realigned for the project (near Ridgecrest Park and at the NE 145th Street and NE 185th Street Stations).

C-011-008

The noise and vibration impacts analysis considered topographical conditions in neighborhoods, including Ridgecrest, as described in Section 4.7 of the EIS and further detailed in the Noise and Vibration Technical Report. The Final EIS has updated information on potential noise impacts and mitigation, and Sound Transit's commitment is to mitigate all moderate to severe transit noise impacts in accordance to FTA standards.

C-011-009

The alternatives all assume an integrated transit service plan featuring local buses feeding the stations; for the EIS, Sound Transit worked with King County Metro and Community Transit to develop a conceptual plan, and east-west routes were prominent elements of the assumed network. King County Metro and Community Transit are ultimately the lead agencies for the actual service plans and any revisions, but their public planning for service revisions would be coordinated with Sound Transit, and typically occurs about a year prior to light rail project opening.

C-011-010

Thank you for your comment regarding rezoning to encourage higher-density mixed-use development. The rezoning of station areas, however, is not part of the Lynnwood Link Extension project. Rather,

revisions to land use plans and regulation is the responsibility of the local government. Section 4.2.4 Indirect and Secondary Impacts discusses these potential land use impacts in station areas. Rezoning in the Fifth Avenue NE and NE 165th Street business district would not likely occur, but could occur, as an indirect action related to the Lynnwood Link Extension project. Sound Transit is considering a light rail station at NE 155th Avenues, which is more than 0.5 mile from the district.

Re: Comments on the Sound Transit Lynwood Link Extension Draft Environmental Impact Statement Dated July 26, 2013, (the "DEIS")

To Whom It May Concern:

The Latvian Evangelical Lutheran Congregation of Seattle and the Latvian Association of the State of Washington jointly own and operate the church and community center building (the "Center") located at 11710 3rd Ave NE, Seattle, WA 98125 (the "Property"). This letter is written on behalf of our members and the multitude of people that regularly use our Center. We also write on behalf of the Estonian and Lithuanian communities in the Pacific Northwest who use the Center and share our deep concern with the alternatives Sound Transit has developed for the Lynnwood Link Light Rail extension.

The City of Seattle acquired our first church and community center through eminent domain in 1970. Our community members donated their time, money and resources to acquire the new Property, build the Center and renovate an existing residence for caretaker use. Since completion of the new Center in 1971, our members, and many others from the surrounding region, have regularly used the Center for a variety of religious, educational and culturally significant activities. The Center can be best described as the religious and cultural hub of the Baltic community in the Northwest. We have attached documents summarizing the Center's history as well as current uses for your reference. In addition we have attached letters expressing concerns with the DEIS submitted by individual groups that regularly use the Center. The following are our comments regarding the DEIS.

I. Overall Impact

C-012-001 After careful review, we have concluded that none of the alternatives, as currently presented in the DEIS is acceptable to our church and community. All of the alternatives considered in the DEIS, other than the no build alternative, threaten the continued viability of the Center. The alternatives proposed in the DEIS, whether at-grade or elevated, at best significantly impact the current uses of the church and center and at worst, render the Center unusable in its

C-012-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

C-012-001 entirety. The DEIS contains insufficient information to meaningfully evaluate how community events, our language school and church worship services would be impacted by the proposed

C-012-002 alternatives. That said, noise and vibration levels at similarly situated properties in relation to existing light rail routes, indicate that the impacts to the Property would be intolerable without significant noise, vibration and other mitigation. All of the alternatives appear to take a substantial number of parking spaces or impact those spaces such that they may be unusable. In

C-012-003 addition, the elevated alternatives would also create a negative visual impact and create a disturbance during any solemn event inside or outside the building.

C-012-004 Our main message regarding the DEIS is that all of the alternatives proposed will have significant negative impact to the Property and threaten the viability of our culturally rich ethnic community and activities that can continue only by virtue of the existence and functionality of the Center in its current location. Accordingly, our strong preference would be for the no build alternative. However, to the extent Sound Transit elects any alternative other than not building segment A, the following are our comments to the DEIS regarding the impacts caused and mitigation required.

II. At Grade Alternatives - Impacts and Mitigation Required

The at-grade alternatives (A1, A5, or A10), would require substantial changes from what is currently proposed in the DEIS if the Center is to remain in its current location. One change involves moving the route West far enough to avoid or minimize encroachment on the Property. This appears physically feasible and would substantially mitigate the impact of the alternatives to the Property.

In addition, the mitigation required would be acquisition of other property to restore lost parking, replace the caretaker's residence, and provide for a new ingress/egress. There are several adjacent residential properties that may be acceptable. In addition to mitigation for sound, vibration, and light among other things, these mitigation options for the impact of the at-grade alternatives would allow the Center to continue its existence at the current location, while at the same time allowing construction of the light rail line. Acquisition of a neighboring property would also partially mitigate the impact of the construction process, during which, it is also anticipated ingress and egress would be curtailed.

As currently proposed in the DEIS, the at-grade alternatives call for acquisition of our Property. As noted above, a second forced relocation of the Center in the 63 year history of the Baltic Community would be devastating and may lead to the demise of the Baltic community as a regional presence. The scope and cost of a re-location is incalculable on a cultural level, and difficult to assess on an economic level. If an at-grade alternative is selected without the above changes and mitigation, Sound Transit should immediately begin identifying three substantially comparable facilities within five miles of the Center that could be acquired and updated as necessary for our relocation and use.

C-012-002

The vibration and noise analysis for the church uses the FTA impact criteria. It is Sound Transit's policy to mitigate light rail transit noise that would otherwise result in moderate or severe impacts. See Section 4.7 of the Final EIS for updated impact and proposed mitigation information. Sound Transit's design for the Preferred Alternative also maintains the parking supply for the church and the center, although the configuration would be changed in some areas.

C-012-003

Your concern regarding visual impacts is noted and is consistent with information in the EIS. The impacts of the at-grade alternatives are rated as medium and include relocation of noise walls to the east and loss of vegetation as is illustrated in Figures G-16 and G-18. The impacts of the elevated alternatives are rated as high and include the visibility of the elevated guideways, which reduced intactness and unity of views and are illustrated in Figure G-17. Final design will continue to consider these impacts and potential mitigation.

C-012-004

Please see responses to C-012-001 and C-012-002.

III. Elevated Alternatives - Impacts and Mitigation Required

C-012-005

Based on the currently available information, the elevated alternatives will have similar impacts to our Property including increased noise, vibration and visual ill-effects. The DEIS fails to discuss the height or precise alignment of the track so we are left to speculate about these impacts. The DEIS also fails to provide sound testing results or information specific to our very unique property.

C-012-006

Regardless of the height of the elevated track, significant mitigation would be required. First, the track should be high enough to allow ingress and egress by large truck/trailers to the Property at its current location, otherwise new ingress and egress must be acquired. Second, the sound, vibration, visual and other ill-effects must be substantially mitigated to allow for continued use of the Property.

It is unknown to us at this time whether sufficient mitigation solutions exist to allow activities inside and outside the Center to occur without interruption under any of the above-grade alternatives. The elevated alternatives may allow for ingress and egress, depending upon track height, but do not reduce the mitigation requirements for the caretaker's residence and parking, which would require relocation or replacement. While the elevated route appears to avoid the necessity of the acquisition of the Property, we are concerned about the impact the noise, vibration and light effects would have on a candlelight service, a funeral service, a choir performance, or a class of seven year olds trying to learn Latvian language outdoors on a nice spring day.

IV. Concerns and Impacts Not Adequately Analyzed in DEIS

Regardless of which alternative is ultimately selected by Sound Transit, at-grade or elevated, there are a number of issues that affect the Property and our community which were not specifically addressed in the DEIS and therefore require further study. These issues include but are not limited to the following:

C-012-007

- The DEIS fails to include our property in several portions of the Technical Report for Noise and Vibration ("TRNV"). Section 3.1.1, Figure 3-1 and Section 3.2, of the TRNV note other churches and culturally significant properties along Segment A that were tested and studied for noise and vibration impacts and mitigation. Sound Transit needs to conduct the same study and testing with regard to our property.

- TRNV attachments C and D of the DEIS lack noise and vibration projections for our property with regard to alternatives A1, A5, or A10. Since mitigation of the impacts of those alternatives may include relocating ingress and egress through the acquisition of additional property, the DEIS should include the noise and vibration projections for alternatives A1, A5 and A10.

- Additional consideration needs to be given to designing the light rail alignment more to the West into the WSDOT right of way. The current alternatives presented in the DEIS appear to emphasize maintaining a separation between the freeway and rail line, as opposed to maximizing the separation between the rail line and our Center.

3

C-012-005

The elevated alternatives are rated as having a high visual impact on adjacent residential areas in the text and maps on pages 4-75 and 4-84 in Section 4.5.3 of the Draft EIS. In this case, the elevated guideway and overhead catenary would be readily visible and reduce intactness and unity of views from viewpoints to the east. The height of the elevated guideway relative to surroundings, including the Latvian Evangelical Lutheran Church, is shown in Figure G-17 in Appendix G of the Draft EIS. The conceptual plans provided in Appendix F of the Draft EIS provide greater detail on the alignment and the proposed light rail profile, including structural heights. Where applicable, information has been updated for the Final EIS.

Noise monitor location M-6 measured noise levels near the Latvian Evangelical Lutheran Church. The existing noise levels are described on page 4-110 and the extent of noise impacts are described on page 4-113 in Section 4.7.3 of the Draft EIS. The noise and vibration technical report provided further detail, but the monitoring location was used to predict noise levels and mitigation not only for the church, but also for surrounding residences, which are highly noise-sensitive.

C-012-006

Based on the design modifications developed for the Preferred Alternative (which were also applied to all of the at-grade alternatives) access to the property has been maintained through the realignment of the city street providing access to the church. See Section 3.2 of the Final EIS for a better understanding of the differences in impacts among the alternatives.

Depending on the alternative, noise mitigation includes a noise wall for at-grade alignment and the introduction of a 4-foot-tall to 8-foot-tall barrier at the edge of the elevated alignment. Vibration impacts would be mitigated by design measures that reduce the amount of vibration

C-012-008
- The DEIS fails to discuss temporary construction impacts on the day-to-day operation of our church and center. Major considerations would include, but are not limited to, equipment staging, earth moving and pile driving. These activities have the potential to not only impact normal activities, but would also inevitably dramatically impact special social events and performances due to dust, noise, limited access and restricted parking. This will, in effect, discourage attendance of events, thereby causing lost revenues at fund-raising activities as well as an overall decrease in utilization.

C-012-009
- The DEIS fails to recognize the significance of the caretaker's residence on the overall operations of Property. The presence of this structure at the entrance of the Property provides around-the-clock monitored access and security for the Center. In addition, the caretakers maintain the Center's building and surrounding grounds and provide real-time event scheduling. The Center could not function without such an arrangement in place and hence the role of this residence as an essential component must be discussed in the EIS and a replacement structure provided as mitigation, regardless of which option is selected.

C-012-010
- The DEIS needs to identify and mitigate the site specific impact of a rail line which as proposed runs very close to the Center and the current ingress and egress. To assure adequate mitigation is provided site specific engineering and geotechnical studies must be performed. The noise, vibration, light and electro-magnetic interference impacts of trains operating in such close proximity during church services might severely curtail or possibly even eliminate our ability to hold church services. These impacts may also eliminate our ability to facilitate the events that frequently occur at the Center including but not limited to: rehearsals, musical performances, dinners, presentations, speeches, as well as special social and holiday events that make up the core of our community.

C-012-011
- The DEIS fails to address the disruption caused at the Center's entry and within landscaped areas to religious gatherings, social events and Latvian school functions. A noise study that specifically addresses these potential impacts and defines necessary mitigation solutions must be performed, in view of trains coming through at 4-10 minute intervals.

C-012-012
C-012-013
- The DEIS fails to note that the WSDOT felt that the noise and aesthetic impacts to the Center from I-5 were significant enough in magnitude to justify the installation of a full abatement sound wall along our property. Certainly, with the installation of any rail line, we would expect Sound Transit to replicate this level of mitigation. Additionally, the DEIS needs to recognize the aesthetic impact of a potentially large wall adjacent to the Center and caretaker's house. The DEIS must identify mitigation incorporating architectural design features into the wall face to soften its effect on nearby viewers.

C-012-014
- The DEIS notes that our Center may be eligible for the city of Seattle Landmark status, but that it does not meet the 50 year requirement for NRHP. The DEIS fails to consider that at the time of construction of any of the alternatives, our Property will meet the 50 year requirement for NRHP and may then be NRHP eligible. The DEIS should evaluate mitigation as though the Property is NRHP eligible.

4

energy from passing trains to the ground. See Section 3.6 for proposed transportation-related mitigation, Section 4.5.6 for proposed visual impacts mitigation, and Section 4.7.7 for proposed vibration and noise mitigation. Both the Transportation and Noise and Vibration Technical Reports have also been updated in the Final EIS to reflect changed conditions.

C-012-007

Individual properties are indicated in the Noise and Vibration Technical Report, and although we did not mention the church specifically in the affected environment section, because elevated alternatives did not have vibration impacts, it has since been added to the Final EIS Noise and Vibration Technical Report for all alternatives. However, here is a synopsis for the Latvian Evangelical Lutheran Church in the Noise and Vibration Technical Report for the Final EIS:

- The church impacts are mentioned under the elevated alternatives in Chapter 7.
- Noise monitoring sites are shown in Attachment A, and site M-6 is right behind the church at a residence.
- Detailed noise impact tables are in Attachment B, the Latvian Evangelical Lutheran Church is typically near the top on the second page of each set of tables (one set for each alternative; the church is only under Segment A).
- Attachment C has maps showing the impacts, for example, the Latvian Evangelical Lutheran Church is shown as an impact on Figure C-2a, Alternative A3 impacts.
- Attachments D and E are for vibration and the church is included by address only in Attachment D, and there is an analysis for each alternative, just like the noise. Attachment E is vibration data, and not relevant to the church.

In response to concerns raised about impacts to your church property, Sound Transit has revisited the alignments of the alternatives in Segment A. As now described in the Final EIS, none of the Segment A

C-012-015

- The DEIS needs to address changes to the wheel screeching and other sound issues readily discernible in existing rail lines and identify appropriate mitigation beyond that outlined in the DEIS.

V. Conclusion

C-012-016

It is essential that we preserve the Center at its present location and off-set any adverse impact with acceptable mitigating measures. For instances where the mitigation is insufficient, we expect adequate compensation to off-set any reduction of usefulness, enjoyment or economic value of the Center. In the event of acquisition by Sound Transit, unlike a house, or a commercial building, the dollar value of this kind of loss would be difficult to calculate due to the Center's cultural and historical significance.

We respectfully request that you review these materials and address our concerns carefully and favorably when coming to a conclusion about which of the alternatives to select. We also look forward to working with Sound Transit, and cooperating to mitigate any impacts to our Property. Thank you in advance for your consideration of our comments.

Sincerely,

Latvian Evangelical Lutheran Congregation of Seattle

Andrejs Zamelis, President

Latvian Association of the State of Washington

Sarma Davidson, Chairman

5

alignments would displace the church building, but the western part of the property would be needed. However, Sound Transit's intent is to avoid displacing your church and community operations from the property due to light rail operation.

C-012-008

While the Draft EIS does not detail property by property the specific construction effects for each alternative, it did note that properties along the alignment would be subject to typical construction impacts. See section Section 4.5.3 (Visual), Section 4.7.3 (Noise and Vibration), and Section 3.2.4 (Traffic and Access). Section 4.4.6 also described the construction planning and coordination with affected property owners that would occur. See the Noise and Vibration Technical Report for property-specific information. Mitigation measures are also identified in the EIS for visual (Section 4.5.6) and noise and vibration (Section 4.7.7) impacts.

C-012-009

The realigned roadway needed to maintain access to the property would involve relocating the caretaker's residence, but Sound Transit would provide financial assistance and other services for the relocation, which would include a review of options for relocating near the church. Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for the alternatives.

C-012-010

Please see response to C-012-001 regarding revisions to the A alternatives and response to C-012-002 regarding visual impacts. The noise analysis for the church uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below that criteria. The

THE LATVIAN COMMUNITY CENTER
HISTORICAL & CULTURAL OVERVIEW

Over 1000 people of Latvian origin sought refuge in the Pacific Northwest after the end of World War II, rather than return to their homelands which had been illegally annexed by the Soviet Union. There were also immigrants of two other Baltic nations: Lithuania and Estonia. Latvian immigrants founded the Washington State Latvian Association in 1949 and the Latvian Lutheran Evangelical Congregation of Seattle in 1950. Their first Seattle home, purchased in 1955, was located at 4233 Densmore Avenue North in Seattle. The desire to congregate with fellow Balts led to developing the building for use as a church, school and social center. Thirteen years later in 1968, the City of Seattle announced its intent to acquire this property through the process of eminent domain in favor of developing the Wallingford Playfield and by 1970 the acquisition was completed.

The Latvian community raised funds and broke ground at 11710 3rd Avenue NE, Seattle on March 31, 1971. The new Latvian Center was designed and constructed by volunteers who donated over 8500 hours of their time after work and on weekends. The Center includes a church, minister's office, a large hall with stage and kitchen, classrooms and meeting rooms, a library, a playground, a caretaker's home and a parking lot. The dedication ceremony was held at this site on February 6, 1972. It was officiated by the Archbishop of the Latvian Evangelical Lutheran Church in Exile Arnold Lūsis, Dean Robert Āboliņš of the Seattle congregation and 11 other clergymen. The attendance of so many church leaders from across North America attests to the significance of this event well beyond Seattle.

The Latvian Community Center is the sole facility in Washington State serving the Latvian, Estonian and Lithuanian communities. It has been visited by Baltic presidents, ambassadors and governmental ministers, as well as U.S. Senators and Representatives. The current president of Latvia, Andris Bērziņš, is scheduled to visit on September 22, 2013. It is an official voting precinct for the Latvian government, serving citizens of Latvia who reside in our region. The Center is crucial for the continuation of Baltic cultural, educational and religious activities in the Northwest.

The Latvian Community Center, in addition to its broader cultural events, has also been the site of many family and personal celebrations. Both the church and center's hall have been used for weddings, christenings and confirmations, as well as anniversaries and birthdays. Many members of our community have had their memorial services and funerals at the very same location.

Multiple generations of Latvians work hard with each other to pass on their rich heritage at the Seattle Latvian Community Center. The Center's large dance hall and stage accommodates weekly Latvian folk dancing and choir rehearsals. We are proud to share this cultural wealth by performing folk dances at the Seattle Public Library, singing and dancing at Bellevue Sister City events and at Northwest Folklife, as well as opening the Center's doors to the general public for events such as the Christmas bazaar, spring rummage sale and concerts. Losing the Latvian Community Center would be a severe and eventually fatal blow to this vital community. An outline is attached describing the many groups that currently use the Latvian Community Center on a regular basis.

FTA criteria for noise are based on exterior noise levels and are more stringent than the criteria for traffic. It is Sound Transit's policy to mitigate moderate or severe impacts. Section 4.7.7 of the Final EIS describes the potential mitigation measures. As described in earlier responses, the Final EIS includes updated information on impacts and mitigation now that the at-grade alternatives do not displace the church. Section 4.13 of the Final EIS discusses electromagnetic fields, which are produced whenever electricity is used. No sensitive receptors (i.e. hospitals, radio stations) are within the range of the light rail line. It is not expected that the light rail would interfere with the Latvian Evangelical Lutheran Church's radio.

C-012-011

Please see noise discussion in response to C-12-010.

C-012-012

Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, if any existing WSDOT noise walls are removed and replaced as part of the project, they will be placed and designed to provide the same or better noise reduction as the existing wall, with no increases in highway noise levels.

C-012-013

Please see responses to C-12-003 and C-12-005.

C-012-014

The Latvian Evangelical Lutheran Church, built in 1971, does not meet the age criteria for the National Register of Historic Properties (NHRP), but it does meet Seattle's 25-year threshold for landmarks. See Section 4.16.1 and Section 4.16.2 of the Final EIS for additional information on the landmark process.

THE LATVIAN COMMUNITY CENTER
11710 3rd Avenue NE, Seattle, WA 98125

USE BY LATVIAN GROUPS

Latvian Evangelical Lutheran Congregation of Seattle

- Established in 1950
- Over 300 members in 2013
- 48 church services in 2012; three per month in Latvian, one in English
- Site of christenings, confirmations, weddings, funerals, ordinations and archbishop visits
- Congregational breakfasts and potlucks follow services on holidays
- Funds are raised to support congregations and rebuild churches in Latvia
- Daira Cilne, the congregation's fourth pastor, has served since 2002

Ladies' Committee of the Latvian Evangelical Lutheran Congregation of Seattle

- Prepares food for church socials
- Raises funds to support the church and other charitable causes

Latvian Association of the State of Washington

- Established in 1949
- 295 members in 2012; over 800 Latvians in Washington state
- Organizes cultural and educational activities at the Center
    - Observance of Latvian national holidays and anniversaries
    - Performances by touring Latvian musicians and theatrical groups
        - Performances and events typically attended by 80 – 200 people
    - Christmas Bazaar; food and culture shared with the Seattle community
    - Rummage Sale; raises funds for Center maintenance
        - Christmas Bazaar and Rummage Sale visited by hundreds from the Latvian, Seattle and greater Puget Sound communities
    - Art shows by local Latvian artists
- Supports education
    - Scholarships for youth to attend Latvian summer high schools
    - Donations to the Seattle Latvian School and summer high schools
    - University of Washington Baltic Studies Program fundraising events
- Publishes a bi-monthly newsletter of events and news in Latvian and English. Mailed to 335 current and former members of the Association. A few times a year it is mailed to an expanded list of 650 Latvian addresses in Washington State.

Seattle Latvian School

- Established in 1950
- The curriculum includes Latvian language, literature, history and culture
- Twenty students in the 2012-2013 academic year
- Classes take place Saturday mornings from fall through spring

C-012-015

Wheel squeal only occurs on tight radius curves, not on a straight section of track, like the ones along this segment of the corridor.

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. The FTA criteria for noise are based on exterior noise levels and are more stringent than the criteria for traffic. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

C-012-016

Please see the previous response to comment C-012-004.

As noted in Section 4.1, any acquisition of property would involve compensation to the property owner in accordance with the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970; the Washington State property acquisition policies and procedures in Chapter 8.26 Revised Code of Washington (RCW); and Sound Transit's adopted Real Property Acquisition and Relocation Policy, Procedures, and Guidelines.

- The school prepares students to attend Latvian summer high schools and university programs in the US and Latvia
- School graduate, Pēteris Elferts, was a member of Latvian Parliament and served as Latvian Ambassador to Ireland.

Latvian Folk Dance Group Trejdeksnītis

- Established in 1962 for teaching traditional Latvian folk dances
- 28 dancers in 2012, mostly high school and college students
- Rehearsals at the Center every Sunday, September through July
- Annual performances and events at the Latvian Center
  - Trejdeksnītis Spring Program; in 2013 it served as a fundraiser for the group's trip to Latvia to take part in the Latvian Song and Dance Festival
  - Christmas Bazaar
  - Host the New Year's Eve celebration for the Latvian community
  - Skandia Folkdance Society Annual Ball
- Annual performances for the Seattle area community
  - Seattle Public Library's Baltic Rites of Spring, in its 9th year in 2013
  - Yulefest at the Nordic Heritage Museum
  - Folklife Festival at the Seattle Center
- Performances at Latvian Song and Dance Festivals
  - In the past ten years alone: San Francisco, Toronto, Indianapolis, Ventura, Milwaukee, and Hamilton, Canada
  - In 1990, 1998 and 2013 – Riga, Latvia

Seattle Latvian Choir

- The Latvian choir "Sigulda" rehearses at the Center weekly
- Its 25 members perform in church on holidays, and in the hall at various events, including the commemoration of Latvia's Independence Day
- The choir has performed at many Latvian Song and Dance Festivals
- In 2012 "Sigulda" performed at Bellevue City Hall to honor the 20th anniversary of the sister city relationship between Bellevue and Liepaja

Latvian Cooking and Handcraft Groups

- The Latvian cooking group meets in the Center kitchen on Saturdays. Experienced chefs and bakers share Latvian recipes with younger generations.
- Two handcraft groups meet regularly at the Center to create traditional handcrafts and assist folk dancers in making Latvian folk costumes. One member, Skaidrīte Ābolina, was recognized by the City of Seattle and the Governor for her culturally significant work.
- Raises funds hosting lunches and events for Center maintenance and charities

Use of the Latvian Community Center
11710 3rd Ave NE Seattle

Seattle Latvian Library

- A volunteer-run lending library of books and recorded materials in Latvian
- Duplicates received from private collections are donated to libraries in Latvia
- Provides reading material for the Latvian Book Club

Latvian Fraternities and Sororities

- Meetings and events, including the annual University Ball
- Fundraising and charitable activities

Latvian Seniors

- Meet at the Center monthly for lunch and activities
  - Presentations and discussions about culture and current events
  - Show movies, TV specials and slides from Latvia or on Baltic issues
  - Entertain on another with skits, songs and poetry

Seattle Latvian Golf Association.

- Annual golf tournaments at Jackson Park Golf Course are followed by an awards dinner at the Center; in its 12th year in 2013
- In 2013 - 72 participants from Seattle, California, Arizona, Illinois and Michigan

USE BY THE LATVIAN GOVERNMENT

Voting precinct

- The Center is one of 15 voting precincts in the U.S. for Latvian national elections
- 125 people from Washington state and B.C. cast votes for the Latvian Parliament in 2011
- Many American Latvians have dual U.S. and Latvian citizenship, with voting rights in both countries

USE BY BALTIC AND ACADEMIC COMMUNITIES

Estonians and Lithuanians

- Estonians hold a church service at the Center once a month
- Lithuanians and Estonians celebrate national holidays and special events at the Center
- Memorial church service and program to remember Balts deported by the Soviets, organized and attended annually by Estonians, Latvians and Lithuanians

Baltic Studies Program at the University of Washington

- Annual fundraising auction and dance at the Center for the Baltic Program Fund

- Since 1994 Estonian, Latvian and Lithuanian languages, culture, literature and history have been taught at the University of Washington. This is the only such program in the U.S.
- The Baltic Program Fund, also since 1994, supplements the Program's budget and is building the Endowment for the Baltic Program to ensure a permanent program
- The University of Washington Tour Choir visited Estonia and participated in the Latvian Song and Dance Festival in July, 2013

LATVIAN COMMUNITY CENTER CARETAKER HOME

- For 25 years the Petersons family has lived in the home on the property and cared for the Center building and grounds
- Their round-the-clock presence provides added security
- Selga Petersons coordinates the Center calendar and caters many events there, including a monthly lunch for Latvian seniors

A TYPICAL WEEK AT THE LATVIAN COMMUNITY CENTER

Sound Transit
401 S. Jackson St.
Seattle, WA 98104

Dear Sound Transit Board,

C-012-017

I am writing to express my concern regarding how the proposed light rail line will affect the Latvian Lutheran Church. The Latvian Center (the Church and its large hall) is used heavily not only by Latvian-Americans but Lithuanians and Estonians as well. Negative impacts must be minimized at all costs.

We Lithuanians do not have our own church, school or office buildings. We rely heavily on our brother Balts, the Latvians, to share their Latvian Center with us. Although over the last 40 years we have been "renters" and not "owners" of the facility, we have come to cherish it as our own.

The Lithuanian-American Community of Seattle has enjoyed the use of the Latvian Center for community celebrations and other events such as fundraisers for the Baltic Studies Program at the University of Washington.

The Latvian Center has been the site of folk dance practices and performances, concerts by local and visiting Lithuanian musicians, wedding receptions and memorial services. The hall has hosted visiting dignitaries such as Vytautas Landsbergis, the first head of state of newly independent Lithuania, Senator Maria Cantwell, Congressman Jim McDermott, two Lithuanian Ambassadors to the United States, and trade delegations from Lithuania.

We have gathered at the Center for these and many other community-centered commemorations, often in conjunction with our Baltic brothers and sisters (for example, the annual joint church service and commemoration of the deportations of Estonians, Latvians, and Lithuanians to Siberia). We have held educational lectures, fundraisers, and political meetings. And for decades during the Soviet occupation of the Baltics, the Latvian Hall was the gathering place for community activists working together on critical items related to re-establishing the independence of our three countries.

The Center, with its many organizations and activities, serves as our extended family, especially to those of us who immigrated to America without grandparents, uncles, aunts and cousins. Once torn, the rich social fabric of the Latvian Center may be irreparably compromised.

The Seattle Lithuanian-American Community feels very strongly that preserving the Latvian church and community hall in its present location, and keeping it open during construction, is of paramount importance not only to the Latvian community but to the Lithuanian and Estonian communities as well.

Rimas Miksys

Draft EIS comments
c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

Dear Members of the Sound Transit Board,

C-012-018

I am writing to you in hopes of helping convey a strong message in support of preserving the Latvian Community Church and Meeting Hall located at 11710 – 3rd Ave. NE, Seattle, WA. It is my understanding that Sound Transit is considering possible routes through northeast Seattle which might impact the Latvian Hall.

C-012-019

As a member of the Seattle Estonian Community, the Latvian Hall represents as much of a "home" to our community as it does to Seattle-area Latvians as well as Lithuanians. As our community is smaller than the Latvian community, we have for decades rented the Latvian Hall as the centerpiece of our community meetings, holiday celebrations and cultural gatherings. The Latvian Hall has hosted visiting Estonian Presidents, members of Parliament and other dignitaries. It has also, on a personal note, naturally served as the site of my wedding in 2004, and hosted the funerals of my family members.

The Seattle Estonian community cherishes the Latvian Hall and our relationship with the Latvian and Lithuanian communities. The Latvian Hall is the foundation of that relationship and with its large auditorium, church and meeting rooms, it uniquely serves this purpose for our mutual use. The history we have shared over the decades within the walls of the Latvian Hall is immeasurable. During the Soviet occupation of the Baltic States, the Latvian Hall was a rallying place for legislative and political efforts in support of re-establishing independence in our homelands. Subsequent to the

September 16, 2013

Sound Transit
Draft EIS Comments, c/o Lauren Swift
401 S. Jackson St., Seattle, WA 98104

To the Sound Transit Board:

C-012-020 We are writing to express our concern for the future of the Latvian Community Center, located at 11710 - 3rd Avenue Northeast. As you know, the Center's activities will be affected by the light rail extension that is planned along Interstate 5.

The University of Washington's Department of Scandinavian Studies maintains close ties to Seattle's Latvian, Estonian, and Lithuanian communities, who all organize many events at the Latvian Center. Students and instructors in UW's international studies programs attend concerts, lectures, films, and theater performances, to learn about these countries and their people. Student tickets and parking are inexpensive (much cheaper than flying to the countries!), because the Center is owned by the Latvian community. The Scandinavian Department's Baltic Studies Program is the only program in the United States to teach Estonian, Latvian, and Lithuanian, three languages that are often spoken at Latvian Center events where UW's foreign language students can practice their language skills.

The UW Scandinavian Department also organizes events at the Latvian Center. The Center's central location, parking lot, and kitchen facilities make it an ideal place for community outreach activities such as our annual "Baltic Saint Martin's Day" celebration, lectures, and other events that UW co-hosts with community organizations.

C-012-021 For the next few years, construction of the light rail line will disrupt these educational events for our students and faculty, as well as UW community outreach opportunities at the Latvian Center. We hope that when construction is finished, the Latvian Center will be able to continue hosting the vibrant cultural life that enriches the education of our students and teachers and off-campus communities.

We hope that representatives of Sound Transit will be able to attend the UW Baltic Program's "Martin's Day" celebration on October 26, 2013, to see for themselves that the Latvian Center is an incredible gift to the Seattle community. We hope that Sound Transit will take every possible step to ensure that the Center can continue its activities during and after light rail construction.

Please contact the Department of Scandinavian Studies if further information is needed.

Sincerely,

Jan Sjåvik, Chair

Guntis Šmidchens, Associate Professor

Ann-Marie Petersons
Co-Director
Seattle Latvian School
11710 3rd Ave N
Seattle, WA

September 20, 2013

Sound Transit
C/o Lauren Swift
401 Jackson Street
Seattle, WA 98104

Dear Sound Transit:

C-012-022

On behalf of the Seattle Latvian school students, families and graduates we would like to express our concerns about the Northgate light rail expansion.

The Seattle Latvian School was established in 1950 for the purpose of teaching Latvian language, culture, and history. Since its inception, it has been a significant pillar in the small but active Latvian community in the Pacific Northwest. Hundreds of students have graduated from the school and as adults most students continue to be active participants within the larger community. The effect is that the school has a generational impact on our community. Almost all of the parents of our current students attended our school when they were young.

The Latvian Center and Church has several dedicated classrooms for the school. This enables our teachers to create an immersive cultural environment for our children. It would be very difficult to re-create this environment should we need to look for an alternative location to hold our school.

Our enrollment ranges in size from 25 to 50 students and this fall we will welcome 25-30 pupils. Currently, all of our students are under 9 years of age, although typically we have students from 3 to 14 years old. We are disheartened to think that these children might not have an environment to further their Latvian education as they grow older.

C-012-022

Please see the response to C-041-001.

C-012-023

Sound Transit
September 20, 2013
Page 2

We urge the transit commission to work closely with the Latvian and Northgate communities to find a solution that allows continued access to the building and mitigates all impacts so that our School can continue operating successfully. Impacts to the school from the light rail include, but are not limited to, noise coming from the tracks during outdoor time, vibration, and lack of parking in the event any of the alternatives result in reduction in parking. In addition, Sound Transit should plan to relocate the school temporarily during construction since a closure of the school for any period would be disruptive to the children and the education we provide.

While school is primarily on Saturday mornings, we also have several events that are held on weekend evenings with adults and community members are present. If parking is severely limited, this will impact our ability to hold those events.

Thank you in advance for reviewing our school's comments and taking them into consideration when considering this expansion of mass transit.

Sincerely,

Ann-Marie Petersons

C-012-023

Please see the response to C-041-002.

SIGULDA

Sound Transit DEIS Comments
c/o Lauren Swift
401 S. Jackson St
Seattle WA 98104

September 18, 2013

Re: Lynnwood Link Light Rail Extension

I am writing on behalf of the Latvian choral ensemble Sigulda, based in Seattle. Our 25 member group was established in 1985 and has performed at multiple events in the Seattle area over the years. Sigulda sings for Latvian functions and church services, as well as for other community performances, including Northwest Folklife and the Bellevue Sister Cities Association.

C-012-024

It is a great concern to us that the Seattle Latvian Community Center is endangered by all of the alternatives currently proposed in the DEIS. We hold weekly rehearsals in the hall at the Center, located at 11710 3rd Avenue NE. We have always had a need for piano accompaniment and hence have never been able to fit rehearsals of that size in any one individual's home.

We urge Sound Transit to find an acceptable version of developing the light rail project through the Northgate area that allows the Seattle Latvian Community Center & Church to remain a vital, functioning property. There simply is no other location within the Baltic community that serves such a prominent role throughout the Pacific Northwest.

Please consider the needs of the local citizens who use this Center so frequently and on so many different levels, as you move forward with this project. Thank you for your consideration.

Sincerely,

Inese Bergman, Sigulda member
611 Birch St
Edmonds WA 98020

Sound Transit
Draft EIS Comments
c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104
LynnwoodLinkDEIS@soundtransit.org

Dear Sir or Madam:

C-012-025

I am writing today regarding access to the Latvian Cultural Center (next to I-5 near 117th and 3rd) during and after construction of the planned light rail extension to Lynnwood. As the current Artistic Director of Seattle's Latvian folk dance ensemble, Trejdeksnitis, I would like to impress upon you the need for access to our rehearsal and performance space.

Trejdeksnitis has 3 hour rehearsals every Sunday evening during the dance season, roughly September through the following July. We are not only learning the traditional dances that have been taught to Latvians for many years, we are learning new dances from Latvia as well. We also have a number of choreographers in our group that create dances each and every year for us to learn. A number of these have received top awards at the North American Latvian Song and Dance Festivals. These festivals are just a few of the performances we participate in.

Currently, we regularly perform around the greater Seattle area at a number of functions including: Yulefest at the Nordic Heritage Museum, annual Christmas Bazaar at the Seattle Latvian Cultural Center, Baltic Rites of Spring (initiated almost 10 years ago by the Seattle Public Library) at the Downtown branch of the Seattle Public Library, annual Spring Program at the Seattle Latvian Center, Folklife at the Seattle Center, and the Midsummer Festival called Jani at the West Coast Latvian Educational Center near Shelton. Last year we were also asked to perform at the annual meeting for the American Latvian Association, and the annual Ball for the Skandia Folkdance Society, which was held at the Seattle Latvian Center for the first time. The Skandia Folkdance Society was so impressed with the venue that they immediately booked it for the following year. This year we have already been asked to perform at the holiday bazaar at the Portland, OR Latvian Center, and at the annual St. Martin's Eve fundraiser for the Baltic Studies Program at the University of Washington held at the Seattle Latvian Center.

Last Sumner we danced in Riga, Latvia as performers in the Latvian National Song and Dance Festival. This event occurs every 5 years and this year involved almost 15,000 dancers. It was

TREJDEKSNĪTIS - 11710 3rd Ave N.E. - SEATTLE, WA 98125 – www.trejdeksnitis.org

C-012-025

In response to concerns raised about impacts to the church property, Sound Transit has revisited the design details of the Segment A alternatives. As now described in the Final EIS, none of the Segment A alternatives would displace the church building, but the western part of the property would be needed. However, Sound Transit's intent is to avoid displacing your church and community operations from the property due to light rail operation.

an amazing experience for us, and for some a once in a lifetime event. Trejdeksnitis participated in the same event back in 1990, 1993, 1998, and we hope to be there in 2018.

C-012-026

However, to make it there we must have access to our rehearsal space. Currently we don't pay any rent at the SeattlenLatvian Center since we are under the umbrella of the Latvian Association of the State of Washington. If we had to go elsewhere for practice we would have to pay an average of $300 per week, and dancers would have to start paying dues to cover the cost. Currently we pay none. If this occurs, we would loose many if not all of our dancers. The majority of the dancers are in school, (High School - Graduate level) and would not be able to afford it.

It is imperative that all construction related impacts to the Seattle Latvian Center be mitigated in a manner which allows our continued use of this facility during construction and that the long term impact resulting from the operation of the light rail system be mitigated in a manner allowing our continued use of this facility.

If we lose access to the Seattle Latvian Center, even for a few months, this will not only cost us money for rehearsal space rental that we cannot afford, but might cost us dancers as well. We are a volunteer organization and the harder you make it for people to attend, the harder it is to get them to keep coming back. Currently we have 4 performances scheduled between now and Thanksgiving. This could well be the case every year from now on. Thus we desperately need access to the Seattle Latvian Center to be uninterrupted each and every year.

If you are interested in seeing what sort of dancing we do, I invite you to look us up on youtube, and to take a look at our facebook page

https://www.facebook.com/pages/Trejdeksnitis/160625053988041?ref=hl

Thank you for your time, and I look forward to hearing from you.

Kathrine Young
Artistic Director, Trejdeksnitis

TREJDEKSNĪTIS - 11710 3rd Ave N.E. - SEATTLE, WA 98125 – www.trejdeksnitis.org

C-012-026

Thank you for your concerns about the potential displacement of the Latvian Evangelical Lutheran Church and for highlighting its significance to the region's Baltic community. This was the most frequent topic noted in the Draft EIS's public comment, and the Sound Transit Board subsequently directed Sound Transit to explore a Preferred Alternative that would avoid displacing the church. Since the publication of the Lynnwood Link Extension Draft EIS in June 2013, additional engineering was undertaken to reduce adverse effects on the Latvian Evangelical Lutheran Church property and facilities located at 11710 Third Avenue NE, Seattle. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained.

Several sections in the environmental document have been updated to address these changes including: Section 2.5.1 describes the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative. Compensation would be provided if the alternative selected for construction would require acquisition of land or improvements as is required by the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970; the Washington State property acquisition policies and procedures in Chapter 8.26 Revised Code of Washington (RCW); and Sound Transit's adopted Real Property Acquisition and Relocation Policy, Procedures, and Guidelines.

Construction of the light rail guideway in proximity to the Latvian Evangelical Lutheran Church would take approximately 1 to 2 years, a

Pat McCarthy
Pierce County Executive
Sound Transit Board Administration
401 S. Jackson Street
Seattle, WA 98104

Dear Ms. McCarthy:

C-012-027 We are writing to you on behalf of the American Latvian Association Board of Directors and the 90,000 member strong US Latvian Community to express our deep concern regarding the news from Seattle Latvian Organizations that their historic Community Center is in jeopardy due to the Sound Transit plans of extending the Lynwood Link railway line.

C-012-028 The Seattle Latvian group is our largest member organization with several hundred active Latvian families, who utilize the property at 11710 3rd Avenue NE as the "epicenter" for ethnic activities. Regular Church services, Sunday school for children, ethnic celebrations and gatherings, Latvian choir and dance group rehearsals, as well as weddings and funerals take place there. It is one of the three largest and best organized Latvian centers on the West coast, in addition to Los Angeles and San Francisco.

ON A LARGER SCALE, it is not only the Latvian community that would be affected by the proposed transit line; the center is regularly used by Estonians, Lithuanians and even the students at the University of Washington Baltic Study program – the only such program in the United States.

HISTORICALLY, The center is of important cultural heritage and importance to Seattle area Latvians and Balts. When the Latvian refugees were admitted to the United States after the WWII, several hundred settled in the Seattle area. They organized, purchased land and built the first Latvian Center on Densmore Avenue North in 1955. Unfortunately, in 1969, the City of Seattle took the property for development of the Wallingford Playfield. Next year, the history may repeat itself – the second center, built by Latvian volunteers in the 1970s on the 3rd Avenue, is in danger of being expropriated.

The center is crucial for the continuation of Latvian and Baltic cultural, educational and religious activities, it has been visited by all the Baltic presidents, ambassadors and several government ministers, as well as US Senators and ambassadors. It is the home of:

- Seattle Latvian Evangelical Lutheran Church, established in 1950
- Washington State Latvian Association, established in 1949
- Seattle Latvian School, established in 1950
- Latvian Folk dance group "Trejdeksnītis", established in 1962
- Seattle Latvian Choir
- Seattle Latvian Library
- Latvian student fraternities and sororities
- Latvian Seniors' club.

(Over, please)

longer period for elevated alternatives. Construction work would predominantly occur between 8 am and 6 pm during weekdays with occasional nighttime and weekend construction. Near-term construction activities would be communicated to adjacent property owners through a proactive community outreach plan and may include newsletters, Internet postings, community meetings, and direct contact by a Sound Transit representative. Reconstruction of the noise wall on the west edge of the church property would require negotiation of a temporary construction easement that would be negotiated prior to the start of construction.

Sound Transit intends to maintain access to the church and community center buildings during construction, though the access may differ somewhat from existing conditions for short periods. Other short-term impacts would include visual, air quality, and noise impacts. They would be avoided and minimized with the implementation of best management practices. These would include fencing the construction area for public safety, spraying the construction area with water to reduce dust, and use of temporary noise walls where practical. For additional information, see Sections 4.5.7, 4.6.7, and 4.7.7, respectively.

C-012-027

Please see response to C-002-001.

C-012-028

Please see response to C-002-002.

IN ADDITION, it is the place for one of the 15 polling centers in the United States organized by the Latvian government and the American Latvian Association for Seattle area Latvian citizens to cast their ballots in Latvia's National Elections.

C-012-029

Please keep Seattle diverse! Do not allow the proposed transit line destroy the Latvian Center! If we lose this site, we lose more than a building, and we fear that the local Latvian community will not have the means, manpower and moral strength to rebuild their center for the third time!

Sincerely,

Anita Batarags
President and Board Chair

Raits Eglitis
Secretary General

Sound Transit Comments c/o Lauren Swift
401 Jackson St.
Seattle, WA 98104

To the Board of Sound Transit:

C-012-030

The Seattle Latvian Lutheran congregation is experiencing a feeling of *deja vu.* Yet again it has become a possibility that our church and community center will be taken from us, as it was 44 years ago. For the older members—this is the place they built with their hands, volunteering their time, after work and on weekends. Built not only with brick and mortar, but also with hopes and dreams—a center for their children and grandchildren, so that they too could learn about their Latvian heritage.

In the 42 years since we are in our present location, this has become our Latvian church home. It's where we gather on Sundays to worship in the language of our heart—the only place in Seattle, where services are held in Latvian. And, since our community has now grown to include many "adopted Latvians" who many not speak the language, but do feel at home—we also have services once a month in English.

It's the spiritual home to which our children and grandchildren return for Christmas and Easter. It's where we celebrate the birth and baptism of our little ones. (Next Sunday, we will be baptizing Kevin Erik, whose mother was also baptized in our church—a continuity that adds richness of meaning for both parents and grandparents!)

It's where we rejoice with young couples (and occasionally, not so young!) as they set out on the journey of marriage—and where we mourn those whose life journey has come to an end. In church, our family home.

I speak for all of us—the founding members who built our church, their children who are now bringing their own children here, as well as our dear "adopted" Latvians: it is our hope and our prayer that this time it won't be *deja vu,* that Sound Transit will find a way to let us remain in our church home that is so important to our lives.

Sincerely,

Pastor Daira Cilnis

Seattle, WA 98175-0081

Sound Transit
c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

C-012-031 We, the 300+ members of the Latvian Association of the State of Washington, are deeply concerned and bitterly disappointed about your proposed Light Rail plan. If the plan proceeds, it will drastically disrupt the well-being and perhaps even destroy the existence of the Latvian Lutheran Church and Cultural Center. Your planned construction of the Light Rail link between Northgate and Lynnwood does not seriously consider the social, cultural and physical impact on our old and well established multifunctional Center.

C-012-032 As you know, our first church and cultural center was taken for a park by the city of Seattle in 1969. Now it appears that we are facing possible condemnation and eviction for the second time in our 62-year history. In addition to our bitterness about the proposed plan, we most emphatically feel that virtually no consideration was given in your earlier planning to our facilities and the organizations which depend upon the Center. Although your current options do take minor note of our existence, those options are nonetheless inadequately thought through and need considerable further study. Issues of concern include, among others, track alignment, access, construction impact, noise abatement, geotechnical matters and the destruction of our caretaker's house.

C-012-033 In our opinion, Sound Transit has not fully examined nor addressed and given clear responses to our concerns. There also has been no meaningful rail alignment option given, such as relocation of the rail bed. There have been no solutions offered for the noise problems, vibration, lights and radio interference nor is there evidence of geotechnical studies having been performed.

For these reasons we request that you seriously review your plans and reconsider the DEIS and provide us with other workable alternatives.

SOUND TRANSIT
c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

To Whom It May Concern,

I am writing to you on behalf of the American Latvian Youth Association ("ALJA"). Our mission, since our founding in 1952, has been the furtherance of Latvian culture, language, and knowledge among Latvian youth across all of the United States. Over the past 61 years, we have had thousands of members throughout the country, and we are currently as active as ever in our history. While most of our membership resides in the Midwest, a core component of our ability to succeed in our mission is broad support from all of the Latvian community centers in the country. Since 1971, we have frequently used the Seattle Latvian Center for meetings and events. In addition, on several occasions, we have held our biggest annual event, Congress, in Seattle. From our perspective, The Latvian-American "experience" in Seattle is not rooted in Pike Place Market or the Space Needle. It is the Seattle Latvian Center, nestled amongst towering evergreens on the north Side of town, that for generations has served and nurtured our tight-knit community. While it may seem like another just another social hall or private structure standing in the way of a public works project, to us the Seattle Latvian Center truly *IS* Seattle. Countless weddings, confirmations, Youth Congresses, and other special events within the Latvian community have happened there. The Seattle Latvian Center is the largest and most vibrant in the Pacific Northwest, and I personally consider it the most uniquely beautiful Latvian community center in the United States. It is not just a simple social hall, but also a church and Latvian language school for our children. It was built from the ground-up by our fathers and grandfathers and to us, its importance goes beyond the bricks and mortar of the building itself.

This is especially true to our aging community members throughout America. To them their local Latvian community center is home. The Seattle Latvian Center is no different. Having lived through the horrors of World War II and the Soviet Occupation, our elderly population would definitely be the most affected by the loss or relocation of the Latvian Center. It will be recalled that the Soviet Union used eminent domain to make public their homes and possessions. To allow that to happen again, albeit with completely different motives, would no doubt be seen a slap in the face to the elderly Latvian population in Seattle. Our cultural centers embody the decades of work, decades of struggle, and decades of pride within our ethnic community. In Seattle, the Latvian community is vibrant and alive largely as a result of having such a fine facility. For many in Seattle, the Latvian center represents their unique struggle and shows that with grit and perseverance they were able to build a community thousands of miles away from home. The term "negative impact" does not even begin to describe the toll that this project would take on the local Latvian community. The impact on our organization would be the loss of a facility that is integral to the furtherance of our mission.

C-012-034 Accordingly, we request that Sound Transit review each of the alternative routes in the DEIS, and select the one that has the least impact on the activities of the Seattle Latvian Center. To the extent there is an option that allows the Latvian Center to remain in its current location, we respectfully request that such alternative be reviewed and selected, and that any impacts be fully mitigated. The relocation of such a culturally significant facility would have substantial impact on ALJA and would be devastating to the local community in Seattle.

C-012-034

Please see response to C-026-001.

C-012-034 While we understand the need and demand for public transit expansion in the city, our organization, ALJA, on behalf of our members nationwide, urge Sound Transit and the City of Seattle to re-route the proposed railroad to save our largest cultural, educational, and social hub in the Pacific Northwest.

Respectfully yours,

Karlis Lenss

Pat McCarthy
Sound Transit Board Administration
401 So. Jackson Street
Seattle, Wa. 98104

Dear Ms Pat McCarthy,

C-012-035

We, the members of the Latvian Sorority GUNDEGA, have reviewed the Draft Environmental Impact Statement, attended the community meetings and we are now expressing our deep concern regarding the possible destruction of the Latvian Center and the Church, the cultural pillars of the long standing Latvian and Baltic community. Our sorority members have attended important and historical events at the Church and the Center to meet the presidents of the Baltic countries, to support the UW Baltic study program, to participate in religious services and educational gatherings, as well as to share in ethnic and personal life celebrations. The Church and the Center are the glue holding our organization and our community together, allowing it to grow while preserving Latvian ethnicity and culture. The Latvian sorority tradition dates back to1920s and remains an important part of the Latvian women's lives across generations. Interrupting or eliminating the access to the Church and the Center would severely disrupt our ability to continue our traditions and share our rich cultural heritage with the city of Seattle.

C-012-036

It is of utmost importance that the Lynwood Link Extension construction allows the continued access to the Center, that the caretaker's house is reconstructed and that there is a minimal long-term disruption to the Center's function due to noise disturbance.

C-012-037

Do not allow the proposed transit line to destroy the Latvian Center, Church and the Latvian community.
We have enclosed our signatures.

Sincerely,

Zaiga Alksne Phillips

Seattle, Washington 98104

Dear Folks at Sound Transit!

C-012-038

We have just received some most disturbing news: that you are planning to take away the driveway of the Latvian Lutheran Church at Northgate. That would remove any access to that beautiful and essential building, rendering it totally useless! Please, please try to do what you have to do in some other way! Our Estonian Congregation and other cultural organizations have been using that facility for many years!

Thanking you for your consideration,

Sincerely yours,

The Rev. Hendrik Laur, Pastor

August 16th, 2013

Ms. Pat MacCarthy, Chair of the Board, Sound Transit

Dear Ms. McCarthy,

C-012-039

We have learned, with concern, about the probable adverse effects of a proposed train line on our Seattle Latvian Lutheran Church.

This congregation is a key element for us not only in the US Pacific Northwest, but for our Church in general.

The Seattle congregation also is historically significant to our Church. The late archbishop Dr. Kārlis Kundziņš was part of the congregation while the head of the entire Latvian Evangelical Lutheran Church Outside Latvia. Also, my predecessor archbishop Arnolds Lūsis was consecrated here.

Our Seattle congregation not only provides spiritual care for over 300 members and shelters a school, but its social hall is used for a wide range of religious, cultural and education events.

The Seattle Estonian Lutheran Congregation also has its regular services in the church.

Forcing the congregation from its property, or even compromising its ability to function effectively because of loss of space, or because of noise and vibration, would deal a blow to the community from which it may not recover. Please consider the effects of this on the membership – particularly children, youth and the elderly.

Please choose construction alternatives which would allow this church and community to continue its important work.

Sincerely yours

+ Elmārs Ernsts Rozītis
Archbishop

Re: Impact on Seattle Latvian Cultural Center

C-012-040

The Bellevue Sister Cities Association, Liepaja, Latvia Committee would like to add its concern to those questioning the present alternatives for the Lynnwood Link Extension DEIS and the serious impact it will have on further use of the Seattle Latvian Cultural Center.

The Seattle Latvian Cultural Center is a focal place, not only for those of Latvian background living in Seattle, but for all of us in the Pacific NW. The Latvian Association was a strong supporter back in 1992 when Liepaja, Latvia became one of Bellevue's sister cities, support that has continued throughout the past twenty years. The Latvian Cultural Center has been the venue for many of our social and informational as well as our fundraising events during this time. We are concerned that the present plans would greatly affect the use of this facility, a huge loss to us, as well as to the many other organizations that use it on a regular basis.

We hope that you will take this into consideration and provide for access to the Seattle Latvian Cultural Center so it can continue as a gathering place for the many people and organizations that presently use it.

Sincerely,

Inta B. Gotelli, BSCA treasurer

Sound Transit
Comments c/o Lauren Swift
401 Jackson St.
Seattle. WA 98104

To whom it may concern:

C-012-041

It has come to our attention that with the extension of the Sound Transit system in the Seattle area the Latvian church and community house may perish. The World Federation of Free Latvians (WFFL), which is the umbrella organization for Latvian communities outside of Latvia, and among whose duties it is to preserve the Latvian heritage - language and culture - as long as possible, hopes that an alternate solution can be found and this particular property will stay unaffected.

The Latvian community in the USA is not a large one and with every passing year, it is more and more challenging for the various Latvian groups to maintain their churches and community centers. The Latvian church and community center in Seattle is particularly important as it is the only one is the state of Washington.

Please give this matter your closest attention and consideration.

Respectfully yours,

Jānis Kukainis
President, WFFL

C-012-042

Having reviewed the Lynnwood Link Extension DEIS, I am very concerned that all of the proposed alternatives will severely impact the Latvian Church and Community Center and the activities of hundreds of families who consider it their „ethnic home".

As a Latvian language camp for 3 to 14 year olds, Mežotne draws its camp participants, counselors, and staff from the various Latvian communities along the West Coast, predominantly from the Seattle metropolitan area. The Latvian language and knowledge of our heritage is a critical staff requirement in order for the camp to function. Thus the continued existence of the Latvian Church and Community Center is of major importance to our existence as well. This is the place where our families have a common bond, a common history, and a language school for their children.

We are now in the third generation of community members born in the U.S. who are still highly immersed in the language and the culture of Latvia, while being just as involved in their American communities. It takes a great deal of effort, time, and money to live in two parallel cultures, and the Latvian community is doing it! We do not want that jeopardized!

Access to and continued use of the Latvian Church and Community Center during construction and long term operation of the Lynnwood Link Extension without undue noise and access problems needs to be guaranteed so that our community does not lose its continuity, so that we are not displaced by obstacles not under our control.

Respectfully yours,

Inese Graudiņš

C-012-043

We, members of "United in Art", are extremely concerned about losing our access to the "**Latvian Cultural Center**". It has been our home for many years and a refuge where Latvian artists from the West coast of the U.S. and Canada have organized Art Exebitions and Artist's Conventions. The intrusion of Light Rail will affect a great number of people other than just artists. The location of the "**Latvian Cultural Center**" is ideal because it is close to I-5 and easily accessible by car, therefore, a large parking area is vital.

We understand that Light Rail will bring a lot of good in the way of transportation to a lot of people, but hopefully, **not at the expense of destroying a whole community.** We are begging you to consider all possibilities in solving the parking problem for the "**Latvian Cultural Center**", in order that all the people who have used the center and enjoyed half a century of educational and recreational activities, may continue to do so.

Yours truly,

United in Art, Secretary

C-012-043

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. See Section 2.5.1 for a description of the refined Segment A alternatives that avoid displacing the church.

The modifications for the project include a realignment of the city street serving the church, which will provide a street meeting current city standards, including sidewalks. The parking area would be modified but Sound Transit anticipates the current levels of parking for the church would be maintained.

C-012-044

Along with other members of the Washington State Latvian community, I am very concerned about the future of our church and community center because of the impact that the Light Rail extension north to Lynnwood will have on our facility.

We have at the center a library with several thousand volumes of Latvian books and journals. The library serves the entire community: older people who feel the need to read in their native language; younger people who want to learn about Latvian authors and Latvia's history; and children in Latvian school, who are studying the Latvian language and learning about the culture of their parents and grandparents.

The library is a source of reading material for our Latvian Book Club, which meets regularly throughout the year. By donating not insubstantial sums to the Baltic Studies fund each time we meet, the Book Club supports the Baltic Studies program in the Scandinavian Department at the University of Washington. UW officials have consistently expressed their gratitude for the great support from the Latvian community.

Each year our Latvian library ships hundreds of books by Latvian authors living in the west to libraries and schools in Latvia. These books were not available, and indeed forbidden, to readers in Latvia during the 50 years of communist occupation.

If we lose the Latvian Center, the library will cease to exist and our community will be deprived of the strong link to its cultural heritage that books provide. We ask you to do everything possible to let us keep the church and center.

Sincerely,

Dr. Vaira Pelekis-Christopher

LETTONIA
STATE OF WASHINGTON ALUMNI ASSOCIATION

September 14, 2013
Mukilteo

Sound Transit
Draft EIS Comments
c/o Lauren Swift

I am writing to you on behalf of the 22 current members of Latvian fraternity Lettonia State of Washington Alumni Association. Lettonia uses the Seattle Latvian Community Center several times a year for our chapter meetings and important celebrations, like our annual anniversary of the founding of the fraternity in 1870. More importantly many of Lettonia's members were among the Latvians who volunteered both time and money to build the existing facility at 11710 3rd Avenue NE. Because of the work and money the many Latvian fraternities devoted to the Center, we were granted free use of the Center's facilities. Losing this means we will have to use our membership dues to pay for facilities, rather than donating the money to educational causes, like the Latvian school.

All of us have been or still are active in other groups (church, seniors group, choir, folk dancing, golf association) associated with the center, including in leadership roles in these groups, so we will feel the disruption due to the impacts there too.

C-012-045

We request that the Sound Transit board take into account the needs of the Baltic community that utilizes this facility, find mitigations that will allow the Center to remain in its current location and continue to serve this very unique population.

STUDENTU KORPORACIJA
Fraternitas Metropolitana
1896/1924

To Sound Transit Sept. 3, 2013

Comments c/o Lauren Swift

401 Jackson Street

Seattle, WA 98104

C-012-046 Our organization has reviewed the Lynnwood Link Extension DEIS and concluded that all the alternatives presented severely impact the Latvian Church and Community Center. Our organization, Fraternitas Metropolitana, relies heavily on this facility for fund raising, meetings and annual holiday celebrations. Any disruptions to its availability, whether temporary or permanent , will either severely disrupt our daily activities or lead to its ceasing to exist because the availability of the facilities guarantee our very own existence.

It is imperative that ball construction related impacts to the Center be mitigated in a manner which allows our continued use of this facility during construction and that long term impact resulting from the operation the light rail system be mitigated in a manner allowing our continued use of the facility.

Paul A. Krastins, President

Fraternitas Metropolitana

West Coast Alumni Association Chapter

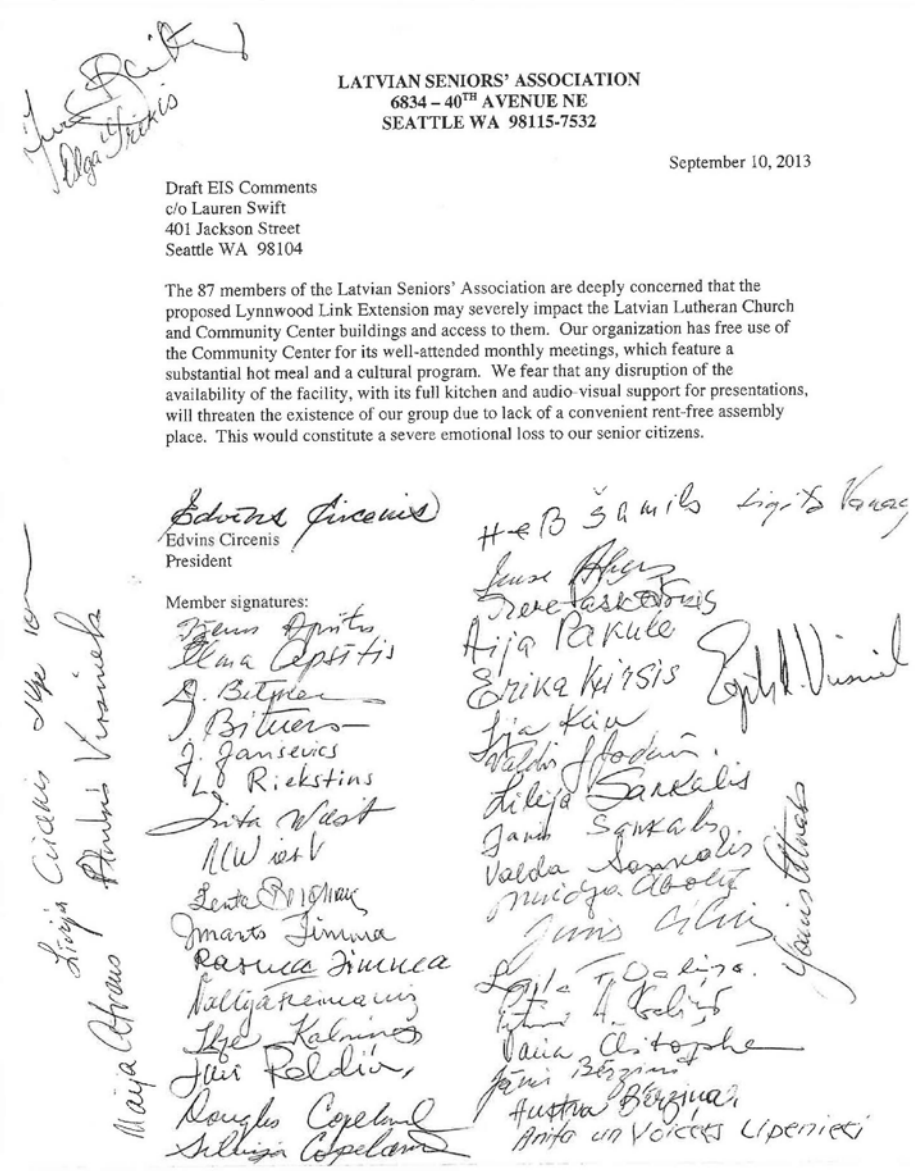
C-012-046

Thank you for your concerns about the potential displacement of the Latvian Evangelical Lutheran Church. Since the publication of the Lynnwood Link Extension Draft EIS in June 2013, additional engineering was undertaken to reduce adverse effects on the Latvian Evangelical Lutheran Church property and facilities. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained.

Several sections in the environmental document have been updated to address these changes including: Section 2.5.1 describes the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative. Construction of the light rail guideway in proximity to the Latvian Evangelical Lutheran Church would take approximately 1 to 2 years, a longer period for elevated alternatives.

Construction work would predominantly occur between 8 am and 6 pm during weekdays with occasional nighttime and weekend construction. Near-term construction activities would be communicated to adjacent property owners through a proactive community outreach plan and may include newsletters, Internet postings, community meetings, and direct contact by a Sound Transit representative. Reconstruction of the noise wall on the west edge of the church property would require negotiation of a temporary construction easement that would be negotiated prior to the start of construction. Sound Transit's intent is to maintain access to the church and community center for duration of construction, though the access may change somewhat from existing conditions for short periods.

C-012-047



LATVIAN SENIORS' ASSOCIATION
6834 – 40TH AVENUE NE
SEATTLE WA 98115-7532

September 10, 2013

Draft EIS Comments
c/o Lauren Swift
401 Jackson Street
Seattle WA 98104

The 87 members of the Latvian Seniors' Association are deeply concerned that the proposed Lynnwood Link Extension may severely impact the Latvian Lutheran Church and Community Center buildings and access to them. Our organization has free use of the Community Center for its well-attended monthly meetings, which feature a substantial hot meal and a cultural program. We fear that any disruption of the availability of the facility, with its full kitchen and audio-visual support for presentations, will threaten the existence of our group due to lack of a convenient rent-free assembly place. This would constitute a severe emotional loss to our senior citizens.

Edvins Circenis
President

Member signatures:

Short-term visual, air quality, and noise impacts would be avoided and minimized with the implementation of best management practices. These would include fencing the construction area for public safety, spraying the construction area with water to reduce dust, and use of temporary noise walls where practical. For additional information, see Sections 4.5.7, 4.6.7, and 4.7.7, respectively. As an adjacent property, the church property would be affected long term during operation of the light rail train, but impacts would be mitigated to allow for the continuance of ongoing cultural activities. The discussion of impacts in the Final EIS has been updated to reflect the refined alternatives. Access would be maintained to the property and the church and community center would remain. See Sections 3.2 and 3.6 that discuss these transportation impacts. With the required reconstruction of the noise wall, some vegetation would be removed from the property. See Sections 4.5.2 and 4.5.7 for additional information. Noise impacts also would vary by alternative. See Sections 4.7.3 and 4.7.7 for additional information on impacts and mitigation, respectively.

Laura Swift
401 S. Jackson Street

Seattle, WA 98104

C-012-048

As members of The Seattle Latvian Evangelical Lutheran Church/Center, and the founding members of the SLGA (Seattle Latvian Golf Association) we would like to express our concerns for the proposed future plans of our center. We have been organizing a golf tournament for the Baltic community over the past 12 years. We have just wrapped up our most recent golf tournament September 7th and participant levels continue to grow. This year tournament was played by 72 golfers with others on a waiting list. Following our golf tournament, golfers and their guests attend an awards banquet and dinner at our Latvian Center. Our tournament is held at Jackson Park Golf Course and the close proximity of the course to our Latvian Center has been instrumental in our continued ability to attract more Latvian golfers and their guests year over year. Our most recent awards banquet was attended by no less than 140 guests and a great time was had by all! Our concern stems from the very importance of our Latvian center being in close proximity to our tournament golf course (Jackson Park). We feel our tournament/ awards banquet will lose interest and momentum if the convenience for many Latvian community members (many of them elderly) is altered.

We appreciate the opportunity to express our concerns and await your reply,

Respectfully,

Rolands J Abermanis

Edmunds Leitis

C-012-048

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

KURSA
WEST COAST LATVIAN EDUCATION CENTER
P.O. Box 1221
W. 3381 Dayton-Airport Rd., Shelton, WA 98584

www.kursa.com / www.wclec.com / www.klavs.org

September 15, 2013

Sound Transit
Draft EIS Comments
401 S. Jackson St.
Seattle, WA 98104

Dear Sirs:

KURSA is the Latvian community's centerpiece school program to connect high school students of Latvian descent to their Latvian language and artistic traditions. It is hosted every year in July at the West Coast Latvian Education Center (WCLEC), a 160 acre camp facility outside of Shelton, Washington. Next summer, the 4 week program will begin its 40th educational year, and the 31st at the WCLEC.

Because of KURSA's length, the planning and preparation already begins in September for the school's opening in July of the following year. The academic program includes classes in language, literature, history, ethics, music and folk dancing. The students have an option in the afternoons to pursue embroidery, ceramics, stain glass and jewelry design with emphasis on integrating traditional Latvian design elements.

As you can imagine, the academic planning is a major undertaking every year, and it takes place at the Latvian Community Center in Seattle at Northgate. The Planning Committee's practise is to meet at least monthly, on Sunday's, after church services. Not only does this facilitate meeting with Latvian Evangelical Lutheran congregation members, but also with members of the Latvian Association of the State of Washington and parents of the Center's Latvian School. It is a convenient and effective way to remain in sync with our community, discuss our planning and seek community support when necessary.

In many ways, what we do as a community is not so unusual. In the Pacific Northwest, we continue to experience reminders of the driving power of language and culture. We see it especially among the Native Americans - from the Tulalip tribe dedicating their new Hibulb Cultural Center in Marysville, Washington, to the Klallam tribe compiling its first dictionary and having it published in 2012 by the University of Washington Press. We see it also in the Scandinavian community in Seattle which has embarked upon a major undertaking to build a new Nordic Heritage Museum with expanded space for its exhibits and cultural programs.

C-012-049

It is, therefore, with trepidation that we ponder the news that the Latvian Community Center may not exist when Sound Transit completes its light-rail from the University District, past Northgate, to Everett. The access which we have to the community through the Latvian Center is invaluable. The loss of the Center sets our community adrift after decades of shaping it character and its cultural life. KURSA's Planning Committee, therefore, urges Sound Transit to carefully review its light-rail options to minimize the impact on a thriving cultural community.

Sincerely yours,

Janis Rogainis, Interim Kursa Director and President of the WCLEC Board

C-012-049

Thank you for your concerns about the potential displacement of the Latvian Evangelical Lutheran Church and for highlighting its significance to the region's Baltic community. Since the publication of the Lynnwood Link Extension Draft EIS in June 2013, substantial additional engineering was undertaken to reduce adverse effects on the Latvian Evangelical Lutheran Church property and facilities. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained.

Several sections in the environmental document have been updated to address these changes including: Section 2.5.1 describes the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative. Compensation also would be provided if the alternative selected for construction would require acquisition of land or improvements as is required by the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970; the Washington State property acquisition policies and procedures in Chapter 8.26 Revised Code of Washington (RCW); and Sound Transit's adopted Real Property Acquisition and Relocation Policy, Procedures, and Guidelines.

WEST COAST LATVIAN EDUCATION CENTER
P.O. Box 1221
W. 3381 Dayton-Airport Rd., Shelton, WA 98584
www.wclec.org / www.wclec.com / www.kursa.org

September 15, 2013

Sound Transit
Draft EIS Comments
401 S. Jackson St.
Seattle, WA 98104

Dear Sirs:

The West Coast Latvian Education Center (WCLEC) is a 160 acre camp facility outside of Shelton, Washington. It was founded in 1983 as a non-profit 501(c)(3) corporation for the expressed purpose of fostering Latvian culture through educational activities and events. During July and August, for example, it hosts a heritage camp, „Mezotne", for children of Latvian descent and „Kursa", a Latvian language summer school for high school students. The programs attract children and teenagers from the United States and Canada.

Because of the character of the facility, and other Latvian events there in May, June and September, the WCLEC is an extension of the cultural center of the Latvian community in Washington State. That cultural center is the Latvian Community Center in Seattle at Northgate. Built in 1972, it is governed by the Community Center Board, the Seattle Latvian Evangelical Lutheran Church and the Latvian Association of the State of Washington.

These two facilities and their combined cultural and educational activities have shaped, over time, an integrated Latvian community. The Latvian church uses the WCLEC facility to host congregation events, the Community Center's Latvian School sends young people to WCLEC's Latvian camps, and WCLEC sponsored events over Memorial Day, in June and the camping weekend over Labor Day, attract Latvians both young and old to weekends of work, celebration, and just plain recreation in a beautiful wooded facility bordering Armstrong Lake. In parallel, WCLEC uses the Latvian Community Center for monthly business meetings, recruiting volunteers, publicizing WCLEC events and camps, fundraising, hosting a Valentine's Day dinner and movie night, and maintaining rapport with the Latvian community's older generation who were the principal creators, and financial supporters, of both facilities for all these years.

C-012-050

Thus, it is with dismay that the Board of the West Coast Latvian Education Center receives the news that the Latvian Community Center may not exist when Sound Transit completes its light-rail from the University District, past Northgate, to Everett. The loss of the Community Center puts at risk the integrated community we have so painstakingly built since the 1970's, the programs at WCLEC and the outreach to the community which the Center facilitates. The Board urges Sound Transit to carefully review its light-rail options to minimize the impact on a thriving community in this multi-cultural city of Seattle and in Washington State.

Sincerely yours,

Janis Rogainis, Interim Kursa Director and President of the WCLEC Board

C-012-050

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

September 20, 2013

To the Seattle Sound Transit Board Members,

C-013-001

I am writing regarding the proposed Lynnwood Link extension of the Sound Transit Link Light Rail system which, as currently under discussion, would impact the Seattle Latvian Center and Church at 11710 3rd Ave NE.

Although not a resident of Seattle or Washington State, I can attest that the Seattle Latvian Center serves not only area residents but also Latvian communities in British Columbia and Alberta, Canada. It is the closest active Latvian Center and resource for all of western Canada, and members of our Latvian community have certainly visited there over the years.

As a focal point for area Latvians for many decades, the Seattle Latvian Center enabled and encouraged its members to develop a strong, supportive sense of community with exceptionally viable music, dance and youth groups. These groups branched out by sharing their talents with other communities. Both Alberta and British Columbia have hosted Seattle performers at local Latvian events. The energetic Seattle youth who worked at Latvian summer camp in Shelton, WA, were a highly positive influence on my children, who grew up in a city with a much smaller Latvian population.

I applaud Seattle Sound Transit for striving to improve light rail access for its citizens. I ask that you consider such improvements in a manner than would enhance and maintain the current Seattle Latvian Center and the many communities it serves. In this case, a building is much more than a building. It's the core of a community that extends far beyond its physical boundaries.

Respectfully,

Ena Rudovics
President,
Edmonton Latvian Society "Imanta"
9308 - 82 Street
Edmonton AB T6C 2X5
Canada

C-013-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church to the Latvian community in western Canada. See Section 2.5.1 for a description of the refined Segment A alternatives that avoid displacing the church.

Sound Transit DEIS
Comments c/o Lauren Swift
401 S. Jackson Street
Seattle, WA 98104

Dear Sirs:

C-014-001

I am writing to express my concern regarding your planned expansion of the Northbound I-5 corridor and the impact it will have the adjacent community, and specifically the Latvian Community Center at 11710 3rd Ave, Seattle.

The West Coast Latvian Song Festival has been producing events for the Latvian community in the western United States since 1962. Seattle has been the site of numerous festivals which have been attended by thousands of Latvians and Americans from the throughout the Americas. The Latvian Center in Seattle has been a cornerstone staging area for most of these activities for the last 40 years. Moving or changing the existing edifice, accessibility or its location would have a severe negative impact on the organizing efforts of our community and would bring into question the feasibility of future festival activities.

I am confident the Latvians support the continued development of mass transit in the greater Seattle area and applaud the city's efforts in this regard. The West Coast Latvian Song Festival Executive Committee strongly urges you to consider developing projects in such a way that do not negatively impact the diverse communities that flourish Seattle.

With regards,

Dr. Paul Berkolds, Executive Director
West Coast Latvian Song Festival Executive Committee
Los Angeles, CA

copy

Pat McCarthy
Sound Transit Board Administration
401 So. Jackson Street
Seattle, Wa. 98104

September 14, 2013

Dear Ms Pat McCarthy,

C-015-001 We, the members of the Latvian Sorority GUNDEGA, have reviewed the Draft Environmental Impact Statement, attended the community meetings and we are now expressing our deep concern regarding the possible destruction of the Latvian Center and the Church, the cultural pillars of the long standing Latvian and Baltic community. Our sorority members have attended important and historical events at the Church and the Center to meet the presidents of the Baltic countries, to support the UW Baltic study program, to participate in religious services and educational gatherings, as well as to share in ethnic and personal life celebrations. The Church and the Center are the glue holding our organization and our community together, allowing it to grow while preserving Latvian ethnicity and culture. The Latvian sorority tradition dates back to1920s and remains an important part of the Latvian women's lives across generations. Interrupting or eliminating the access to the Church and the Center would severely disrupt our ability to continue our traditions and share our rich cultural heritage with the city of Seattle.

C-015-002 It is of utmost importance that the Lynwood Link Extension construction allows the continued access to the Center, that the caretaker's house is reconstructed and that there is a minimal long-term disruption to the Center's function due to noise disturbance.

Do not allow the proposed transit line to destroy the Latvian Center, Church and the Latvian community.
We have enclosed our signatures.

Sincerely,

Zaiga Alksne Phillips
The president, Latvian Sorority Gundega
10040 Ne 27th Street
Bellevue, Wa.98004

C-015-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. See Section 2.5.1 for a description of the refined Segment A alternatives that avoid displacing the church.

C-015-002

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Sound Transit
Comments c/o Lauren Swift
401 Jackson St
Seattle WA 98104

C-016-001

Having reviewed the Lynnwood Link Extension DEIS, I am very concerned that all of the proposed alternatives will severely impact the Latvian Church and Community Center and the activities of hundreds of families who consider it their „ethnic home".

As a Latvian language camp for 3 to 14 year olds, Mežotne draws its camp participants, counselors, and staff from the various Latvian communities along the West Coast, predominantly from the Seattle metropolitan area. The Latvian language and knowledge of our heritage is a critical staff requirement in order for the camp to function. Thus the continued existence of the Latvian Church and Community Center is of major importance to our existence as well. This is the place where our families have a common bond, a common history, and a language school for their children.

We are now in the third generation of community members born in the U.S. who are still highly immersed in the language and the culture of Latvia, while being just as involved in their American communities. It takes a great deal of effort, time, and money to live in two parallel cultures, and the Latvian community is doing it! We do not want that jeopardized!

Access to and continued use of the Latvian Church and Community Center during construction and long term operation of the Lynnwood Link Extension without undue noise and access problems needs to be guaranteed so that our community does not lose its continuity, so that we are not displaced by obstacles not under our control.

Respectfully yours,

Inese Graudiņš

Inese Graudiņš, Director
Mežotne, Latvian Children's Language Camp
inesegraudins@comcast.net

C-016-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. See Section 2.5.1 for a description of the refined Segment A alternatives that avoid displacing the church. Construction of the light rail guideway in proximity to the Latvian Evangelical Lutheran Church would take approximately 1 to 2 years.

Construction work would predominantly occur between 8 am and 6 pm during weekdays with occasional nighttime and weekend construction. Near-term construction activities would be communicated to adjacent property owners through a proactive community outreach plan and may include newsletters, Internet postings, community meetings, and direct contact by a Sound Transit representative. Reconstruction of the noise wall on the west edge of the church property would require negotiation of a temporary construction easement that would be negotiated prior to the start of construction. Sound Transit's intent is to maintain access to the church and community center during construction, although the access may shift as the realigned city street is constructed. Please see the following sections of the Final EIS regarding noise: Section 4.7.3 long term impacts, Section 4.7.4 construction impacts, and Section 4.7.7 for proposed mitigation measures.

185th STATION CITIZEN COMMITTEE
SHORELINE, WASHINGTON

September 10th, 2013

c/o Lauren Swift

401 S. Jackson Street

Seattle, WA. 98104

Dear Sound Transit Board,

On behalf of the 185th Station Citizen Committee (185SCC), I submit the following letter of comment concerning the Draft EIS report Sound Transit prepared for the Lynnwood Link Extension project.

The 185th Station Citizen Committee is a neighbor-led community group that helps to educate our neighborhoods about Sound Transit's plans; serves as a public forum to discuss the ramifications of these plans on our area; and then in turn functions as a liaison to Sound Transit to present our community's concerns, issues, and priorities. For the last year 185SCC has been working with the City of Shoreline, Futurewise and Senior Services to educate and collect public input comments about the design of the 185th Street Station and surrounding station-area. The comments listed in this letter reflect comments collected during three community visioning meetings, monthly public meetings, and four public outreach events.

The 185SCC commends the work that Sound Transit has conducted for the last two years resulting in the Lynnwood Link Extension DEIS.

C-017-001 As residents of the surrounding neighborhoods, we stand ready to embrace, work for, and support the creation of an integrated station area which fully connects and complements our neighborhood. Unfortunately, in reviewing the Lynnwood Link DEIS, we are greatly concerned by some of the options and details outlined. In broad terms, it would seem that the City of Shoreline is being asked to accommodate a large Park & Ride facility for a commuter railroad. While we recognize that one of the goals of Sound Transit's Light Rail system is to meet the needs of commuters, this is not its only use, nor the only goal identified by the Sound Transit Board. The station needs to support, and be oriented towards, the community; just as much as the community is ready to support the station.

1

C-017-001

The proposed parking facility at the NE 185th Street site was developed considering the project's objectives of good multi-modal connections to fast, frequent and reliable two-way transit service serving the corridor communities. The 500-space parking garage would be one element of access for a station expected to serve 6,600 daily riders, most of which are expected to be coming from the surrounding community via transit, biking or walking. Other proposed stations for the corridor at about 2 mile intervals also help distribute the need for parking. The overall station site for the Preferred Alternative features a parking garage that is adjacent to and west of I-5 and across the freeway from the station area. Other alternatives include a parking garage to the east of I-5, adjacent to the station. Sound Transit has also worked closely with the City of Shoreline, which has undergone its own station planning study and environmental review focusing on the areas surrounding the station.

We advocate for a complete and connected community around the future Link light rail station along I-5 at NE 185th Street. In general, we as a community have three goals for the final design of the 185th Street Station.

C-017-002

I. PUBLIC SAFETY & ACCESSIBILITY

First and foremost we want to ensure the safety of our neighbors and fellow travelers by prioritizing pedestrian, transit connectivity, and bicycle access to the station. We recognize that optimizing pedestrian access will also require an analysis of the transit stops surrounding the station to ensure maximum ridership. Studies show that out-of-vehicle waiting experience at transit stops can be even more important than in-vehicle experience (1).

C-017-003

II. TRANSIT-ORIENTED DEVELOPEMNT

Secondly, we want to increase the potential for transit oriented development (TOD) surrounding this station. Following Sound Transit's TOD policy, the station's conceptual design was analyzed 5 months ago to determine the potential for TOD, and it was found to be "limited" rising only to "moderate" assuming that a nearby landholder (Shoreline Schools) eventually transfers the property to be re-developed. This seems like a faulty assumption, since the presence of a light rail station is bound to encourage increased residential density and might require the school district to utilize its North City Elementary property. Most of the details proposed in the DEIS do not follow the Sound Transit Board's guidance to facilitate TOD strategies on its own property and in areas around its transit facilities (2).

III. STATION DESIGN

Finally, we want to minimize the visual and audible impact of the trains for the surrounding residential neighborhoods. We also wish to have a station that is inviting, serves as a focal point of our neighborhood, and reflects our community's cultural diversity.

C-017-004

The Draft EIS lays out 3 conceptual design options for the 185th Street Station and we strongly prefer the specific design features listed below:

2

C-017-002

Access to the proposed light rail stations for non-motorized users and feeder bus lines is described in Section 3.2 of the Final EIS. Features include pedestrian and bicycle access to and from feeder bus lines, park-and-ride facilities, and surrounding streets. Each station would include bicycle storage. Section 2.5.1 of the Final EIS describes factors affecting the range of alternatives, one of them being the maximization of existing transit infrastructure. Analysis of the existing regional transit including service characteristics, ridership, and travel times; transit level of service; and local and sub-regional transit is provided in Section 3.1.2. Section 3.2.2 provides an overview of long-term impacts to regional transit.

C-017-003

The Draft EIS considered TOD potential in the comparison of alternatives and impacts analysis, particularly in the assessment of potential indirect impacts related to the project. As noted in your letter, Sound Transit's TOD policy states that the agency will assess TOD during project development to help determine the potential for future development in and around a proposed station location. Assessments were conducted at all proposed station locations based on existing conditions. When the assessment was conducted for the Draft EIS, zoning around the NE 185th Street Station was primarily single-family residential. Shoreline has subsequently conducted a station area planning and environmental review process for the area, examining potential changes in the types of development that could be allowed in the station area, with the city's final plan updates occurring in 2015. For the Final EIS, Sound Transit updated the TOD report, which is available on the project web site. Implementation of TOD policy continues through final design, construction, and post construction. Implementation includes identifying TOD opportunities and strategies as well as partnerships with public and private interests as noted in Section 4.2.4 of the Draft EIS.

C-017-004
- We strongly prefer the at-grade train tracks and center platform design shown in Option 1. The vast majority of the public input we've collected in relation to track design preferred the at-grade option.

C-017-005
- When Sound Transit rebuilds the NE 185th St Bridge to install at-grade tracks (as shown in Option 1), enhanced pedestrian, bike and transit access should be prioritized. This should include covered walkways, bike lanes, and dedicated transit lanes.
- Encourage pedestrian safety and access by building sidewalks to/from the station.

C-017-006
- Add appropriate traffic control devices and/or design elements to promote safety for commuters, neighborhood residents, and vehicles at the redesigned intersection of NE 185th St and 5 Ave NE (as shown in option 1).
- Transit access loop turning into the station from 8th Ave NE and exiting the station via NE 185th St (as shown in Option 1).

C-017-007
- Parking garage to be located on the West side of I-5 along NE 185th St (as shown in Option 1).

C-017-008
- Reconfigure the station site (as shown in Option 1) to maximize potential Transit-Oriented-Development (TOD) immediately adjacent to the station.
    1. Move the bioretention cells currently located in the "Landscaped Area" if possible.
    2. Move service vehicle parking & ancillary buildings (locate south of/under the 185th St Bridge?) if possible.
    3. Rather than include a large (.75 acre) blank "Landscaped Area" next to the station, design to include a smaller town-square type public space-point to allow more room, and a focus for TOD.
- Enhance potential TOD development by designing station "overbuild" to provide commercial and/or community space above the station. Besides allowing the best possible integration of the station with local businesses, this would further shield the neighborhood from the sights and sounds of the highway and light rail.

C-017-009
- Include architectural and artistic elements to the station building and surrounding area to create a station with an aesthetic and 'personality' that reflect our community's cultural diversity. For instance, one suggestion that

3

C-017-004

Your preference for Option 1 for the NE 185th Street Station design is noted.

C-017-005

Section 2.4 of the Final EIS describes the typical features of light rail alternatives, including accommodations for pedestrians, bicyclists, and feeder bus services at light rail stations. Section 2.2 of the Final EIS has updates for the Preferred Alternative. Section 3.2 of the Final EIS discusses features of the proposed project as it relates transit features and non-motorized facilities, and describes the effects that are associated with the different alternatives. Further details are shown in the Conceptual Plans (Appendix F) and the *Transportation Technical Report,* both provided on CD with the Draft and Final EIS and available on the project website.

C-017-006

Thank you for your comments and recommendations for improved circulation and safety near the NE 185th Street Station. Design for the NE 185th Street Station area would include intersection traffic control to manage the many travel modes and access to the station.

C-017-007

Your preference for Option 1 is noted.

C-017-008

Thank you for your comment regarding transit-oriented development (TOD). Overbuilding of a station or parking garage to provide development opportunities involves a number of trade-offs. As you mentioned, the option to develop the stations in this way is allowed in Sound Transit's TOD Policy, and the current designs do not preclude the opportunity. Sound Transit will consider a joint development project if a

C-017-009 we received from the Korean community was to add a contemporary Korean pagoda roof top to the design.

C-017-010
- Our neighborhood prizes its many green spaces, and especially its trees. In designing the station, re-location of streets and services, and organizing the construction at the site we encourage Sound Transit to preserve as many of our mature trees as possible, and to re-plant the areas disturbed to restore and maintain our 'urban forest'.

C-017-011
- Consider shifting the station (as shown in Option 1) towards the south approximately 150 feet, partially "under" the 185th St Bridge so east bound pedestrian and bicycle traffic on NE 185th St can access the station via an escalator. This would decrease the amount of vehicles making left turns into the station, and significantly reduce the number people needing to use the crosswalk across NE 185th St - a busy arterial that will become more congested with the opening of the station.

Thank you for your consideration. We look forward to working with Sound Transit and representing the needs of our community as the design process for the 185th Street Station moves forward. We accept that great changes are coming to our neighborhoods with the arrival of Light Rail, and we understand that many more commuters will begin travelling through our community. However, as the future neighbors of a Sound Transit Station we remain dedicated to the idea that this must be much more than a commuter-centric park-and-ride. We need you to work with us so that this station will be a vital community hub as part of the entire regional public transit system. It is what our neighborhood demands and deserves. We hope that together with Sound Transit and the City of Shoreline we can create a truly great station, station area, and transit-oriented neighborhood.

Sincerely,

Suzanne Wynne
Co-Chair, 185th Station Citizen Committee

References:
1) http://www.transitwiki.org/TransitWiki/index.php?title=Pedestrian_connections
2) http://www.soundtransit.org/Documents/pdf/about/board/resolutions/2012/Reso2012-24-Attachment%20A.pdf

4

number of conditions are met, including having an interested development partner. Currently, there have been no proposals from parties interested in joint development at the Lynnwood Link Extension stations, but Sound Transit will continue to investigate possibilities.

C-017-009

In Section 4.5.2 of the Draft EIS, it states that Sound Transit would develop design criteria with input from local jurisdictions and WSDOT; and Sound Transit would adhere to the local jurisdiction's design standards in station areas, if applicable, to promote visual unity in these areas.

C-017-010

Sound Transit will comply with all applicable tree protection standards in City of Shoreline Municipal Code 20.50 Subchapter 5. Sound Transit would minimize vegetation clearing, as noted in Section 4.8.6 of the Draft EIS.

C-017-011

In the Final EIS, all alternatives include a station at NE 185th Street to the north. Because siting of a station requires a straight track, an alignment south of NE 185th Street is infeasible. The Final EIS Chapter 2 has more detail on the Preferred Alternative.

SEA SHORE Transportation Forum

September 12, 2013

Ms. Lauren Swift
Sound Transit
401 S. Jackson Street
Seattle, WA 98104

RE: Lynnwood Link Draft Environmental Impact Statement

Dear Ms. Swift:

On behalf of the SeaShore Transportation Forum, an advisory board of elected officials from Seattle, Shoreline, Lake Forest Park, Kenmore, Bothell, Woodinville, Edmonds, Mountlake Terrace, King County, and Snohomish County, we are writing to provide our input on the station locations being considered for Sound Transit's Lynnwood Link extension as part of the Draft Environmental Impact Statement (DEIS). Several of our member jurisdictions have already provided input, but we wanted to add our comments that reflect our mutual positions.

C-018-001 The SeaShore Transportation Forum supports stations at 145th and 185th, and suggests that Sound Transit should give strong consideration to an additional station at 130th if the funds are available. In addition, the SeaShore Transportation Forum supports the eastern alternative for the Mountlake Terrace station over the freeway alternative.

C-018-002 In addition to support for these station locations, we want to emphasize the importance of providing access to transit, including local bus feeder service and enhanced bicycle and pedestrian facilities to improve the transfer experience. We strongly encourage Sound Transit and its transit partners to look at the entire system when making decisions such as where to locate parking facilities and the requisite size of the facilities with the goal of improved access for all modes and reduced congestion near the stations. Transit oriented development at key station locations should also be considered as a way to increase access to transit.

C-018-001

Your preference for stations at NE 145th Street and NE 185th Street, and support for further consideration of a station at NE 130th Street is noted. In November 2013, the Sound Transit Board identified an at-grade and elevated alignment with stations at NE 145th and NE 185th streets (Alternative A1 with modifications) as the Preferred Alternative in Segment A. The Board also directed further study of options to add a station at NE 130th Street or to make provisions for a future station. The Sound Transit Board identified an elevated station crossing over NE 236th Street east of I-5 as the station alignment for the Preferred Alternative in Segment B. The freeway station remains part of Alternative B4. The 130th Street Station remains part of the other A alternatives (A5, A7, A10, A11) aside from the Preferred Alternative.

C-018-002

Sound Transit designed the project to provide good access for all modes, and worked with local jurisdictions and transit agencies to identify effective station sites and access plans for the proposed alternatives. Access to the proposed light rail stations for non-motorized users and feeder bus lines is described in Section 3.2 of the Draft EIS. Features include pedestrian and bicycle access to and from feeder bus lines, park-and-ride facilities, and surrounding streets. Each station would have bicycle storage. Section 2.6.1 of the Draft EIS describes factors affecting the range of alternatives, one of them being the maximization of existing transit infrastructure. Analysis of the existing regional transit including service characteristics, ridership, and travel times; transit level of service; and local and sub-regional transit is provided in Section 3.1.2. Section 3.2.2 provides an overview of long-term impacts to regional transit.

Implementation of TOD policy continues through final design, construction, and post construction. Implementation includes identifying

We hope that the Sound Transit Board will consider this input as it makes decisions about station locations and related transit improvements.

Thank you for your consideration.

Sincerely,

John Wright

Tel. (301)340-7646, e-mail: pblaASV@verizon.net

August 29, 2013

Sound Transit
Comments c/o Lauren Swift
401 Jackson St.
Seattle. WA 98104

To whom it may concern:

C-019-001 It has come to our attention that with the extension of the Sound Transit system in the Seattle area the Latvian church and community house may perish. The World Federation of Free Latvians (WFFL), which is the umbrella organization for Latvian communities outside of Latvia, and among whose duties it is to preserve the Latvian heritage - language and culture - as long as possible, hopes that an alternate solution can be found and this particular property will stay unaffected.

The Latvian community in the USA is not a large one and with every passing year, it is more and more challenging for the various Latvian groups to maintain their churches and community centers. The Latvian church and community center in Seattle is particularly important as it is the only one is the state of Washington.

Please give this matter your closest attention and consideration.

Respectfully yours,

Jānis Kukainis
President, WFFL

C-019-001

After the publication of the Draft EIS, the Sound Transit Board subsequently directed Sound Transit to explore a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained, although a small portion of land on the property's edge would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property, but an elevated design by the church is not the Preferred Alternative.

Several sections in the Final EIS have been updated to address these changes including: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

Ms. Pat McCarthy, Chair of the Board
Sound Transit
County – City Building, Room 737
930 Tacoma Avenue South
Tacoma, WA 98402-2100
U. S. A.

August 16th, 2013

Ms. Pat MacCarthy, Chair of the Board, Sound Transit

Dear Ms. McCarthy,

C-020-001

We have learned, with concern, about the probable adverse effects of a proposed train line on our Seattle Latvian Lutheran Church.

This congregation is a key element for us not only in the US Pacific Northwest, but for our Church in general.

The Seattle congregation also is historically significant to our Church. The late archbishop Dr. Kārlis Kundziņš was part of the congregation while the head of the entire Latvian Evangelical Lutheran Church Outside Latvia. Also, my predecessor archbishop Arnolds Lūsis was consecrated here.

Our Seattle congregation not only provides spiritual care for over 300 members and shelters a school, but its social hall is used for a wide range of religious, cultural and education events.

The Seattle Estonian Lutheran Congregation also has its regular services in the church.

Forcing the congregation from its property, or even compromising its ability to function effectively because of loss of space, or because of noise and vibration, would deal a blow to the community from which it may not recover. Please consider the effects of this on the membership – particularly children, youth and the elderly.

Please choose construction alternatives which would allow this church and community to continue its important work.

Sincerely yours

+ Elmārs Ernsts Rozītis
Archbishop

EVANGELISCH-LUTHERISCHE KIRCHE LETTLANDS IM AUSLAND
LATVIJAS EVANGĒLISKI LUTERISKĀ BAZNĪCA ĀRPUS LATVIJAS
2. Kor. 12,9

C-020-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes including: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations. Section 4.7.3 of the Final EIS discusses noise and vibration impacts and Section 4.7.7 describes the proposed mitigation measures that would be applied.

EELK SEATTLE KOGUDUS

Seattle Congregation of the Estonian Ev. Lutheran Church

(Services at the **Latvian Lutheran Church**)

Sound Transit, Comments

c/o Lauren Swift

401 Jackson Street

Seattle, Washington 98104

Dear Folks at Sound Transit!

C-021-001

We have just received some most disturbing news: that you are planning to take away the driveway of the Latvian Lutheran Church at Northgate. That would remove any access to that beautiful and essential building, rendering it totally useless! Please, please try to do what you have to do in some other way! Our Estonian Congregation and other cultural organizations have been using that facility for many years!

Thanking you for your consideration,

Sincerely yours,

The Rev. Hendrik Laur, Pastor

September 11, 2013

C: The Rev. Daira Cilnis

C-021-001

The Sound Transit Board directed Sound Transit to explore a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering that Sound Transit undertook to avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained, although a small portion of land on the property's edge would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property, but the existing roadway access would remain in place.

Several sections in the Final EIS have been updated to address these changes including: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

Sound Transit
401 South Jackson Street
Seattle, WA 98104

Dear Transit Board:

Please do all you can to preserve the dignity of the Latvian Community Center and Church. We respectfully request that the Latvian Center remain at its present location and that it remain accessible to the Baltic community during link construction.

C-022-001

The Latvian Center serves as the heart of the Baltic community in the Seattle area. The Center is where we come to:

- Celebrate our heritage and teach our children the Estonian, Latvian and Lithuanian languages;
- Give back to our community by raising funds for the University of Washington Baltic Program (one of only a handful of University programs in the United States that teaches Estonian, Latvian, and Lithuanian languages, literature, and culture);
- Honor our fallen veterans who fought for independence in Estonia, Latvian, and Lithuania against the Soviets;
- Honor our veterans who fought in Korea (most not yet citizens), Vietnam, and the Gulf Wars; and Afghanistan;
- Welcome newly minted U.S. citizens who have immigrated from Estonia, Latvian, and Lithuania, helping them to acclimate to the United States;
- Remember the thousands forcibly deported to Siberia, many never to return to their native land;
- Host visiting dignitaries, notably the Presidents of and Ambassadors from Estonia, Latvian and Lithuania (the Latvian Center is no stranger to Secret Service agents conducting security sweeps).
- Celebrate christenings and weddings, and mourn our fallen friends.

Looking back to our homelands is not an exercise in history; many members of our Estonian, Latvian, and Lithuanian communities are first generation immigrants who know what it means to have their homeland stolen by the Soviets, fight for that homeland, and live to see it independent once again.

The Seattle Estonian Society, which represents Estonians across Washington State, but has the greatest proportion of members in Seattle, earnestly requests that you consider the reverberating consequences of closing the Latvian Community Center. We respectfully request that the Latvian Center remain at its present location and that it remain accessible to the community during link construction.

In hope of a positive response,

Ene Kristi Urv-Wong
President
Seattle Estonian Society

Delivered via email to: LynnwoodLinkDEIS@soundtransit.org

RE: Parkwood Neighborhood Association Comments on the Draft EIS for the Lynnwood Link Extension

Dear Ms. Swift,

The Parkwood Neighborhood Association is pleased to have the opportunity to submit these comments on the Draft Environmental Impact Statement for the Lynnwood Link Extension. The location of Shoreline's Parkwood Neighborhood on the west side of I-5 (opposite the proposed light rail line but within close proximity to both the 145th and 155th proposed stations) means that our neighborhood would experience few direct impacts from the physical placement of either station and the light rail line on the east side of I-5, but could be subject to indirect impacts to traffic, mobility (walking, biking, and bus transit), schools, Twin Ponds Park, and the natural environment. With these factors in mind, we have focused our review of the Draft EIS and our comments by identifying potential impacts to the Parkwood Neighborhood from the stations proposed at 145th and 155th streets.

C-023-001

Traffic Impacts: Both stations would increase traffic and local street congestion in our neighborhood during peak commute times. Parkwood Elementary School is located on the south side of N. 155th St. (at Wallingford Ave. N) within one-half mile of the proposed 155th station. Increased traffic on 155th is a safety concern for our students at pedestrian crosswalks located at Meridian Ave. N and at Wallingford Ave. N and also for bus and parent drop-off/pick-up traffic at the school. In addition, the 20 mph speed limit on 155th within the school zone would cause backups and increase traffic congestion for commuters heading to and from the 155th Station during portions of the morning commute that overlap with the beginning and end of the school day. School crossing guards and a lighted crosswalk currently stop traffic for students crossing at 155th and Wallingford in front of the school. This busy crossing would further delay commuter traffic to and from the 155th station and increase the risk to students crossing at this intersection. Adding a traffic signal at Wallingford might improve pedestrian safety but may not ease congestion on 155th and may prove to be problematic because of the steep hill and poor sight distance on 155th. In contrast, a station located at 145th would avoid these traffic impacts because the posted speed limit is 35 mph, and the entrance to Lakeside School is off of 1st Ave NE in Seattle.

Our familiarity with neighborhood traffic patterns suggests that both the 145th and the 155th stations would increase traffic on both Meridian Ave. N and on 1st Ave. NE as commuters seek out neighborhood streets for routes to the north and south. The 155th station could result in more traffic impacts to Meridian Ave. N and to 1st Ave. NE because there are no freeway ramps at

C-023-001

Traffic impacts and multi-modal conflicts were addressed in the Draft EIS and updated in the Final EIS. The Sound Transit Board identified the NE 145th Street Station as part of the Preferred Alternative rather than the NE 155th Street Station, although the Final EIS continues to evaluate all of the alternatives. The Sound Transit Board will ultimately determine the alternative to implement and the project to be built after the Final EIS has been issued.

C-023-001 155th like there are at 145th. The Evergreen Elementary School is located on Meridian Ave. N between 145th and 155th and is already a source of traffic congestions on Meridian due to student traffic and the 20 mph speed limit when school is in session. We are concerned that both station locations would add to the existing traffic congestion on Meridian and compromise the safety of Evergreen students. Regardless of which station is chosen, Impacts to Meridian Ave. N and 1st Ave. NE will require careful consideration and possible mitigation. It helps put the potential traffic impacts on the schools and local roads in perspective by considering that the anticipated boardings at the 155th station (and the increase in people moving through our neighborhood) is about twice the combined student body population of the Parkwood and Evergreen elementary schools (700 students) that are an existing source of traffic congestion. A station at 155th would essentially add the traffic of two more elementary schools to our neighborhood.

We feel that a station located at 145th would result in fewer traffic impacts to our neighborhood than a station located at 155th because 155th lacks freeway ramps and because 145th is a major arterial with four lanes of traffic and higher speed limit. Most traffic on 155th is currently local and not tied to I-5. In contrast, 145th is used for both local, cross-town traffic and for access to I-5. Presumably some of the commuter traffic on 145th bound for I-5 would instead go to the 145th station or be replaced by public transit, biking, and walking. Traffic volumes on 145th are considerably higher than 155th, so any increase in traffic on 145th caused by a light rail station there would be relatively less compared to the increased traffic on 155th caused by a station at 155th. In addition, 145th is better suited for a station because the road provides better eastward connectivity to communities located beyond Lake City Way, whereas 155th ends at 15th Ave. NE and forces eastbound traffic to split north and south around Fircrest and Hamlin Park.

C-023-002 Regardless of the station location, the station design should discourage automobile use (by constructing smaller parking garages than proposed in the Draft EIS) and encourage infrastructure improvements that favor alternative means of transportation such as bus, bikes, and walking. Because the City of Seattle has prohibited a parking structure at the 130th station, a 500- to 650-car parking garage at 145th would draw more vehicles to Shoreline's 145th station under Alternatives A10 and A11 (which also include a station at 130th). We prefer smaller parking garages at the Shoreline stations to reduce vehicle traffic on our neighborhood streets, reduce property acquisitions in the Ridgecrest neighborhood, and to preserve the character and

C-023-003 safety of our neighborhoods. The station designs should also consider the potential for increased cut-through traffic on residential streets and mitigate these impacts with traffic-calming or other measures. In particular, we are concerned about cut-through traffic on N 147th and N 148th streets between 1st Ave. NE and Meridian Ave. N. for a station located at 145th and cut-through traffic on Corliss Ave. N and N 160th St. for a station located at 155th.

C-023-004 **Pedestrian and Bike Accessibility:** Both the 145th and 155th stations will increase pedestrian and bicycle activity in the Parkwood Neighborhood, which are more desirable modes of travel than vehicular traffic and the parking facilities that would be needed for cars. Bicycle access to the 145th station location is currently poor due to a lack of existing bike facilities in the area, the dangerous sidewalks and limited right of way along 145th, and the poor connectivity of neighborhood streets imposed by I-5 and the hilly topography. Although future bike facilities

C-023-002

As described in Section 2.3 of the Final EIS, station access is intended to serve a variety of user types including non-motorized users, those commuting by automobile, and those arriving on bus. Park-and-ride spaces are part of a balanced approach to access, and they can help minimize parking impacts to neighborhoods while providing access to light rail for areas transitioning from suburban to urban densities. Consistent with its adopted System Access Policy, Sound Transit will continue to refine the station access plans for the project during final design.

C-023-003

In the areas that you reference, the potential for cut-through traffic may exist with or without the light rail project and parking garages. Along N 145th Street, the potential would be related to how existing signals operate (and where left-turn pockets are available) for southbound traffic accessing N 145th Street; as well as the reverse movement, i.e., northbound traffic from N 145th Street accessing Meridian Avenue. General traffic could seek cut-through routes between these two points, not just light rail station traffic. Likewise, the second location noted on Corliss at N 160th is a location with a pre-existing issue related to cut through traffic.

At NE 148th Street between 5th and 8th Avenues, near the 145th Street station, there is the potential for cut through traffic more directly related to station traffic.

In Section 3.6.4, the EIS notes that in areas where cut-through traffic due to the stations may occur, signage as well as more active calming treatments could be considered, and Sound Transit would coordinate with the City to determine the most appropriate measures.

C-023-004 connecting to 145th are planned by the City of Shoreline on Meridian Ave. N and 5th Ave. NE, safe access for pedestrians and cyclists from these streets to the 145th station would need to be provided along 145th, where sidewalks are dangerously narrow and lack any sort of buffer from four lanes of 35-mph traffic. Creating space for pedestrian and bike facilities along 145th would need to consider a road diet, property acquisition, or a combination of both. Alternatively, east-west bicycle traffic could be routed one block north and south of 145th to neighborhood streets converted to greenways with safer east-west connectivity to regional bike facilities. Both options would require widening the sidewalk on the north side of the 145th overpass at I-5 or adding a new pedestrian/bike bridge over I-5 to replace the dangerously narrow sidewalk. In lieu of improvements to 145th, Parkwood residents that choose to bike or walk to the 145th station might be best served by a pedestrian and bicycle trail that parallels the west side of the southbound I-5 exit ramp and connects with the east end of NE 147th St. and leads safely to bike facilities and sidewalks along 1st Ave. NE and established bike facilities along 155th (which connects with the Interurban Trail). This trail could also be extended south, combined with the partial daylighting of Thornton Creek behind Aegis, and connected to the trail through Twin Ponds Park.

C-023-005 **Twin Ponds Park:** Both stations would increase traffic on 1st Ave. NE and impact the character of Twin Ponds Park and the park amenities. Parking along 1st Ave. NE is already at capacity during soccer games and is a safety concern with vehicle loading and unloading along the road. Increased traffic on 1st Ave. NE would also impact the safety of senior residents from Aegis that periodically cross the street to visit Twin Ponds Park. Parking restrictions would need to be imposed at the park to prevent overflow parking from a station located only one block away on 155th. Regardless of which station is selected, sidewalks should be extended along the entire length of 1st Ave. NE from 145th to 155th to increase walkability to the light rail station and pedestrian safety. More crosswalks and a lighted, pedestrian-activated crosswalk on 1st Ave. NE would address some of these safety concerns.

C-023-006 **Natural Environment:** As indicated previously, daylighting portions of Thornton Creek along a new pedestrian and bike trail west of the freeway would encourage mobility to either station while improving aquatic and riparian habitat and providing a natural amenity for the residents of Parkwood. Pedestrian use of the existing trail through Twin Ponds Park from Meridian Ave. (across from the Evergreen School) might also increase under either station option. Widening, lighting, and other improvements to this trail would encourage walking to either station. Extending a new trail spur eastward to 1st Ave. NE south of the ponds would also encourage walking to the 145th station.

C-023-007 **Summary:** Based on a consideration of both the impacts and the benefits of the Segment A Alternatives, the majority of the Parkwood Neighborhood Association Board favors a station located at NE 145th Street. Alternatives A1 and A3 (145th station) would result in similar impacts to Parkwood, and so we do not strongly favor one of these alternatives over the other. Alternatives A10 and A11 (Stations at 130th and 145th) could result in fewer impacts to Parkwood due to reduced boardings anticipated at 145th relative to other alternatives; however, the station footprint at 145th would be comparable to Alternatives A1 and A3. Consequently, we do not have a strong preference for Alternatives A10/A11 over Alternatives A1/A3. Alternatives

C-023-004

The streets reconstructed with the project would meet applicable city standards, which typically include sidewalks providing for pedestrian and bicycle use; station access plans also are considering all modes of access, including bicycling and walking. The Draft EIS Transportation Technical Report includes an inventory of pedestrian facilities within 1/2 mile of stations and bicycle facilities within 1 mile of stations. This inventory helped Sound Transit work with local jurisdictions on pedestrian and bicycle access planning in the station areas.

C-023-005

The NE 155th Street Station is one of the alternative station locations with the lowest forecasted ridership and therefore one of the lower pedestrian volume estimates. The estimated future PM peak hour period volume leaving the NE 155th Street Station is estimated at approximately 40 pedestrians per hour, based on the ridership forecasts (other riders are assumed to transfer to bus or are park-and-ride patrons). The pedestrians will primarily walk to the east and west from the station. While many pedestrian amenities are desirable near stations, the volume at the NE 155th Street Station is not anticipated to result in an impact to existing facilities.

The station garage is expected to accommodate the projected demand for park-and-ride; however, if the demand for transit increases, it is possible that all day parking of transit riders could occur where on-street parking is available within walking distance of the station. Section 3.6.7 of the EIS identifies measures that could be applied to discourage parking by transit users in the station areas For example, signs restricting parking duration could be installed at Twin Ponds Park and along 1st Avenue NE.

C-023-006

Sound Transit appreciates your suggestions for park, trail and other

C-023-007 A5 and A7 (155th station) would have the greatest adverse impact on the Parkwood neighborhood while not serving local transit needs as much as other stations because the low anticipated boardings.

The Parkwood Neighborhood Association appreciates the opportunity to comment on the 145th and 155th station alternatives for the Draft Environmental Impact Statement for the Lynnwood Link Extension. We welcome Light Rail to the community because of the many benefits it will provide long into the future. We encourage Sound Transit to work the cities of Seattle and Shoreline and King County Metro Transit to encourage walking, biking, and bus transit over cars to get people to and from the stations. The Parkwood Neighborhood Association is committed to working with Sound Transit and the City of Shoreline to identify potential impacts to our neighborhood and to work collaboratively toward solutions that best serve the needs of our community.

Sincerely,

Chris Brummer, Parkwood Neighborhood Association Light Rail Committee Chair
Katie Schielke, Parkwood Neighborhood Association Chair

neighborhood amenities that could complement the regional investment in a light rail station serving the area. However, such improvements are beyond the scope of the proposed project.

C-023-007

Thank you for your comments on the Lynnwood Link Extension Draft EIS. Sound Transit acknowledges your preference for a station at NE 145th Street and your discussion of the pros and cons associated with the Segment A station alternatives. The Final EIS evaluates all the alternatives evaluated in the Draft EIS (with updated analysis when needed). The Final EIS also evaluates the Preferred Alternative the Sound Transit Board identified in November 2013, with a station at NE 145th Street.

Sound Transit
DEIS Comments c/o Lauren Swift
401 S. Jackson Street
Seattle, WA 98104

September 22, 2013

Dear Ms. Swift,

I am writing to you as a representative of the 145th/155th Street Station Citizens Committee. We are a group of neighbors who have recently formed to share information and ideas about the coming light rail and to be involved as much as we can in the process of reshaping our part of Shoreline. We all live in the Ridgecrest or Parkwood neighborhoods, both of which stand to see significant changes as a result of the light rail station. We are excited at the thought of rapid transit at our doorsteps, yet at the same time we have many concerns and questions about how it will affect our neighborhoods. Thank you for the opportunity to provide feedback on the Lynnwood Link Extension Draft Environmental Impact Statement.

Though not all members of our committee agree about which proposed station location will be best for the neighborhoods, our comments favoring both stations are outlined below.

C-024-001 General comments favoring the 155th station location:

- A station at 155th would split the impacts on the neighborhoods more evenly
- A station at 155th is more central to southern Shoreline, allowing more residents easy access
- A station at 155th is closer to Shoreline businesses
- 155th street already has bike lanes and turn lanes in place

C-024-002 General comments favoring the 145th station location:

- A station at 145th would allow for the redevelopment of 145th street (which is already badly needed) which won't happen if the station is located at 155th
- The 145th location has more room available around the interchange area for parking and fewer houses will be lost
- Station construction will make a smaller impact upon both Seattle and Shoreline residential areas at this location and the result will have a positive impact upon community development with minimum disruption
- Station development/art/grounds development are more open, do not require massive habitat removal, and place smaller commuter pressure from the surrounding neighborhood arterials

Though we do not unanimously agree on station location, we are united in our concerns for impacts to both neighborhoods. The remainder of this letter details our feedback on each of the relevant sections of the DEIS.

C-024-001

Your reasons for favoring a station at 155th Street are noted.

C-024-002

Your reasons favoring a NE 145th Street Station location are noted.

C-024-003 Acquisition – property impacts

We would like to request that the fewest possible number of residents be displaced, and that the fewest possible number of properties be taken for the light rail line and the stations combined.

C-024-004 Land use

Shoreline was recently named a Tree City, USA. We would like to request that Sound Transit retain as many trees as possible.

C-024-005 Economics

We would like to request that Sound Transit pay special attention to commercial traffic during construction, and to mitigate negative impacts such as noise, dirt, and heavy loads on residential streets.

Some members view a 155th street station to be a better location for Shoreline business. In particular, the 155th street location is a direct line to the proposed Aurora Square redevelopment project.

Neighborhoods

Many of the concerns we discussed are about safety:

C-024-006
- Many residents have expressed opposition to a parking garage at the station location, as it will encourage more traffic

C-024-007
- Concern that the homeless population will be drawn to the station as a refuge
- Concern about an increase in crime around the station
- Concern about the safety of school crossings as more traffic comes into neighborhoods
- Concern about the lack of adequate sidewalks and crosswalks at intersections
- Concern about inadequate lighting in and near stations

C-024-008
- Concern that increased traffic at 145th will result in using side streets as "cut-throughs"

C-024-009
- Concern that light rail tracks may create a divide between east and west Shoreline

C-024-010
- Suggestion to mitigate traffic impacts by adding traffic circles to discourage "cut-throughs"
- Concern about increased traffic in general, no matter where a station is located

C-024-011
- Request to separate pedestrian walkways from vehicle traffic on major streets leading to a station

Visual and Aesthetic Resources

We have concerns about trees, noise, and views:

C-024-012
- Concern in general about tree loss
- Request to preserve as many existing trees as possible on 5th Ave NE
- Request to replace any removed trees with mature trees
- Request that the rail line be at grade as much as possible
- Request mitigation in upper Ridgecrest for noise and views

C-024-003

As described in Chapter 2, Alternatives Considered (Section 2.6.1), Sound Transit's planning of the alternatives emphasized opportunities to minimize environmental impacts, particularly property acquisitions and displacements.

C-024-004

Sound Transit will comply with all applicable tree protection standards in City of Shoreline Municipal Code 20.50 Subchapter 5 and minimize vegetation and tree removal to the extent practical.

C-024-005

Mitigation measures to reduce impacts to residential streets during construction are described in Section 3.6 of the Draft EIS. The members' preference for 155th Station due to better access to existing businesses is noted.

C-024-006

Sound Transit would mitigate impacts on NE 145th Street or NE 155th Street as a result of additional traffic using the park-and-ride garages. Please refer to the Final EIS.

C-024-007

Sound Transit maintains all of its stations to ensure they remain clean and safe. The stations will be well lit, feature security cameras, and are regularly monitored in person by security personnel. As described in Section 4.14 of the Draft EIS, crime is not expected to increase as a result of operation of the stations, in part because of project design and because most areas in the project corridor have low crime rates. Presence on station platforms requires proof of fare payment and fare-paid areas will be regularly patrolled by fare inspectors and security personnel.

C-024-012

- Concern about westerly views from Ridgecrest

Air Quality and Greenhouse Gases

C-024-013 We have several requests to address concerns that increased traffic around stations will degrade air quality during and after construction:

- Request design of parking structures is easy-in, easy-out to minimize exhaust
- Request dedicated freeway ramps to and from parking structures
- Request adequate dedicated motorcycle parking
- Request adequate bike stalls

Noise and Vibration

C-024-014 We are concerned that removal of many trees will increase freeway noise for many neighbors. As a mitigation, we would like to request replanting of trees along the rail line and up into the Ridgecrest neighborhood.

Ecosystem Resources

C-024-015 We would like Sound Transit to address any potential issues from runoff, and request that there is continued monitoring of streams that light rail will cross for pollutants.

Water Resources

C-024-016 We request permeable sidewalks and driveways at the station to help minimize increased runoff caused by the station footprint.

Energy Impacts

C-024-017 We request that utilities to and from the station be run underground, and that solar energy be used where possible to power stations.

Geology and Soils

C-024-018 We have two concerns here: Ridgecrest Community Park and the two peat bog parks. We believe Ridgecrest Community Park could be destabilized by constructions and regrading, so we would like Sound Transit to ensure a soil study is done here.

Twin Ponds Park and Ronald Bog Park have peat bogs. We have questions about whether vibration may adversely affect the soil under those parks.

Parks and Recreation

C-024-019 Our concerns here are mainly about Ridgecrest Community Park:

- What about the existing berm and trees? We would like those to be replaced

None of the alternatives would have an operating school close by and they would not affect travel times or routes for school buses. Lakeside School is the closest school to a station (NE 145th Street Station). As described in Section 4.14.2 of the Draft EIS, the safety-related improvements (sidewalks and protected crossings) to serve all pedestrians accessing the station would also improve the walking environment for Lakeside students. Section 3.6.9 of the Draft EIS discusses notification and communication with school officials so they may provide advanced and ongoing notice to students and parents concerning construction near schools.

C-024-008

As described in Section 3.6.4 of the Draft EIS, measures to address cut-through traffic impacts could include signage, traffic calming measures or other cut-through restrictions, and would be determined in conjunction with local jurisdictions.

C-024-009

Sound Transit evaluated the potential for disruption or separation of the community in the Draft EIS in Section 4.4 Social Impacts, Community Facilities, and Neighborhoods. In Section 4.4.1, the point is made that the City of Shoreline is currently bisected by I-5, which limits the east-west street network. Tall trees, sound barriers, and the noise of vehicular traffic further define this existing line in the city. The light rail project would not remove east-west connection points over the freeway. Stations at major arterial crossings is more likely to encourage east-west movements within the community. Please see Section 4.4.2 for more information.

C-024-010

Please see response to C-024-008.

C-024-019

- Request that Sound Transit ensure that the playing fields remain the same size
- Request that Sound Transit ensure to replace any lost public land with new public land
- Request that Sound Transit mitigate noise in the park

Thank you in advance for considering our comments. All of the members of our committee look forward to providing additional input as the plans for the station move forward.

Sincerely,

Robin Lombard for the 145th/155th Street Station Citizens Committee

C-024-011

As described in Section 3.2.5 of the Final EIS, Sound Transit would provide pedestrian and bicycle improvements at Lynnwood Link Extension stations consistent with its current System Access Policy to safely accommodate projected increases in pedestrian and bicycle travel associated with the project. Sound Transit would also work with local agencies to determine which pedestrian and bicycle improvements would be most appropriate to support station access and safety. Any new facilities would be designed and constructed to meet or exceed local jurisdictional standards for pedestrian and bicycle mobility.

C-024-012

Tree loss was discussed in the Draft EIS discussion (loss of mature vegetation in Viewshed 5) on pages 4-77 and 4-78. Mitigation measures such as preserving trees and replanting vegetation is discussed in the Draft EIS on page 94. Planting of mature trees is generally not recommended due to lower levels of survival of larger specimens, but other measures to help soften the initial impacts as replacement vegetation matures are available. See section 4.5.6 of the Final EIS for an updated discussion of the mitigation measures proposed. As described in Section 4.7, severe to moderate noise impacts due to the project will be mitigated.

Your preference for an at grade design is noted.

C-024-013

The potential for air quality and greenhouse gas emission impacts was examined by modeling the emissions at several of the more congested and high volume locations along the corridor, including near stations, as discussed in Section 4.6.3. Sound Transit found no violations of federal air quality standards in these locations. Design for the station and parking facility will be based on Sound Transit Design Standards and local agency input and review, as well as by WSDOT and

FHWA. Direct access to an interstate from a park and ride structure is not being considered because new access points to I-5 are not allowed by FHWA, but modified ramp access is being considered for several alternatives that would provide effective connections to the freeway. Access plans and designs for the station will address all modes, including the provision of bicycle facilities and storage.

C-024-014

Foliage, if dense, can provide slight reductions in noise levels. There is up to a 3-dBA reduction in transportation noise for locations with at least 100 feet of dense foliage that contains leaves all year. Also, a 3-dB reduction in noise level is barely perceptible to most people; therefore, foliage in virtually all areas of this project corridor will have little overall effect on light rail or traffic noise. On the subject of replanting removed foliage, please see the response to C-024-12.

C-024-015

Managing stormwater volumes and pollutant discharges to natural water bodies is a priority for Sound Transit. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources (including water resources) to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects. The project would be designed to comply with all federal, state, and local regulations to remove pollutants and control potential risks to water resources through project planning, design, and the application of best management practices.

C-024-016

Sound Transit requires all projects to consider low-impact development (LID) methods, such as permeable pavement, as a first choice for

stormwater treatment (Design Criteria Manual, July 2012). As summarized in Section 4.9.1 of the Draft EIS, the most common soil group in the project area is Type C, which is predominantly till-type soil that has a low infiltration and high runoff potential, generally not compatible with many LID approaches such as permeable pavement that require soil to infiltrate. However, some other locations in the project area contain Soil Types A and B, which have high to moderate infiltration potential, respectively, and are generally compatible with many types of LID stormwater facilities. Sound Transit will evaluate the feasibility of permeable pavement throughout the project area.

C-024-017

As described in Section 4.15.2 of the Draft EIS, power connections for the traction power substations to the nearest existing power source would be either overhead or underground. Section 4.15.3 of the Draft EIS describes existing utilities that may be relocated where they intersect the alternative alignments. The method of relocation would be consistent with Sound Transit's policy of replacing existing utilities in-kind when the relocation is to be funded by Sound Transit. The potential for using solar energy or other renewable energy sources is consistent with Sound Transit's Sustainability Policy, and would be reviewed during final design.

C-024-018

A geotechnical evaluation of the potential impacts of this project on Ridgecrest Park was completed as a component of design development. At both Twin Ponds Park and Ronald Bog Park, the preferred alignment is located on the east side of the freeway. Due to the distance of the project from the park, the vibrations during construction and operation of light rail are unlikely to affect the soils below the parks. Vibration monitoring equipment will also be routinely deployed along the alignment during construction to assess vibrations. If potentially damaging vibrations associated with construction activities are recorded, mitigation

measures (such as different types of equipment, protection at receptor locations, etc.) would be implemented.

C-024-019

Thank you for sharing your concerns regarding Ridgecrest Park. Sound Transit is working closely with the City of Shoreline to minimize impacts to Ridgecrest Park and mitigate unavoidable impacts. Based on preliminary design, a portion of the existing berm and trees will likely need to be removed. Sound Transit will coordinate with the City to replace the screening and noise reducing function of the berm and trees where possible. No impacts to the playing fields are anticipated.

C-025-001

I write regarding the fate of the Latvian Lutheran Church and Cultural Center at 11710 3d Ave. NE under plans to extend Light Rail northward in Seattle. It will be a tragedy if this ethnic and community resource were to be demolished.

On the heels of WWII, many thousands of Latvians found refuge in the United States from the Soviet occupation of their small Eastern European country. Many of them settled in large urban areas, including Seattle. While becoming responsible and productive citizens in their new land, they nevertheless managed to retain their language and many aspects of their culture heritage. They created self-help organizations, started Latvian language schools for their children, organized cultural events, and built their own churches, largely with volunteer labor. Their children's children still benefit from their labors and carry on the tradition.

Latvian church buildings serve not only their congregations' spiritual needs, they function as community centers for broader audiences, venues for cultural and sports events. Over the generations many smaller Latvian communities in the United States have disappeared or have greatly diminished their activities. Not so Seattle; it is one of the most active Latvia-American communities on the North American continent. In addition, its facility on 3rd Avenue is used by many other organizations.

I urge you to avoid demolishing this both symbolic and real example of successful American multiculturalism at work. If the building can be saved, then all steps should be taken to maintain access to the site during construction to prevent interruption of its community services.

Sincerely,

Lilita Bergs
Director, The Latvian Museum
The American Latvian Association in the United States, Inc.
400 Hurley Avenue, Rockville, MD 20850

C-025-001

The Sound Transit Board directed Sound Transit to explore a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained, although a small portion of land on the property's edge would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes including: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

To Whom It May Concern,

I am writing to you on behalf of the American Latvian Youth Association ("ALJA"). Our mission, since our founding in 1952, has been the furtherance of Latvian culture, language, and knowledge among Latvian youth across all of the United States. Over the past 61 years, we have had thousands of members throughout the country, and we are currently as active as ever in our history. While most of our membership resides in the Midwest, a core component of our ability to succeed in our mission is broad support from all of the Latvian community centers in the country. Since 1971, we have frequently used the Seattle Latvian Center for meetings and events. In addition, on several occasions, we have held our biggest annual event, Congress, in Seattle. From our perspective, The Latvian-American "experience" in Seattle is not rooted in Pike Place Market or the Space Needle. It is the Seattle Latvian Center, nestled amongst towering evergreens on the north Side of town, that for generations has served and nurtured our tight-knit community. While it may seem like another just another social hall or private structure standing in the way of a public works project, to us the Seattle Latvian Center truly *IS* Seattle. Countless weddings, confirmations, Youth Congresses, and other special events within the Latvian community have happened there. The Seattle Latvian Center is the largest and most vibrant in the Pacific Northwest, and I personally consider it the most uniquely beautiful Latvian community center in the United States. It is not just a simple social hall, but also a church and Latvian language school for our children. It was built from the ground-up by our fathers and grandfathers and to us, its importance goes beyond the bricks and mortar of the building itself.

This is especially true to our aging community members throughout America. To them their local Latvian community center is home. The Seattle Latvian Center is no different. Having lived through the horrors of World War II and the Soviet Occupation, our elderly population would definitely be the most affected by the loss or relocation of the Latvian Center. It will be recalled that the Soviet Union used eminent domain to make public their homes and possessions. To allow that to happen again, albeit with completely different motives, would no doubt be seen a slap in the face to the elderly Latvian population in Seattle. Our cultural centers embody the decades of work, decades of struggle, and decades of pride within our ethnic community. In Seattle, the Latvian community is vibrant and alive largely as a result of having such a fine facility. For many in Seattle, the Latvian center represents their unique struggle and shows that with grit and perseverance they were able to build a community thousands of miles away from home. The term "negative impact" does not even begin to describe the toll that this project would take on the local Latvian community. The impact on our organization would be the loss of a facility that is integral to the furtherance of our mission.

C-026-001

Accordingly, we request that Sound Transit review each of the alternative routes in the DEIS, and select the one that has the least impact on the activities of the Seattle Latvian Center. To the extent there is an option that allows the Latvian Center to remain in its current location, we respectfully request that such alternative be reviewed and selected, and that any impacts be fully mitigated. The relocation of such a culturally significant facility would have substantial impact on ALJA and would be devastating to the local community in Seattle.

C-026-001

The Sound Transit Board directed Sound Transit to explore a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook so that none of the Segment A alternatives in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained, although a small portion of land on the property's edge would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a small portion of the church property.

Several sections in the Final EIS have been updated to address these changes including: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

C-026-001 While we understand the need and demand for public transit expansion in the city, our organization, ALJA, on behalf of our members nationwide, urge Sound Transit and the City of Seattle to re-route the proposed railroad to save our largest cultural, educational, and social hub in the Pacific Northwest.

Respectfully yours,

Karlis Lenss

Joni Earl, CEO
c/o Lauren Swift
Sound Transit
401 S. Jackson Street
Seattle, WA 98104

RE: Sound Transit DEIS for the Lynnwood Link Extension

Dear Joni Earl,

On behalf of Cascade Bicycle Club (Cascade) and our more than 15,000 members, as well as our roughly 25,000 activists in the affected cities, I provide the following comments regarding the Draft Environmental Impact Statement for the Lynnwood Link Extension.

The region shares a objectives to reduce global warming pollution and vehicle miles traveled,[1] create economically thriving regional growth centers, increase affordability in considering both housing and transportation costs, and improve the livability of our communities. These objectives are repeated throughout state, regional and local laws and policies, from the state Growth Management Act and climate goal to VISION 2040 and Transportation 2040 to county and city climate action strategies and comprehensive plans.

Following the adoption of VISION 2040, the region's voters approved a key tool for fulfilling these objectives: expanding Sound Transit's light rail service to Lynnwood, Overlake, and Federal Way. As Sound Transit now expands light rail to its authorized extent, the key question facing the agency is how can its investment be best leveraged to achieve the region's shared objectives.

C-027-001

In this regard, Cascade makes several comments and recommendations. Our top two priority recommendations are:

1. Evaluate all potential new bicycle infrastructure within a three-mile radius of the proposed light rail stations, consistent with Federal Transit Administration rules and guidelines.
2. Compare the cost-effectiveness of all station-access investments in their ability to achieve transit ridership and the region's goals and objectives for creating "compact urban communities."

[1] RCW 70.235.020; RCW 47.01.440.

7300 Sand Point Way NE, Suite 101S • Seattle WA 98115-8110 • phone: (206) 522-3222 • fax: (206) 522-2807 • www.cascade.org • info@cascadebicycleclub.org

C-027-001

As described in Section 1.4 of the Final EIS, the light rail alternatives, including potential stations, are in response to the project's purpose and need, as defined in Chapter 1. While bicycle access remains an important consideration for the project, further study and detailed evaluations of bicycle access would not substantially differentiate the alternatives under consideration. All of the alternatives are designed to provide for effective pedestrian and bicycle access, including to and from the stations to feeder bus lines/stations, park-and-ride facilities, and to the surrounding street system. The project would be designed to satisfy all applicable public access, facility design standards, and life safety requirements. As described in Section 3.2.5 of the Final EIS, Sound Transit would provide for pedestrian and bicycle access at Lynnwood Link Extension stations and on streets reconstructed as part of the project, consistent with the agency's adopted System Access Policy. Finally, the Federal Transit Administration's rules and guidelines for a New Start project EIS do not dictate a 3-mile radius study area for bicycle facility inventories, but the project's EIS did include an inventory of facilities within 1 mile of potential stations.

bicycle club Cascade

Creating a better Community Through Bicycling

C-027-002

Station Location Selection

These region's objectives are to reduce greenhouse gas emissions and vehicle miles traveled and to encourage compact urban development in regional growth centers and along high-capacity transit. VISION 2040 states:

> Compact urban communities offer transportation, housing, and shopping choices that reduce the need for automobile travel and allow residents to walk or bicycle to neighborhood stores. Streets are laid out in a grid pattern or are interconnected, rather than as cul-de-sacs, to support efficient transit operations, as well as walking and bicycling. Typically there are a variety of housing types, such as single-family homes on smaller lots and small apartment buildings. Often small neighborhood activity hubs serve as centers for shopping and local services.
>
> Compact development can be more efficient and cost-effective to serve with infrastructure and services. By creating an environment that is more conducive to walking, bicycling, and using transit, compact development can also contribute to reducing greenhouse gases and other pollutants.
>
> Many of the region's transportation thoroughfares are lined with single-story, single-use developments. These areas present opportunities for redevelopment and infill. Along major transit routes, redevelopment can occur in the form of transit-oriented development, where mixed-use projects that provide housing, employment, and retail can focus around a transit station or hub and serve as an activity node for adjacent neighborhoods.
>
> VISION 2040 supports compact urban communities and promotes the development of vacant or underutilized urban land in a manner that supports transit, conserves resources, and builds communities. VISION 2040 also supports redevelopment of selected low-density commercial corridors to make them more transit-oriented and pedestrian-friendly.[2]

As Sound Transit chooses station locations, the agency should make sure its selection matches the region's vision for compact communities.

Cascade strongly supports locating stations as far from Interstate 5 as possible. Interstates divide communities and significantly reduce the potential for transit-oriented development and the creation of a cohesive compact urban community. Interstates are also detrimental air quality, so building the central node farther away from the interstate can help reduce the potential number of people affected. Of the potential Lynnwood station locations, option C1 is the farthest from I-5 and the most centrally located toward likely transit-oriented development in the future. In addition, pedestrians and bicyclists may find navigating to get to the C2 and C3 locations difficult due to distance, signage, and unattractiveness. Likewise, Cascade strongly supports the Mountlake Terrace Transit Station instead of the freeway median station because the station would be nearer to redevelopment opportunities in Mountlake Terrace.

[2] VISION 2040, p. 52.

1400 Eastlake Point Way NE, Suite 101S • Seattle WA 98115-8170 • phone: (206) 522-3222 • fax: (206) 522-2807 • www.cascade.org • info@cascadebicycleclub.org

C-027-002

Alternative routes away from the I-5 corridor were considered during the Alternatives Analysis and early EIS planning, with participation from the public and jurisdictions. This included alignments along Lake City Way, 15th Avenue NE, and SR 99. Ultimately, the current station sites are in locations that still provide good multimodal access to nearby centers, but avoid higher impacts to the surrounding neighborhoods and the natural environment. Section 2.5, Descriptions of Light Rail Alternatives by Segment, gives further details on the planning, environmental, transportation, engineering and cost considerations that shaped the EIS alternatives, and the project's Alternative Analysis report is appended to the EIS. In Segment B, the Preferred Alternative has the station at the transit center, nearer the areas Mountlake Terrace targets for transit-oriented development. In Segment C, while Alternative C1 has the station closest to the city center, the connecting alignment also carried the highest level residential and displacement impacts, and impacted a city park. The Preferred Alternative, a modified C3, brings the station closer than the original Alternative C3 while still retaining that alternative's lower overall environmental impacts. The station area design also offers good visibility and allows effective bicycle and pedestrian connections from multiple directions.

bicycle club Cascade

Creating a better Community Through Bicycling

C-027-003 **Cascade encourages Sound Transit to select stations that are already near existing business areas.** The improvement of existing urban activity centers is an easier task than the creating whole new urban centers. The evaluation of the 130th, 145th, and 155th stations would be well-informed by this perspective.

C-027-004 **In selecting station locations, Cascade requests Sound Transit to evaluate how potential investments in pedestrian and bicycle infrastructure and transit circulator service could impact transit ridership and transit-oriented development.** For example, the NE 145th Station may score better with pedestrian and bicycle connections to the business district on 15th Avenue, and the NE 155th Station may score better with transit circulator service and protected bike lane to the Shoreline Community College and Shorecrest High School.

C-027-005 **Cascade supports the addition of more stations, including two or three stations in segment A and two stations in segment B.** More stations mean that more people will not have to go as far to access light rail, thereby favoring walking and bicycling as modes of access to the light rail system instead of automobile driving. Stations at NE 130th Street, NE 155th Street, and 220th Street SW, in combination with the NE 185th Street and Mountlake Terrace Transit Center stations, would best support a balanced access to the transit system that would support placemaking and access via bicycling and walking.

Purpose & Needs Statement

C-027-006 Transit is not an end in itself, it is a tool toward achieving a set of goals and objectives. Unfortunately, the DEIS's "purpose and needs statement" confuses the purpose and need of transit by making highlighting the first purpose in itself. It's a circular argument: we must build transit because we must build transit.

The region's transportation and land use goals and objectives are set out in VISION 2040 and Transportation, as quoted above. The extension of light rail is a tool to achieve those goals and objectives. As such, **Cascade urges Sound Transit to add the following statements to the beginning of the the DEIS purpose and needs statements.**

- New Purpose Statement, to lead the other purpose statements:
  "Catalyze the development of compact urban communities consistent with VISION 2040 that improves household affordability of transportation and housing costs, reduces greenhouse gas emissions and vehicle miles traveled, and fosters transit-oriented development."
- New Needs Statement, to lead the other needs statements:
  "Address the need to accommodate the region's population growth in compact urban communities consistent with VISION 2040 in order to improve household affordability combined transportation and housing costs, reduce greenhouse gas emissions and vehicle miles traveled, and foster economic development."

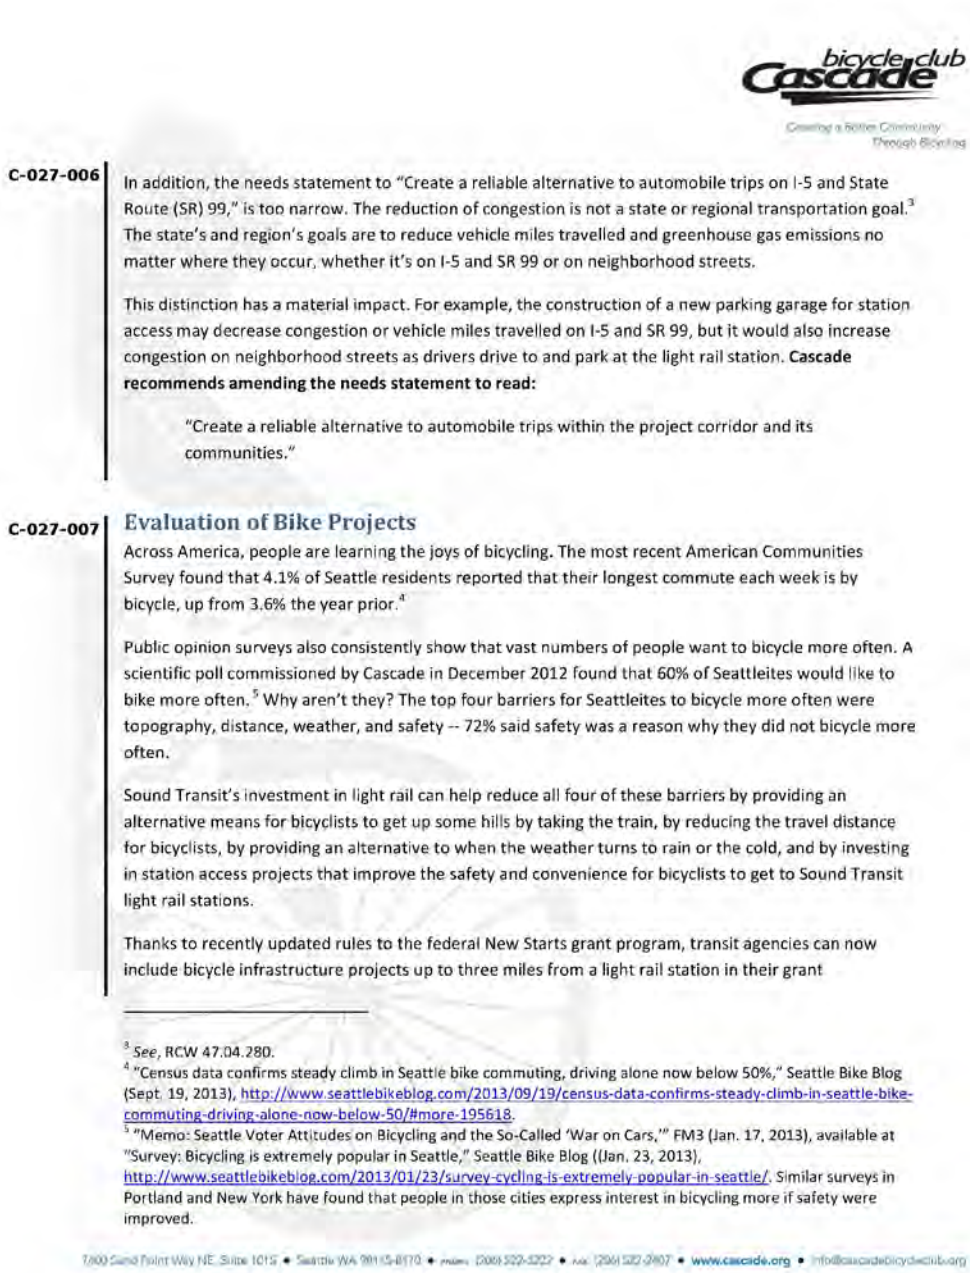
7500 Sand Point Way NE, Suite 1013 • Seattle WA 98115-8170 • phone: (206) 522-3222 • fax: (206) 522-2907 • www.cascade.org • info@cascadebicycleclub.org

C-027-003

Section 2.5.1 describes the factors Sound Transit considered in developing its alignment and station alternatives, which in this corridor needed to balance transportation, access, land use, economic development, environmental and cost factors. As noted in the station by station qualitative ratings of station area transit oriented development, including for potential stations at NE 130th Street, NE 145th Street, and NE 155th Street, there are few business districts near the general alignment along I-5, outside of the two regional centers at Northgate and Lynnwood. Other alignments farther from the freeway would carry much higher environmental impacts and would carry longer travel times. Chapter 4, Section 4.2.4 summarizes the station area development potential by station area.

C-027-004

In the Draft EIS Chapter 5, Evaluation of Alternatives, Transit Oriented Development ratings were provided (see Tables 5-2, 5-3 and 5-4), based on a range of factors including multimodal access, as well as land use and development conditions. During the Alternatives Analysis and continuing into the EIS alternatives assessment, general station sites were identified for the project, bicycle and pedestrian qualitative measures were also considered (see the Alternative Analysis Report, Chapter 5, and Chapter 2 of the EIS). These measures, along with the other measures of potential mobility, ridership, and land use benefits, transportation impacts, environmental impacts, and constructability, have helped determine the range of station sites and the general features and access plans for the EIS analysis. Transit ridership estimates are primarily driven by population, employment, regional characteristics such as transportation conditions between origins and destinations (including highway conditions), and general accessibility to the station, rather by access by mode. During final design, consistent with the agency's System Access Policy, Sound Transit will continue to collaborate with the local jurisdictions on opportunities to improve bicycle and pedestrian



bicycle club Cascade

Creating a Better Community Through Bicycling

C-027-006

In addition, the needs statement to "Create a reliable alternative to automobile trips on I-5 and State Route (SR) 99," is too narrow. The reduction of congestion is not a state or regional transportation goal.[3] The state's and region's goals are to reduce vehicle miles travelled and greenhouse gas emissions no matter where they occur, whether it's on I-5 and SR 99 or on neighborhood streets.

This distinction has a material impact. For example, the construction of a new parking garage for station access may decrease congestion or vehicle miles travelled on I-5 and SR 99, but it would also increase congestion on neighborhood streets as drivers drive to and park at the light rail station. **Cascade recommends amending the needs statement to read:**

> "Create a reliable alternative to automobile trips within the project corridor and its communities."

C-027-007

Evaluation of Bike Projects

Across America, people are learning the joys of bicycling. The most recent American Communities Survey found that 4.1% of Seattle residents reported that their longest commute each week is by bicycle, up from 3.6% the year prior.[4]

Public opinion surveys also consistently show that vast numbers of people want to bicycle more often. A scientific poll commissioned by Cascade in December 2012 found that 60% of Seattleites would like to bike more often.[5] Why aren't they? The top four barriers for Seattleites to bicycle more often were topography, distance, weather, and safety -- 72% said safety was a reason why they did not bicycle more often.

Sound Transit's investment in light rail can help reduce all four of these barriers by providing an alternative means for bicyclists to get up some hills by taking the train, by reducing the travel distance for bicyclists, by providing an alternative to when the weather turns to rain or the cold, and by investing in station access projects that improve the safety and convenience for bicyclists to get to Sound Transit light rail stations.

Thanks to recently updated rules to the federal New Starts grant program, transit agencies can now include bicycle infrastructure projects up to three miles from a light rail station in their grant

[3] *See*, RCW 47.04.280.

[5] "Memo: Seattle Voter Attitudes on Bicycling and the So-Called 'War on Cars,'" FM3 (Jan. 17, 2013), available at "Survey: Bicycling is extremely popular in Seattle," Seattle Bike Blog ((Jan. 23, 2013), http://www.seattlebikeblog.com/2013/01/23/survey-cycling-is-extremely-popular-in-seattle/. Similar surveys in Portland and New York have found that people in those cities express interest in bicycling more if safety were improved.

7400 Sand Point Way NE, Suite 101S • Seattle WA 98115-8170 • phone: (206) 522-3222 • fax: (206) 522-2807 • www.cascade.org • info@cascadebicycleclub.org

networks serving the station, as an element of a balanced multimodal access plan that would effectively serve the transit riders expected at the station.

C-027-005

Your preference for more stations, including stations at NE 130th Street, NE 155th Street, NE 185th Street, and 220th Street is noted. The Preferred Alternative has options for additional stations at NE 130th Street and 220th Street.

C-027-006

Comment noted. The need for the project, as described in Section 1.2.2 of the Draft EIS, includes language on regional mobility and a decrease in transportation-related energy consumption and GHG emissions. The Purpose and Need also refers to environment and supporting regions' adopted land use plans.

C-027-007

The increased use of bicycling is very consistent with trends showing greater use of transit and walking, and slower growth in vehicle use. The light rail project is part of an integrated solution encouraging other alternative modes, including bicycling, in the corridor and the region. In the EIS assessment of impacts, Sound Transit inventoried bicycle facilities within a 1-mile radius of potential stations, and considered potential conflicts as well as access needs, as described in Chapter 3, Sections 3.1.5 and 3.2.5 of the Draft EIS. The Final EIS has updated information. While bicycle and trail improvements within a 3-mile radius of transit stations can be grant-eligible under New Starts, they do not impose a minimum study area or a required set of non-motorized access improvements for New Start projects. As noted in the responses above, Sound Transit will continue to work on access planning with local jurisdictions during final design. This effort could include developing

bicycle club Cascade

Creating a better Community Through Bicycling

C-027-007 applications without justifying the expense with a ridership study and without the additional cost weighing against the grant application's cost-effectiveness.[6]

In other words, transit agencies can now build any bicycle infrastructure project within a three mile radius and the only constraint in the Federal Transit Administration (FTA)'s evaluation process is the total available funds. In addition, bicycle infrastructure projects outside the three mile radius are also eligible for New Starts funding, but require justification based on ridership and would count against the cost-effectiveness of grant application.

Using a three-mile radius to evaluate and invest in bicycle infrastructure makes sense. For example, access to potentially big trip generators could be evaluated, such as protected bike lanes from the NE 155th Street Station to Shoreline Community College and Shorecrest High School, and from the 220th Street SW Station to Edmonds Community College. In addition, such a larger analysis would provide a more regional focus toward improving nonmotorized transportation options and access to light rail in Lake Forest Park, Edmonds, and Mukilteo.

Unfortunately, in discussing the mitigation to potential impacts on bicycle facilities (3.2.5), the Draft Environmental Impact Statement fails to commit Sound Transit to evaluating new bicycle infrastructure within a three-mile radius.

Given that all bicycle projects within a three-mile radius can be funded by New Starts without negatively affecting a grant application, **Cascade urges Sound Transit to go beyond its stated one-mile radius and evaluate all projects within a three-mile radius of each proposed station.**

C-027-008 Beyond the planning documents identified on page 3-38, planned bicycle infrastructure is identified in, or supported by, the 2013 update to the Seattle Bicycle Master Plan; all cities' capital improvement plans; cities' "complete streets" and "safe routes to school" policies; the Mukilteo Pedestrian, Bicycle, and Trails Plan; and the Lynnwood Transportation and Bicycle Plan. All bicycle infrastructure identified within these plans, and within a three-mile radius of any light rail station, should be evaluated by Sound Transit for investment.

Best practices for bikeways designs are constantly evolving. In order to make sure infrastructure is as safe as possible, as well as regionally consistent, we encourage Sound Transit to use the "Urban Bikeway Design Guide," produced by the National Association of City Transportation Officials (NACTO).[7] The Federal Highway Administration recently adopted the NACTO guide as its baseline for bikeway design.[8]

In addition, Cascade finds that Sound Transit excessively restricts the evaluation and construction of bike infrastructure. The DEIS states that both mitigation and planned bike infrastructure would only be

[6] "New and Small Starts Evaluation and Rating Process – Final Policy Guidance," Federal Transit Administration (Aug. 2013), available at http://www.fta.dot.gov/documents/NS-SS_Final_PolicyGuidance_August_2013.pdf.
[7] http://nacto.org/cities-for-cycling/design-guide/.
[8] http://nacto.org/2013/09/13/city-transportation-officials-praise-federal-highway-guidance-on-bicycle-design/

7400 Sand Point Way NE, Suite 101S • Seattle WA 98115-8170 • phone (206) 522-3222 • fax (206) 522-2807 • www.cascade.org • info@cascadebicycleclub.org

strategies to assist the local agencies in identifying and prioritizing improvements, establishing partnerships, and seeking funding including other grants for supporting improvements.

C-027-008

Project designers will use the Urban Bikeway Design Guide by the National Association of City Transportation Officials, in conjunction with Sound Transit design standards and applicable WSDOT and local jurisdictional design standards. Please also see the response to C-027-007. The statements in the Draft EIS (page 3-38 and 3-39) relate to how Sound Transit would provide for pedestrian and bicycle access on roadways reconstructed as part of the project. Although other roadways in the study area may be reconstructed by the cities over time, bringing those facilities up to current standards, Sound Transit's conclusions about bicycle and pedestrian access immediately around stations generally did not assume such improvements.

bicycle club Cascade

Creating a Better Community Through Bicycling

C-027-008 "implemented with reconstructed roadways." Roadway reconstruction is too infrequent to make this a meaningful approach toward increasing the safety and convenience of accessing light rail stations. This is wholly inadequate. Investments in bicycle infrastructure need to be made proactively to encourage access, not wait forty years until a street is reconstructed.

C-027-009 **Encourage Non-Motorized Station Access**

The construction of parking lots or garages should not be considered a given. Sufficient parking already exists in many of the station-areas, the DEIS fails to fully analyze the potential environmental impact of the parking garages, parking garages are an expensive means to achieve ridership, and any investment in car parking spaces should be evaluated in comparison to other station-area access investments. To the extent that additional parking is deemed to be necessary, the surface lot or structure should be designed to allow future repurposing for transit-oriented development.

Cascade recommends better utilizing the existing available parking instead of building parking lots or garages. The DEIS itself found sufficient parking in most of the station areas, calling into question whether additional parking lots or structures are necessary. According to Table 3-5, there are a total of 6,130 unused parking spots available within a quarter-mile of the stations.[9] In fact, only 15.6% of available on-street parking is utilized and 57.7% of off-street parking is utilized. Parking management strategies that utilizes the existing available parking would be a more cost-effective strategy for providing parking access while achieving regional goals for creating compact urban communities that rely more on bicycling and transit.

C-027-010 **Cascade recommends analyzing the vehicle miles travelled and greenhouse gas emissions induced by building a parking garage.** By building a parking garage as a means for drivers to access the light rail station, Sound Transit will be inducing people to drive to the station. Embedded in that inducement are greater greenhouse gas emissions and vehicle miles traveled. Sound Transit needs to calculate this environmental impact.

C-027-011 **Cascade recommends evaluating the cost of building a parking garage based on the marginal cost per stall and rider.** At $30,000 to $40,000 per stall within a parking structure, a stall in a parking garage is significantly more expensive than on a surface lot. However, in reality the cost is much more than even the $30,000 to $40,000 per stall. A stall in parking lot (without a structure) costs about $4,000. Thus, if Sound Transit decides to build 350 stalls in a parking structure instead of 100 stalls in a parking lot (a price difference of $14 million versus $400,000, assuming per-stall costs of $40,000 and $4,000, respectively), the marginal cost of the additional 250 stalls is actually $54,400 – or 36% greater. In evaluating the cost-effectiveness of a parking structure to increase transit ridership and achieve the

[9] The Mountlake Terrace Freeway Station, Lynnwood Park & Ride, and Lynnwood Transit Center stations not included in the calculation in order to prevent any double counting.

7400 Sand Point Way NE, Suite 101S • Seattle WA 98115-8170 • phone (206) 522-3222 • fax (206) 522-2807 • www.cascade.org • info@cascadebicycleclub.org

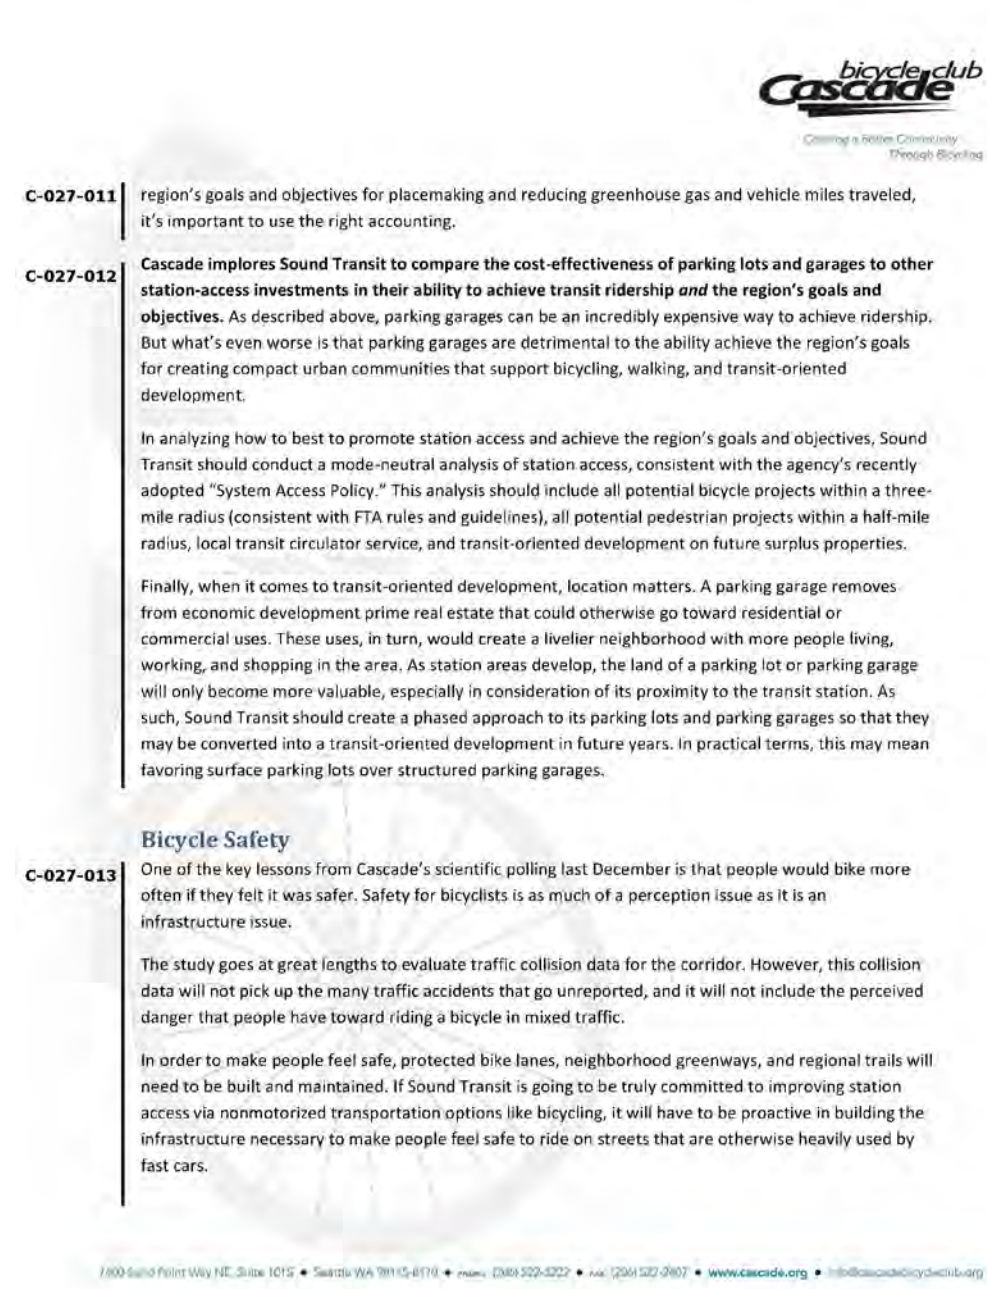
C-027-009

Park-and-ride spaces minimize parking impacts to neighborhoods and provide access to light rail for areas transitioning from suburban to urban densities. As described in Section 3.2.7 of the Draft EIS, park-and-ride lots are generally sized to accommodate future parking demand, and the amount of parking at each station may be further refined in future phases of the project.

As described in Section 4.2.4 of the Draft EIS, analysis of alternatives included assessments for all proposed station locations based on existing conditions that support transit-oriented development, transit-supportive plans and policies, station access, and potential development opportunities. In addition, Sound Transit's TOD policy includes goals that encourage safe multi-modal access to the transit system, with an emphasis on non-motorized access; and support economic development efforts. Implementation of TOD policy continues through final design, construction, and post construction. Implementation includes identifying TOD opportunities and strategies as well as partnerships with public and private interests.

C-027-010

Vehicles traveling to and from parking garages were included in the traffic analysis and are reflected in the vehicle miles traveled and greenhouse gas emissions projections, the "hot spot" air quality analysis, and as part of the other evaluations of impacts for each of the project alternatives. This responds to the need for the EIS to identify significant environmental impacts and appropriate mitigation for the alternatives considered. During final design, Sound Transit's System Access Policy will continue to be applied as Sound Transit further evaluates the multimodal access needs of the project, working collaboratively with the communities to be served.



bicycle club Cascade

Creating a better Community Through Bicycling

C-027-011 region's goals and objectives for placemaking and reducing greenhouse gas and vehicle miles traveled, it's important to use the right accounting.

C-027-012 **Cascade implores Sound Transit to compare the cost-effectiveness of parking lots and garages to other station-access investments in their ability to achieve transit ridership *and* the region's goals and objectives.** As described above, parking garages can be an incredibly expensive way to achieve ridership. But what's even worse is that parking garages are detrimental to the ability achieve the region's goals for creating compact urban communities that support bicycling, walking, and transit-oriented development.

In analyzing how to best to promote station access and achieve the region's goals and objectives, Sound Transit should conduct a mode-neutral analysis of station access, consistent with the agency's recently adopted "System Access Policy." This analysis should include all potential bicycle projects within a three-mile radius (consistent with FTA rules and guidelines), all potential pedestrian projects within a half-mile radius, local transit circulator service, and transit-oriented development on future surplus properties.

Finally, when it comes to transit-oriented development, location matters. A parking garage removes from economic development prime real estate that could otherwise go toward residential or commercial uses. These uses, in turn, would create a livelier neighborhood with more people living, working, and shopping in the area. As station areas develop, the land of a parking lot or parking garage will only become more valuable, especially in consideration of its proximity to the transit station. As such, Sound Transit should create a phased approach to its parking lots and parking garages so that they may be converted into a transit-oriented development in future years. In practical terms, this may mean favoring surface parking lots over structured parking garages.

Bicycle Safety

C-027-013 One of the key lessons from Cascade's scientific polling last December is that people would bike more often if they felt it was safer. Safety for bicyclists is as much of a perception issue as it is an infrastructure issue.

The study goes at great lengths to evaluate traffic collision data for the corridor. However, this collision data will not pick up the many traffic accidents that go unreported, and it will not include the perceived danger that people have toward riding a bicycle in mixed traffic.

In order to make people feel safe, protected bike lanes, neighborhood greenways, and regional trails will need to be built and maintained. If Sound Transit is going to be truly committed to improving station access via nonmotorized transportation options like bicycling, it will have to be proactive in building the infrastructure necessary to make people feel safe to ride on streets that are otherwise heavily used by fast cars.

7400 Sand Point Way NE, Suite 101 • Seattle WA 98115-8170 • phone (206) 522-3222 • fax (206) 522-2807 • www.cascade.org • info@cascadebicycleclub.org

C-027-011

As part of final design for the project, Sound Transit will continue to examine options to increase the cost-effectiveness of the project. The alternatives involving parking garages rather than expanded surface parking reflect the limited availability of right-of-way along the corridor, much of which is already developed, although in some station sites there are options for surface parking. Overall, the EIS's range of alternatives, including the station locations and the parking capacity assumed, are in response to projected demand. Parking is one element of a balanced approach for a regional system that provides access via a variety of modes. The current demand for parking at all transit centers and major park & ride lots along this extension is greater than supply, with most lots full by 8 am or earlier on weekdays. It is reasonable to expect that as population and employment grows in the corridor, growth in transit center parking will also continue, as would growth in the use of other modes of access.

C-027-012

Sound Transit does not consider parking investments to be in competition with other access components of the project, nor does it consider parking to be inconsistent with local and regional goals for creating compact and walkable communities. Provisions for parking are part of a balanced approach to developing effective multimodal access to the regional system. The alternatives considered in the EIS, including provisions for parking garages, represents a long history of alternatives planning that is detailed in Chapter 2, and which includes the results of many rounds of public participation and comment. Additional parking as part of the project reflects the project description included in the ST2 Plan, funding for which was approved by voters in 2008, and which itself involved extensive public planning. The multimodal access reflects Sound Transit's adopted Systems Access Policy, which recognizes that people may choose among a variety of modes as they access a station, depending on their own needs and circumstances. As noted in

responses above, Sound Transit will continue to develop the more detailed station access plans for the adopted project during final design, and cost-effectiveness of a variety of project elements and design approaches will continue to be considered.

C-027-013

Sound Transit remains committed to developing effective multimodal access to its stations, but the project's purpose is focused on transit improvements rather than repairing existing deficiencies in the road, bike, and pedestrian network. The review of collision data was primarily intended to assist in evaluating whether the project would aggravate existing safety concerns or create new safety conflicts for bicyclists. Sound Transit is also committed to working with its partners to advance opportunities to increase the use of bicycles and other alternative modes that would connect the stations to the surrounding communities.

RE: Lynnwood Link Extension Draft Environmental Impact Statement

Dear Ms. Swift:

Since 2001, Feet First has worked to ensure that all communities in Washington are walkable. We represent people of all ages looking for safe, accessible, and inviting ways to go by foot. Walking is a vital transportation mode that strengthens communities, reduces pollution, and promotes good health.

Feet First strongly supports the development of vibrant, walkable communities throughout the region. If done right, the construction of Sound Transit's link light rail system presents a great opportunity to foster the development of such communities. Station placement is arguably the most critical factor in creating walkable transit-oriented communities near stations. Consequently, we are following with great interest the environmental review for the Lynnwood link extension for light rail between Northgate and Lynnwood. Below are our comments on the recently-released draft environmental statement (DEIS).

C-028-001

The DEIS analysis of long-term TOD potential at each potential station seems to be largely based on existing local and regional land use plans. While this is a prudent approach, it's very possible that the area surrounding identified station sites will be subsequently upzoned to accommodate more development. The land use analysis should include potential additional development beyond that allowed in adopted plans, perhaps as a separate scenario in addition to the current plan scenario presented in the DEIS.

C-028-002

As a general rule, Feet First encourages locating stations away from the immediate vicinity of the I-5 freeway corridor. Locating stations right next to freeways decreases the amount of adjacent land available for transit-oriented development (TOD) and also reduces the size of the fifteen-minute walkshed surrounding the station.

C-028-003

Feet First supports the addition of an additional light rail station at NE 130th Street. This station would place an additional 5700 people within a fifteen-

C-028-001

The Draft EIS long term (direct) impacts assessment considered existing land use plans as well as plans in progress, focusing on consistency with existing or officially proposed local government land use plans and policies. Please see Section 4.2.4 Indirect and Secondary Impacts for potential impacts associated with possible changes in zoning by the local jurisdictions, which in some cases would be needed to allow higher density and mixed-use land uses in station areas.

C-028-002

As described in Section 2.5 of the Draft EIS (*Chapter 2 Alternatives Considered*), prior to the Draft EIS and Final EIS, Sound Transit evaluated a variety of options for this project based on a number of criteria. Future development potential was one of the criteria assessed during the Alternatives Analysis. The Sound Transit Board chose an I-5 alignment. Sound Transit continues to work with jurisdictions on planning for the areas around the stations to ensure multi-modal access is achieved.

C-028-003

Thank you for identifying the advantages Feet First sees in a NE 130th Street Station. The Sound Transit Board identified an at-grade and elevated alignment with stations at NE 145th and NE 185th streets (Alternative A1 with modifications) as the Preferred Alternative, and also directed further study of options to add a station at NE 130th Street or to make provisions for a future station. A station at NE 155th Street was not identified for the Preferred Alternative, but is still evaluated in the Final EIS under Alternatives A5 and A7. The Preferred Alternative also includes a station at the Mountlake Terrace Transit Station in Segment B. The Segment C Preferred Alternative is a modified Alternative C3 that places that station closer to the urban center and away from I-5, and includes improved walk access.

C-028-003

minute walk of the station and increase system-wide daily boardings of 400 riders under the current zoning. A station at NE 130th carries the additional advantage of opening the NE 125th/130th Street corridor to east-west feeder bus service. This will provide good bus access between the light rail system and the urban villages of Lake City and Bitter Lake.

We prefer a station at NE 155th Street instead of NE 145th Street. A NE 145th Street station has very limited potential for TOD, assuming that Jackson Park Golf Course and Lakeside School are off limits for development. NE 145th street is currently a terrible pedestrian street, with a large interchange, fast-moving traffic, wide intersections, and narrow sidewalks which will be difficult to widen. By contrast, NE 155th Street has a good, pedestrian-friendly, grid network of streets and more room for development.

Feet First strongly prefers the Montlake Terrace Transit Center over the Montlake Terrace Freeway Station. The Transit Center site puts the station within the Montlake Terrace Town Center. A station here will be much more accessible to pedestrians and a stronger TOD catalyst. The Freeway Station site puts the station about two minutes further away from the Town Center. Using the Transit Center site will increase system-wide transit ridership by 1000 riders per day.

Feet First prefers alternative C-1 (200th Street SW) for the Lynnwood station. This location is several blocks closer to the emerging Lynnwood urban village and is furthest away from I-5.

C-028-004

The current plan for the Lynnwood Link Extension includes thousands of new park & ride lots at most of the new light rail stations. Feet First believes that such a heavy reliance on structured parking is problematic. Structured parking attracts additional peak hour traffic to nearby arterials. Heavy traffic degrades pedestrian safety and discourages people from walking. Street intersections must be widened to accommodate additional turn lanes, thereby increasing pedestrian crossing distances. Traffic also brings increased noise and air pollution to the streetscape, creating a pedestrian-hostile environment. Structured parking also carries an opportunity cost in that land devoted to parking cannot be used for residential and retail development that contributes to the development of vibrant urban centers. Parking is also very expensive; the typical cost for structured parking is up to $30,000 to $40,000 per space. We feel very strongly that the final EIS should include a cost benefit analysis of structured parking along the Lynnwood Link Light Rail.

Thank you for considering our thoughts on the Lynnwood Link Extension DEIS. We look forward to working with Sound Transit in the coming months towards the development walkable transit-oriented communities. If you have any questions or concerns, please contact me by calling 206.652.2310 ext. 6 or emailing me at lisa@feetfirst.org.

Sincerely yours,

Lisa Quinn
Executive Director

C-028-004

As described in Section 2.3 of the Final EIS, the project is applying a balanced multimodal approach to plan for effective station access, consistent with Sound Transit's adopted System Access Policy. Parking along with other features of the stations would help serve a variety of user types including non-motorized users, those commuting by automobile, and those arriving on feeder bus lines. Park-and-ride spaces help minimize transit-related parking impacts to neighborhoods, and also provide access to light rail for areas transitioning from suburban to urban densities, as well as for areas that are more distant from the alignment or with less convenient connections via transit or other non-automobile modes. The use of parking garages, while more expensive than a surface lot, helps preserve the future potential for transit-supportive developments within the larger station area. Section 4.2.4 of the Draft EIS summarized an assessment of station locations based on conditions that could support transit-oriented development.

As described in Section 3.2.7 of the Draft EIS, park-and-ride lots are generally sized to accommodate predicted parking demand, although the amount of parking at each station may be further refined in future phases of the project.

FABS
Fellowship of American Baltic Spouses

A Washington State Organization Whose Members Have Spouses of Estonian, Latvian or Lithuanian Heritage

Richard C. Wiest

Sound Transit
Draft EIS Comments c/o Lauren Swift
401 S. Jackson St.,
Seattle, WA 98104

C-029-001

I write to add the voice of the organization which I chair to the chorus of concern (which I hope has turned into an avalanche) about the fate of Latvian Church & Community Center in the face of light rail expansion to Lynnwood. FABS has a few dozen core members, but our extended families and friends number much more. We exist to support the efforts our ethnic wives and husbands, and our often bilingual children and grandchildren, to celebrate and preserve their heritage. None of our group is of Baltic background but we have married into rich, vibrant and diverse cultures. All of us share in our own lives a deep experience of the uniqueness and worth of the traditions of the three countries.

We can approach the matter with a degree of an outsider's critical detachment and at the same time feel the insider's passion. One aspect, however, is crystal clear: the Latvian Community Center & Church is the node or nexus or focus, call it what you will, of the ability of all three cultures to continue to flourish in Washington State. It is the physical tie that both binds and allows for freedom. If the many threads of activity that run through the institution are seriously frayed or severed, the survival of the cultures and their wider beneficial effect in our state are threatened.

We support in principle the expansion of light rail but we urge you to recast your designs in order to leave the unique and irreplaceable Center and Church as unaffected as possible.

Yours very truly,

Richard C. Wiest
FABS Chair

C-029-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

LBVŠ **Latvian Association of the State of Washington**

P.O. Box 75081
Seattle, WA 98175-0081

Sound Transit
c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

C-030-001 We, the 300+ members of the Latvian Association of the State of Washington, are deeply concerned and bitterly disappointed about your proposed Light Rail plan. If the plan proceeds, it will drastically disrupt the well-being and perhaps even destroy the existence of the Latvian Lutheran Church and Cultural Center. Your planned construction of the Light Rail link between Northgate and Lynnwood does not seriously consider the social, cultural and physical impact on our old and well established multifunctional Center.

C-030-002 As you know, our first church and cultural center was taken for a park by the city of Seattle in 1969. Now it appears that we are facing possible condemnation and eviction for the second time in our 62-year history. In addition to our bitterness about the proposed plan, we most emphatically feel that virtually no consideration was given in your earlier planning to our facilities and the organizations which depend upon the Center. Although your current options do take minor note of our existence, those options are nonetheless inadequately thought through and need considerable further study. Issues of concern include, among others, track alignment, access, construction impact, noise abatement, geotechnical matters and the destruction of our caretaker's house.

In our opinion, Sound Transit has not fully examined nor addressed and given clear responses to our concerns. There also has been no meaningful rail alignment option given, such as relocation of the rail bed. There have been no solutions offered for the noise problems, vibration, lights and radio interference nor is there evidence of geotechnical studies having been performed.

For these reasons we request that you seriously review your plans and reconsider the DEIS and provide us with other workable alternatives.

Sarma Davidson

Sarma Davidson,
Chairperson

Sarma Davidson	Inta Wiest	Valdis Jodais	Talis Jaundalderis	Aina Uskurs	Ingrid Doherty	Paul Kalnins Daina Kusins
Chairperson	Vice-Chairperson	Treasurer	Assistant Treasurer	Secretary	Membership	Board Members

C-030-001

The Sound Transit Board directed Sound Transit to explore a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained, although a small portion of land on the properties edge would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property, but an elevated design by the church is not the Preferred Alternative.

Several sections in the Final EIS have been updated to address these changes including: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

C-030-002

Based on the comments from the Association, the church and many others, Sound Transit has updated the design of the at-grade alternatives as well as the discussions of impacts to the church. The Final EIS has further discussion of the avoidance, minimization and mitigation measures that the Preferred Alternative and other alternatives would incorporate. The presence of I-5 to the west limited options for realigning the tracks without creating more impacts to adjacent properties, but the Preferred Alternative and other at-grade alternatives, have a revised design that maintains access to the church. The design and analysis for the Final EIS has also further defined a realigned

access road that would be rebuilt to current standards, along with a rebuilt sound wall. The caretaker's building would be relocated, and Sound Transit would work closely with the church to identify a suitable relocation option. Vibration and noise impact information has been updated as well. The vibration analysis incorporated the results of geotechnical studies that included borings along with soils analysis. Section 4.7.3 of the Final EIS discusses noise and vibration impacts and Section 4.7.7 describes the proposed mitigation measures that would be applied. Section 4.5.2 discusses long term visual impacts and Section 4.5.3 discusses short term visual impacts, and mitigation measures for visual impacts are discussed in Section 4.5.6. Section 4.13 of the Final EIS discusses electromagnetic fields, which are produced whenever electricity is used. No sensitive receptors (i.e. hospitals, radio stations) are within the range of the light rail line, and it is not expected that the light rail would interfere with the Latvian Evangelical Lutheran Church's radio.

LETTONIA
STATE OF WASHINGTON ALUMNI ASSOCIATION

September 14, 2013
Mukilteo

Sound Transit
Draft EIS Comments
c/o Lauren Swift

I am writing to you on behalf of the 22 current members of Latvian fraternity Lettonia State of Washington Alumni Association. Lettonia uses the Seattle Latvian Community Center several times a year for our chapter meetings and important celebrations, like our annual anniversary of the founding of the fraternity in 1870. More importantly many of Lettonia's members were among the Latvians who volunteered both time and money to build the existing facility at 11710 3rd Avenue NE. Because of the work and money the many Latvian fraternities devoted to the Center, we were granted free use of the Center's facilities. Losing this means we will have to use our membership dues to pay for facilities, rather than donating the money to educational causes, like the Latvian school.

All of us have been or still are active in other groups (church, seniors group, choir, folk dancing, golf association) associated with the center, including in leadership roles in these groups, so we will feel the disruption due to the impacts there too.

C-031-001

We request that the Sound Transit board take into account the needs of the Baltic community that utilizes this facility, find mitigations that will allow the Center to remain in its current location and continue to serve this very unique population.

Eric Raist

Northgate West Condominiums
11300 1st Avenue Northeast
Seattle, Washington 98125

Sound Transit
401 South Jackson Street
Seattle, Washington 98104
Attention: Lauren Swift, Lynnwood Link Extension DEIS

Dear Seattle Sound Transit:

The owners and residents of Northgate West Condominium have the following concerns and suggestions regarding the proposed route of light rail from Northgate to Lynnwood.

C-032-001 First, we wish to throw our support for the A1 proposal. We feel this will have the least impact along First Avenue Northeast. However, Sound Transit *must* make sure that we have ingress to and egress from our property at all times, as that is the only unencumbered entry/exit from our property.

C-032-002 Additionally, we ask that Sound Transit work with the City of Seattle to install a left-turn signal from Northgate Way on to First Avenue Northeast to mitigate the loss of the bridge that crosses I-5. Without that mitigation, it will be difficult for vehicles exiting and entering our property.

We also wish to express our concerns:

C-032-003 The trees that line First Avenue Northeast are over 30 years old and irreplaceable. They screen noise from the highway, act as a dust screen to clean the air, and are visually attractive. Additionally, they provide shade and offer protection from the wind. Many studies have shown that people are happier and healthier when they look at natural, green scenery. We would hope that Sound Transit will do everything possible to preserve these trees, up to and including relocating them along the avenue, before considering chopping them down and replacing them with younger trees.

C-032-004 Damage to our property as a result of construction must be monitored. We are specifically concerned about cracks in the asphalt and the foundation of the building on our property. We understand that soil samples were taken, and we would like to see a copy of the report in order to better understand any potential impact on our property.

C-032-005 We also would like noise-monitoring and vibration-monitoring devices placed on our property to monitor the noise and vibration levels during and after the construction of the light rail and the running of the trains.

Very truly yours,

The Owners and Residents of Northgate West Condominium (see attached list for signatures).

C-032-001

Your support for Alternative A1 is noted. During construction, access to your property will be maintained.

C-032-002

Although Alternative A1 was the basis for the Preferred Alternative, the Preferred Alternative does not require a reconstruction of the NE 117th Street overpass. If the overpass were to be reconstructed for the project, Sound Transit would coordinate with the City of Seattle for any changes to the intersection configuration or signal operation at Northgate Way and First Avenue NE, or for any other solution needed to maintain access via First Avenue NE.

C-032-003

As shown in Appendix F, Conceptual Plans, the proposed alignment extends through the trees on the east side of 1st Avenue NE in the vicinity of Northgate West Condominiums, and some tree removal would be required. Trees provide fairly low levels of noise reduction, but Sound Transit has evaluated the potential for increased noise due to the light rail project at the condominiums, and noise barriers on the elevated guideway would be part of the project as mitigation. Sound Transit will also comply with all applicable tree protection and replacement standards in City of Seattle Municipal Code Chapter 25.11. Potential mitigation measures are described in Section 4.5.5 (Visual and Aesthetic Resources) of the Final EIS.

C-032-004

During construction, Sound Transit would minimize the use of vibratory soil compactors and vibratory hammers near structures that are determined to be vibration-sensitive. Sound Transit would also avoid conventional vibratory hammers that have the potential to cause objectionable vibration and risk cosmetic damage. See Section 4.7.7 of

the Final EIS for further information on potential mitigation measures. Geotechnical analysis continues through final design. Geotechnical Reports can be obtained by contacting community outreach staff identified in the Draft and Final EIS.

C-032-005

The Draft EIS identifies two construction activities with the potential to cause damage to adjacent buildings due to vibration during construction of the Lynnwood Link: vibratory pile driving and soil compaction using vibratory rollers. Sensitive structures along the alignment are at risk of cosmetic damage (the earliest indication of damage) wherever vibratory pile driving is conducted within 80 feet of a sensitive structure or a vibratory roller is operated within 40 feet of a sensitive structure. The distance to the nearest track at 11300 1st Avenue NE, Seattle is 38-45 feet, depending upon the alignment alternative. Therefore, vibration monitoring will be conducted at the building if any of the above activities are conducted next to the property. See Section 4.7.4 of the Final EIS for more information on construction impacts and Section 4.7.7 discussion of mitigation measures.

Vibration levels from running trains will be below the threshold of human perception at the property and, subsequently, will be far below levels posing any risk to the structure. Therefore, vibration monitoring of running trains is not warranted. See Section 4.7.1 of the Final EIS regarding the FTA criteria used to evaluate sensitivity to noise and vibration.

Seattle, WA 98104

Subject: Comment on Lynnwood Link Light Rail Draft EIS

Dear Mr. Iwata and Sound Transit Board:

Please accept our comments on the Draft EIS for Lynnwood Link Light Rail Project.

Paramount Park Neighborhood Group is a non-profit, grassroots organization incorporated in 1994, working for the protection and preservation of the neighborhood and ecosystem as it relates to Paramount Park Open Space and its related watersheds. It is composed of citizens and board members who all live in the neighborhood directly affected by the proposed North Corridor Transit Project and Light Rail Station area.

The Group seeks to bring individuals, groups and governmental entities and businesses together to address the issues relevant to preserving and protecting the beauty, natural features, hydrology and wildlife habitat found in and around Paramount Park Open Space.

The Group undertakes projects to preserve, protect and restore the eco-system native to the park, including, but not limited to: vegetation, streams that flow through the park, wetland areas within and around the park, and wildlife habitat within and around the park.

The Group sponsors and promotes educational programs, increased public awareness, facilitation of the exchange of ideas and information regarding events, projects or developments relevant to the park and related water shed preservation and protection projects.

C-033-001

We request "party of record" status with Legal Standing in this matter.

Please include our comments in the hearing record, and consider them in your administrative review and notify us of any and all meetings, hearings or updates on this proposed project.

We are concerned about severe, adverse environmental impacts of this project, which cannot be mitigated with the current proposal. These impacts would include direct, indirect and cumulative impacts of the project to the environment, especially to the surrounding neighborhood. We believe our citizens, neighborhood and our environment would be impacted in a number of ways by the current proposal including, but not limited to: increased traffic congestion, reduced traffic safety, inappropriate housing density, reduced water quality and quantity, increased localized flooding, increased taxes and other financial costs including reduced property values, increased air pollution, noise and glare, loss of wildlife and habitat, tree loss, loss of scenic and other aesthetic values, increased carbon impacts, and loss of their procedural due process rights.

We incorporate by reference, our original scoping letter dated April 23, 2012, and all of the comment letters received at that time. We also incorporate by reference all documents, studies and comment letters submitted to date on the DEIS process. We also incorporate the Shoreline South East Subarea Plan, adopted by the Council in 2012

http://www.shorelinewa.gov/index.aspx?page=178

and the Shoreline Sustainability Strategy adopted in 2008.
http://cosweb.ci.shoreline.wa.us/uploads/attachments/pds/esc/COMPLETE_FinalSESStrategy2008July.pdf

Position on Best Alternative

C-033-002

Paramount Park Neighborhood Group recognizes (with some trepidation) that the NE 145th proposed location would likely be the best for the Lynnwood Link Station Area. We agree with the position taken by the City and some in the 145th/155th Station Citizens Committee that the 145th Station offers the best access and the best opportunity for improvements to NE 145th (St Rt 523). And though it will bring about huge changes to our immediate neighborhood, it may be less disruptive than if it were built at NE 155th.

C-033-003

However, we are extremely concerned that the DEIS states in section 4.2.6 that "no mitigation related to land use would be required during construction or operation." It seems obvious to us that when you have a huge project plowing through an entirely single-family neighborhood, there would naturally have to be an "adverse impact" which needs to be mitigated.

Recommendation — *We recommend that the project administrators look for ways to specifically address all negative impacts whether perceived or tangible and mitigate them.*

C-033-001

There is no "party of record" designation for the environmental review process. Janet Way, member of the Paramount Park Neighborhood Group, has been added to the Lynnwood Link Extension project email update list.

The Draft EIS identified specific impacts due to each of the alternatives in various elements of the environment, and also described potential mitigation measures. High levels of adverse impacts in the areas of concern listed would not result with the proposed project design and the incorporation of best practices and mitigation measures. The project would not result in additional flooding, and in several areas would address existing problems for stormwater treatment and retention. Worsened congestion and safety are also not anticipated, and in a number of cases would involve improvements compared to No Build. Sound Transit is not proposing changes in zoning or densities in surrounding neighborhoods, although the potential for local jurisdictions to consider changes is evaluated as an indirect impact.

For impacts and proposed mitigation associated with traffic congestion and safety, please see Chapter 3 Transportation. See Chapter 4 Environmental Impacts and Mitigation for impacts and proposed mitigation associated with housing density changes as an indirect potential impact (Section 4.2 Land Use); water quality and quantity, including flooding (Section 4.9 Water Resources); tax base and property values (Section 4.3 Economics); air pollution and carbon impacts (Section 4.6 Air Quality and Greenhouse Gases); noise (Section 4.7 Noise and Vibration); glare, scenic and aesthetic values, including trees (Section 4.5 Visual and Aesthetic Resources); and loss of wildlife and habitat, including tree loss (Section 4.8 Ecosystem Resources).

C-033-002

Your preference for the 145th Street Station location is noted.

C-033-004

1) **Noise -**
Elevated Rail has been shown to be a major problem for noise and vibration pollution for nearby communities which have already experienced Light Rail projects. The DEIS admits in section 4.3.4 that there will be "Indirect or Secondary Impacts" which could bring "Disruptive noise levels" potentially from elevated transit that could impact communities economically. But we do not agree that these are "indirect impacts." These would be more accurately labeled as "Direct Impacts." They could result in health or safety problems for residents and property value reductions in adjacent areas.

Recommendation *– Noise and vibration must be addressed to reduce impacts that could negatively damage and degrade the community as they have in other neighborhoods where Light Rail has been established. More studies should be done to develop technology that will reduce the noise and vibrations. It seems to us that noise and vibration generated from Elevated Transit would be a "Direct Impact", and should be mitigated by tree planting, walls or berms to eliminate negative blows to community well-being.*

2) **Traffic and Parking –**

C-033-005

State Rt 523 is a major highway and traffic connection between Shoreline, Seattle, Lake Forest Park and cities on the "Eastside" and Interstate 5 and Aurora Ave N (Hwy 99). It is a major alternative route for commuters and community users who avoid the tolling on the 520 Bridge. Many sensitive single-family neighborhoods lie just to the north of this route within the half-mile station area. This stretch of road is currently very congested during rush hours and experiences many vehicle collisions and other safety problems.

It is also a major Metro Transit route which could provide access to the Light Rail station and provide alternatives to single automobile trips, but only if the narrow highway is improved and retrofitted. This route also poses major safety problems for pedestrians and bicycle riders, but which could also offer improved use and safety if it were widened and improved.

Currently this route is also a major source of noise and air pollution.

Without mitigation and major improvements for this route the 145th Station Area would not be successful. The problems cited above must be addressed in order to provide a truly walkable Station Area for Light Rail.

We are also very concerned that the City of Shoreline and City of Seattle and their taxpayers will be left with the economic burden of upgrading and retrofitting all of the roads and other infrastructure that will be necessary to integrate and connect this

C-033-003

No mitigation is presented under the discussion of land use because the light rail project would support long-range planning and growth management policies and goals as stated in Section 4.2. The Lynnwood Link Extension project is consistent with the City of Shoreline *2012 Comprehensive Plan*. The discussion of land use impacts in Section 4.2.2 also acknowledges other related long-term and construction impacts to the neighborhood in the introductory paragraphs of Section 4.2. Please see the discussion of impacts and proposed mitigation in the following sections: Chapter 3 Transportation; Section 4.1 Acquisition, Displacements, and Relocations; Section 4.4 Social Impacts, Community Facilities, and Neighborhoods; Section 4.5 Visual and Aesthetic Resources; Section 4.6 Air Quality and Greenhouse Gases; Section 4.7 Noise and Vibration; and Section 4.17 Parks and Recreation Resources.

C-033-004

It is Sound Transit's policy to mitigate light rail transit noise and vibration impacts that would otherwise result in moderate or severe impacts, consistent with published FTA guidance. See Section 4.7 of the Final EIS for updated direct impact and mitigation information for noise and vibration. Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts.

The discussion of noise as a potential indirect economic impact in Section 4.3.4 was in the context of a review of combined effects of the project in ways that could reduce economic or business activity; with mitigation of the direct noise, traffic, property and other related impacts, the section describes a low potential for adverse economic impacts, and a good potential for positive economic effects.

Tree replacements and replanting are being considered for mitigation for visual impacts, and both WSDOT and local jurisdictions have tree or

C-033-005

Light Rail service to our community. Our taxpayers are already paying a great deal of revenue into this system with little benefit thus far.

Recommendation *– Follow through with studies on how to retrofit Rt 523 to accept the traffic, transit stops, widen sidewalks, add bike lanes, and pedestrian crossings, potentially with a traffic light, mitigate noise and air pollution and radically improve safety to improve access for the public to utilize the Light Rail Station to the maximum extent.*

C-033-006

3) **Walkability, Bicycle and Transit Impacts –**

There are many opportunities to improve walkability and public safety and quality of life that could easily be implemented in the Ridgecrest neighborhood with the Light Rail project.

Paramount Park Open Space and Jackson Park contain excellent trail opportunities that are currently, already used by bike and pedestrian commuters. But the existing trail on 148th across Littles Creek experiences wash-outs nearly every year. The undersized culvert there needs to be replaced with a "box culvert." The replacement of this culvert would serve several purposes, improving stream function and enhancing the trail for safety.

C-033-007

Light Rail should not displace bus ridership, but it should be designed to be coordinated and build transit of all forms.

Circulator buses should be provided for cross-town to bring riders from all parts of Shoreline and North Seattle, especially from schools and Shoreline Community College. There should also be improved opportunities for handicapped access to sidewalks and transit, with increased usage of handicapped access vans. The DEIS mentions little about serving this community.

C-033-008

Development of light rail should not be an excuse to put tolling in place on I-5 to increase revenues. This would only decrease support for Light Rail ultimately and not increase likelihood of success.

C-033-009

Recommendation *–we suggest that planners refer to the SE Subarea Planning documents for ideas on how to improve pedestrian safety throughout this older neighborhood. Particularly, attention should be paid to connections between Jackson Park, Paramount Park Open Space and 15th Ave NE. Sidewalks and LID projects should be deployed to improve drainage as well as walkabiltiy. Bike lanes and biking facilities should be developed at the Light Rail station area, with bike lockers and storage.*

C-033-010

4) **We believe that the stormwater runoff is not being adequately addressed, and negative impacts to Thornton Creek will be adverse.**

Light Rail **cannot** be built to Shoreline along the I-5 corridor without impacting

vegetation replacement requirements that will apply to the project, but vegetation offers limited noise abatement value.

C-033-005

Table 3-26 in the Draft EIS identified where mitigation would be needed to address the project's impacts near the NE 145th Street Station, including due to additional traffic using NE 145th Street (SR 523) to access the station and/or park-and-ride garage. This information has been updated in Table 3-27 of the Final EIS. Other features of the project, including for station area improvements for transit, pedestrians, and bicyclists, have been identified through further planning for the Preferred Alternative; please see section 2.5 of the Final EIS for more details. Sound Transit is not required to improve existing deficiencies in areas that are not adversely affected by the project. In a separate effort, the City of Shoreline, in coordination with Sound Transit and WSDOT, is conducting a study to review potential improvements along NE 145th Street, including at the NE 145th Street and I-5 interchange, to improve traffic operations, connections and safety for all modes in the area.

C-033-006

The project is being designed to encourage the use of walking and biking to reach the station and connect to the surrounding communities. Streets and station areas reconstructed as part of the project will accommodate pedestrians and bicyclists consistent with applicable city standards and plans. Sound Transit is aware of the community's interest in enhancements at Paramount Park and the open space, and the agency has included these areas in a planning review of potential candidate sites for natural resource mitigation, but site requirements would depend on the permitting requirements for the project to be built. As the project enters final design and permitting, Sound Transit will continue to coordinate with the City of Shoreline and other permitting agencies to finalize the project's approach to meeting permitting requirements.

C-033-010

Thornton Creek and its associated wetlands. This is just a reality. Interstate 5 was built in the middle of an extensive wetland system. The remnants of that system remain alongside the freeway. There is a significant wetland at 148th and the Freeway. It is mapped. There are wetlands quite obviously associated with the creek corridor along Fifth Ave and at Twin Ponds area (Peverly Pond at Aegis is another example). While these wetlands are somewhat degraded, but continue to be important headwaters wetlands for Thornton Creek and must be protected!

C-033-011

Thornton Creek is the largest watershed in Seattle and Shoreline. The creek runs under I-5 and has a major tributary, Littles Creek running under NE 145th. Littles Creek at Paramount Park Open Space is associated with largest wetland system in Shoreline. Over 40 bird species have been observed in Paramount Park, including Pilleated Woodpecker, Raptors (Bald Eagle, Sharp-shinned Hawk, Red-tailed Hawk, Peregrine Falcon), Great Blue Heron, and Band-tailed Pigeon. Thornton Creek is critical habitat for five species of salmonids, including Chinook and Steelhead (a steelhead was observed in a reach of Thornton Creek, just north of NE 155th St in 2004. It was confirmed by three biologists from several governing authorities, including WDFW). There are also sensitive wetlands associated with the creek corridor, which are constrained next to Fifth Ave NE in the path of the Lynnwood Link route.

The DEIS failed to study the upstream areas or the overall, cumulative impacts of Elevated or At Grade Light Rail Tracks and Station areas on wildlife habitat.

Other Critical Areas and stream systems are mentioned in the DEIS, including McAleer Creek. It well known to contain important salmonid populations.

All the creeks in the study area are distressed due to impacts from stormwater inundation. LID teechnologies utilizing natural drainage systems, swales, native plantings and should be used to retrofit existing drainage along with this project development.

Recommendation *– We request that more study and LID methods be detailed and deployed to find ways to retrofit Thornton Creek where the Lynnwood Link intersects with it and also mitigate the damages by providing more quality open space and improvements for Littles Creek to enhance pedestrian and bike usage and water quality and wildlife habitat. The culvert under I-5 should be retrofitted for improved fish passage. There are existing technologies that can do this with a minimal effort. The mistakes of the past in Thornton Creek need not be perpetuated by our State, regional and local governments. Salmon will return if fish passage is improved to allow return to existing wildlife habitat upstream. Salmon recovery is a goal of every governing body that is charged with completing a Light Rail system. It should not just be a lofty goal, but an achievable objective.*

5) **Open Space and Parks –**

C-033-007

Sound Transit coordinated with King County Metro and Community Transit on initial assumptions on bus service to the stations, but decisions on final service levels and routes would be defined through a public planning process occurring closer to system opening. The conceptual service plan assumes higher levels of feeder service to the station along east-west arterials, but also includes north-south connections. Service on some current routes that duplicate the project's proposed service and major regional connections could be redirected by Metro because riders are likely to prefer the faster, more frequent and reliable service offered by light rail. As described in Section 2.3 of the Final EIS, all stations would be accessible as required under the Americans with Disabilities Act (ADA), and would include pedestrian and bicycle access to and from feeder bus lines, park-and-ride facilities, and surrounding streets. They would be designed to satisfy all applicable public access, and life safety requirements. As described in Section 3.2.5 of the Final EIS, Sound Transit would continue to develop the project's pedestrian and bicycle improvements at Lynnwood Link Extension stations consistent with its current System Access Policy.

C-033-008

Tolling I-5 is not a component of the Lynnwood Link Extension project. Tolling I-5 would be a decision of the Washington State Legislature and wholly independent of this project.

C-033-009

Currently, the project is assuming that all streets reconstructed with the project will be built to current standards for bicycle and pedestrian facilities. The station sites will also accommodate pedestrian and bicycle connections, and will include areas for bike parking and storage. Several of the streets being rebuilt in station areas include bike lanes, as called for in City of Seattle and City of Shoreline transportation and bicycle plans. Improvements to other areas not altered or adversely

C-033-012

With increased density, more Open Space is a crucial element of successful communities and walkability, and one that is called for the Shoreline Comprehensive Plan. Protecting critical habitat is also a necessity in order to protect our water and air quality.

There are several important parks that are in the Station Area that should be enhanced and retrofitted for the expanded use that should naturally come from increased density and walkability desired by planners and citizens anticipating the Lynnwood Link Light Rail project.

However, it is a major oversight in the DEIS that many important parks, open space and environmental assets are NOT EVEN MENTIONED! For instance, in Section 4.17.1, Jackson Park and Twin Ponds Park are discussed, but Thornton Creek (the largest creek system in both Shoreline and Seattle) is not mentioned! Neither is Paramount Park Open Space, which offers major commuter trail and recreational trail routes and contains the largest wetland in Shoreline and a vital tributary, Littles Creek. Paramount Park Open Space is within a .5 mile of the Light Rail route, but it is not included in Open Space analysis. This is not acceptable.

C-033-013

Paramount Park Open Space and Jackson Park are the closest parks to the 145th Alternatives. These two parks should have a natural connection at Eleventh Ave NE, both for the community and for wildlife. Both have very important pedestrian access components and needs for improvements. Also, there are several other parks nearby. Paramount School Park is an important recreational asset, with the Skateboard facility and Ridgecrest Park has handball courts and ball fields that are valued by a segment of the citizenry. Also, Twin Ponds Park has a significant section of the North Branch of Thornton Creek running through it.

A traffic light and crosswalk should be installed at Eleventh NE or Tenth NE to allow for safe pedestrian crossing and an alternate entrance to Paramount Park Open Space. The City has considered purchasing the "Jackson Plateau" property there, as an addition to Paramount Park Open Space, since a development of a cul de sac project there failed. It has been listed on the Shoreline "Pro Parks" plan as a possible acquisition. It is a natural wildlife corridor, which could connect these two assets for recreation and walkability in the Seattle *and* Shoreline neighborhoods of the station area.

Paramount Park also needs a great deal of work on trail improvements. A "box culvert" should be installed at 148th to better contain flooding in Paramount Park. And the culvert for Littles Creek under NE 145th must be replaced to restore fish passage. These are all relatively inexpensive improvements that need to be addressed to provide walkability and mitigate damage to the Thornton Creek Watershed, which Light Rail will inevitably affect.

affected by the project are not proposed. Sound Transit will continue to work with local jurisdictions to finalize the projects' station access plans, consistent with Sound Transit's System Access Policy.

C-033-010

Sound Transit recognizes the importance of Thornton Creek and its associated wetlands, and the agency has conducted initial mitigation and permitting planning for the project that considers opportunities for mitigation sites within the Thornton Creek watershed. Federal, state, and local regulations may require Sound Transit to mitigate impacts on wetlands and buffers using an approved mitigation bank (if available in the future), King County in-lieu fee program, or project-specific mitigation developed by Sound Transit. If project-specific mitigation is developed for this project, site selection would emphasize a watershed approach. Section 4.8 of the Draft EIS describes resources and potential impacts and proposed mitigation.

C-033-011

Sound Transit's Ecosystems Technical Report accompanied the DEIS and provided greater detail on resources in the project area. The technical report, now updated for the Final EIS, also describes the study area and the methods used to identify areas likely to be affected by the project construction and operation. During scoping for the EIS, the project's proposed analytical methods were reviewed by a variety of agencies with jurisdiction and natural resource expertise. The analysis of ecosystems impacts, including impacts to fisheries and wildlife habitat, was conducted and coordinated with the water resources analysis discussed in section 4.9. Finally, further information has been developed for a Biological Assessment in conjunction with Endangered Species Act compliance; see Appendix O of the Final EIS. Sound Transit policy requires all projects to consider low-impact development (LID) methods as a first choice for stormwater treatment. The project will review the feasibility of LID strategies as part of the project design, in conjunction

C-033-013

Recommendation *– Follow up with studies and implementation to improve open space access and walkability in the immediate neighborhood. Review and reanalyze impacts to environmental assets in local parks and how the Lynnwood Link might affect them. Include Paramount Park Open Space and Thornton Creek in this analysis. Consider improvements to these assets as mitigation for needed improvements to walkability and bicycle commuting.*

C-033-014

6) **Neighborhood** –

If the Lynnwood Link is to be built, there will undoubtedly be many changes to our quiet, single-family neighborhood. These changes must be carefully implemented and properties that are affected must be adequately compensated and transitions to single-family neighborhoods must be gradual and carefully planned. Quality community design elements must be included to improve walkability and preserve quality of life.

Recommendation *– Use the recommendations in the Southeast Subarea Planning Effort completed in 2012 to improve the neighborhood when Light Rail is implemented.*

C-033-015

7) **Air Pollution and Carbon Footprint** –

We are concerned about what the true "carbon footprint" impacts of this project would actually be. Considering the likely possible tree losses in the route of the rail line between Northgate and through Shoreline and carbon footprint of the massive amounts of concrete which would be utilized for construction of elevated pilings, parking garages, plazas, and station areas, we question the actual calculation and ultimate value in the region's investment in the Lynnwood Link.

C-033-016

There are literally thousands of valuable mature trees of many varieties along the proposed route. These trees are now providing excellent services mitigating the air pollution, shading, wildlife habitat and stormwater runoff in the corridor from freeway traffic and vehicle pollutants. The corridor and associated development proposed for the elevated structure for the Lynnwood Link would most likely destroy most of those trees. There must be mitigation included which would provide a 3-1 replacement value for those trees particularly the "native" conifers which offer the most in environmental services.

C-033-017

Also we are concerned about additional traffic congestion, which will undoubtedly result from this project in the immediate and nearby neighborhoods and the pollutants that will be generated. How will those impacts be mitigated? The answer cannot be that no parking will be provided for the passengers of Light Rail, otherwise ridership will be inadequate to justify the entire project.

with project permitting. Sound Transit would minimize the potential for interference with possible future fish habitat restoration projects from construction of the light rail alternatives by designing and locating project features to avoid Thornton Creek.

C-033-012

As described in Section 4.17 of the Draft EIS, parks, recreational resources, and open spaces located more than 0.25 mile from station locations or 300 feet from light rail tracks would not experience direct impacts from the project. Paramount Park is outside the general study area used for parks (see Figure 4.17-1), and there were no environmental topic areas that identified adverse effects extending beyond that distance. Based on the Draft EIS analysis and the updated Final EIS findings, a station at NE 145th Street would not result in adverse direct or indirect impacts to any designated open spaces associated with Thornton Creek (Park #1 was identified in Table 4-17-1). Impacts to Jackson Park would be primarily visual. Therefore, no mitigation at those parks is proposed except to address visual impacts at Jackson Park. Potential changes in allowable density would be an action taken by local jurisdictions, if at all, and not by Sound Transit, but are discussed in the indirect impacts section in each environmental topic area. The potential impacts and any mitigation due to increased density would be considered during the planning and environmental review for any comprehensive plan changes by the local jurisdictions, as well as for the local approvals for potential developments by others.

Potential impacts to Thornton Creek are discussed in Section 4.8 of the Draft EIS, Ecosystem Resources.

C-033-013

Please see response for comment C-033-012.

C-033-018

Recommendation –

We request that the maximum number of trees should be retained whenever feasible, and any that are cut should be replaced on site or nearby with a 3-1 ratio, preferably with

C-033-019

conifers and native species. The carbon generation should be offset with solar and other renewable technologies in the development of the station area.

C-033-020

8) <u>Light Rail Station Area Planning</u> –

The Light Rail Station area should be a major center for community connection, architecturally attractive and economic improvement and not just an expensive, huge concrete mausoleum for parking and a reason to cut a huge number of trees that have grown up to screen our neighborhoods from I-5 over the last 50 years.

We believe it should include opportunities for retail establishments, which can provide useful services to commuters and local residents. Restaurants and other service providers should be included. Lighting and glare should be considered and designs should provide technologies to save energy and shield surrounding communities form their impacts. Signage should be attractive but not dominant.

Recommendation –
We recommend maximum usage of green technologies in the construction of these buildings and additions of community assets such as opportunities for smart cars sharing, bike share, bike lockers, adequate parking to increase ridership, numerous transit connections, meeting rooms, plazas with eating areas, shading, native landscaping, artistic and decorative design which reflect the Northwest culture.

We look forward to working with the Sound Transit Board and all the entities that will be doing the implementation of this planning effort.

Thank you for your consideration.

Respectfully submitted,

C-033-014

The Draft EIS acknowledged that construction of the station, parking garage, and other facilities would alter the visual characteristics between the highway and the adjacent single-family residential neighborhood, and would also remove several single family homes at the edge of the neighborhood. After mitigation and improvements to address traffic and circulation needs, other direct changes to the neighborhood would be limited. For a more detailed discussion of visual impacts and mitigation, see Sections 4.5.2 and 4.5.7, respectively. Other sections found low to moderate effects for a station adjacent to I-5 at an existing freeway interchange and at the intersection of two major arterials. For additional information refer to Section 4.4 - Social Impacts, Community Facilities, and Neighborhoods in the Final EIS.

Longer-term changes in the neighborhood could occur if local jurisdictions amend plans governing allowable uses of properties adjacent to the light rail transit station. These would be local decisions made by local jurisdictions, and are not proposed by Sound Transit. Section 4.2.4 discussed the potential for impacts due to land use changes by local jurisdictions.

The project also includes amenities and improvements such as bike facilities on rebuilt sections of 5th Avenue NE and improved sidewalks in the station area.

C-033-015

During final design, Sound Transit would consider opportunities to plant trees, consistent with the sustainability policy, which recognizes the benefits tree plantings would have; plantings are also likely to be a condition under various permits required for the project. Please refer to the visual and ecosystems sections for more details on specific mitigation commitments that would include replacement plantings.

Janet Way, President
Paramount Park Neighborhood Group

The Draft EIS estimated the greenhouse gas emissions during construction by using several sources, including information based on the agency's own projects that are similar in scale and construction methods to the Lynnwood Link Extension. Producing and disposing of materials needed to build the project will also produce greenhouse gas emissions, which would be an indirect effect of the project. However, at this time, there is no standardized methodology for calculating the embodied and lifecycle emissions from transportation projects.

C-033-016

Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects. Sound Transit will comply with all applicable tree protection standards in local jurisdiction codes.

C-033-017

Mitigation measures for any impacts from traffic congestion as a result of traffic accessing a station or park and ride will be included as part of the project. No adverse air quality impacts are expected. Analysis of potential air quality impacts is provided in Section 4.6 of the Draft EIS.

C-033-018

Please see response to C-033-016.

C-033-019

Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on petroleum conservation and renewable fuel and energy is to work with energy providers to maximize the percentage of renewable energy purchased.

Sound Transit's approach to incorporating sustainability opportunities into its facilities is summarized in Section 2.6 of the Draft EIS.

C-033-020

The project does not propose specific other uses such as retail, but Sound Transit policy encourages potential partnerships for transit-oriented developments (TOD). Sound Transit's TOD and Sustainability Policies will continue to be applied during final design. See Section 4.5 for visual impacts and mitigation.

To the Board of Sound Transit:

C-034-001

The Seattle Latvian Lutheran congregation is experiencing a feeling of *deja vu.* Yet again it has become a possibility that our church and community center will be taken from us, as it was 44 years ago. For the older members—this is the place they built with their hands, volunteering their time, after work and on weekends. Built not only with brick and mortar, but also with hopes and dreams—a center for their children and grandchildren, so that they too could learn about their Latvian heritage.

In the 42 years since we are in our present location, this has become our Latvian church home. It's where we gather on Sundays to worship in the language of our heart—the only place in Seattle, where services are held in Latvian. And, since our community has now grown to include many "adopted Latvians" who many not speak the language, but do feel at home—we also have services once a month in English.

It's the spiritual home to which our children and grandchildren return for Christmas and Easter. It's where we celebrate the birth and baptism of our little ones. (Next Sunday, we will be baptizing Kevin Erik, whose mother was also baptized in our church—a continuity that adds richness of meaning for both parents and grandparents!)

It's where we rejoice with young couples (and occasionally, not so young!) as they set out on the journey of marriage—and where we mourn those whose life journey has come to an end. In church, our family home.

I speak for all of us—the founding members who built our church, their children who are now bringing their own children here, as well as our dear "adopted" Latvians: it is our hope and our prayer that this time it won't be *deja vu,* that Sound Transit will find a way to let us remain in our church home that is so important to our lives.

Sincerely,

Pastor Daira Cilnis

C-034-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. See Section 2.5.1 for a description of the refined Segment A alternatives that avoid displacing the church.

Re: Lynnwood Link Light Rail Extension

C-035-001 I am writing on behalf of the Latvian choral ensemble Sigulda, based in Seattle. Our 25 member group was established in 1985 and has performed at multiple events in the Seattle area over the years. Our group sings for Latvian functions and church services, as well as for other community performances, including Northwest Folklife and the Bellevue Sister Cities Association.

It is a great concern to us that the Seattle Latvian Community Center is endangered by all of the alternatives currently proposed in the DEIS. We hold weekly rehearsals in the hall at the Center, located at 11710 3rd Avenue NE. We have always had a need for piano accompaniment and hence have never been able to fit rehearsals of that size in any one individual's home.

We urge Sound Transit to find an acceptable version of developing the light rail project through the Northgate area that allows the Seattle Latvian Community Center & Church to remain a vital, functioning property. There simply is no other location within the Baltic community that serves such a prominent role throughout the Pacific Northwest.

Please consider the needs of the local citizens who use this Center so frequently and on so many different levels, as you move forward with this project. Thank you for your consideration.

Sincerely,

Inese Bergman

Inese Bergman for Sigulda
611 Birch St
Edmonds WA 98020

C-035-001

Thank you for your concerns about the potential displacement of the Latvian Evangelical Lutheran Church and for highlighting its significance to the region's Baltic community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

Re: Lynnwood Link - Petitions against Alternative Routes C1 and C2

To: Sound Transit Board:

C-036-001

Attached are approximately 1,800 signatures on petitions against Routes C1 and C2. There are more petitions against C1, only because our group, Save Scriber Creek Park, did not unite with the residents and business owners against C2 until after the Sound Transit Meeting on August 21.

When we petitioned, we used the comparison chart (Chapter 5, Table 5-4 Comparison of Segment C Alternatives) and the map (Summary, Figure S-8, Alternatives C1, C2, and C3) from the DEIS so that people would understand what they were signing and had extra copies available as hand-outs. (See attached documents.) Almost without exception, the signers said that C3 was "the way to go"; " a no brainer"; "why are the other two routes even in the picture?" These are a few examples of their pro C3 comments.

We also told the people who signed the petition that their information would be sent only to the Sound Transit Board because many people expressed concern about how their information would be used.

If you have questions, I can be reached at (425) 776-5374.

Very truly yours,

Maryellen Walsh

Senior Services
Promoting the well-being of older adults

September 19, 2013

Sound Transit Draft EIS Comments
c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

On behalf of what we learned from 700 Boomer aged participants who attended our Aging Your Way gatherings across King County including Shoreline, I would like to comment on the draft EIS. While most people associate Senior Services with the current elder cohorts, which would be the Silent and Greatest Generation, we are also engaging with the Boomers. They are a large, vocal cohort with different desires and values about what kind of community would support their aging.

What we consistently heard across the 12 gatherings and a summit we organized was a vision of the future that didn't require getting around in a car. We also heard a strong interest in sustainability and a desire to leave a positive legacy.

We are delighted that light rail is coming to Shoreline, the eastside, Capitol Hill and being extended south past the airport. This is how Boomers envisioned getting around along with a built environment that was pedestrian and bicycle friendly and with more frequent bus service. We also heard a lot about circulating shuttles. Boomers will more readily give up their keys when there are more transportation choices. This desire stands in stark contrast to their parents and grandparents who had to have the keys pried out of their hands.

C-037-001 So many Boomers we talked to would be puzzled about a project that is scheduled to come on line ten years from now that has parking garages at both of the proposed Shoreline stations. We understand that people who currently live there are concerned about people parking in their neighborhood. We wonder how relevant this will be 10-20 years from now when the station areas are rezoned for multi-family housing? Indeed this is the only kind of development that makes sense near a light rail station.

C-037-002 I would like to get back to the circulating shuttle idea which was popular amongst Boomers. Why wouldn't this work in the short term (ten years from now) for getting the people who don't want to drive to the station or for whom walking and cycling is not an option?

C-037-003 In closing, the Boomers we talked to support strategies that are sustainable. Auto dependent strategies are not sustainable and that translates into Boomers being bad ancestors.

Sincerely,

Joanne Donohue, VP

Cc: Shoreline City Council

(p) 206 448-3110 • (TTY) 206 448-5025 • (f) 206 448-5766 • www.seniorservices.org

C-037-001

Please note that the majority of patrons for most stations would be arriving via transit, walking or biking, but parking is still expected as part of a solution that attracts patrons who might otherwise make the trip on congested highways.

The parking supply levels currently proposed reflect continued projections showing demand for parking as one element of an effective multimodal access plan, consistent with Sound Transit's adopted System Access Policy. Even with potential redevelopment in station areas, the project is being designed to serve the larger north corridor area, which is densely developed, largely residential and constitutes a large population that uses park and rides and transit today to reach jobs and destinations at the regional centers in the north and south, including downtown Seattle, Northgate and Lynnwood.

C-037-002

The plan for transit service connections to stations will be refined in coordination with partner transit agencies and local jurisdictions as the project approaches the start of operation; in King County, this planning would be led by King County Metro. The project's current transit integration plan for the project anticipates frequent local services connecting to the stations, most of which connect to other activity centers east or west of I-5, but circulators could be considered.

C-037-003

Comment noted.

Sound Transit Board
c/o Roger Iwata
Union Station
401 S Jackson St
Seattle, WA 98104

Re: Lynwood Link Light Rail Draft EIS

Dear Mr. Iwata and Sound Transit Board members:

C-038-001

Thank you for this opportunity to comment on the Draft EIS for Lynwood Link Light Rail Project. Thornton Creek Legal Defense Fund hereby requests "party of record" status with legal standing in this matter, and also requests party of record status and legal standing for its board members, Janet Way and Patricia Sumption.

Although Thornton Creek Legal Defense Fund was present and made oral comments on the Lynwood Link Light Rail project in April 2012, we did not receive notice of this opportunity to comment on the Draft EIS. For that reason we were scrambling to get these comments written by the deadline. Please make sure Thornton Creek Legal Defense Fund stays in your records this time.

We request "party of record" status with Legal Standing in this matter

Thornton Creek Legal Defense Fund (TCLDF) is a non-profit organization begun to provide grassroots support to protect Thornton Creek, its tributaries, and their ecosystem.. TCLDF was incorporated in 1999. Its board and members are composed of citizens who live within the Thornton Creek watershed and beyond. These folks are concerned about the possible negative effects of the proposed North Corridor Transit Project and Light Rail Station area.

It is important to TCLDF that concerns of this and other neighborhood and citizens are heard, along with those of governments and businesses. TCLDF has worked in the past to accomplish goals that protect Thornton Creek and still accommodate other stakeholders and competing needs. We worked hard to bring all sectors to the table when we sought to daylight part of Thornton Creek south of the Northgate Mall and our efforts resulted in a project which included retail, condominiums and apartments, the daylighted creek, a small park, and parking facilities for the adjacent Metro Transit station.

C-038-001

There is no "party of record" designation for this project. Instead, interested parties are encouraged to sign up to receive periodic project updates and information disseminated by email. Sound Transit has added Patricia Sumption's and Janet Way's email addresses to the project update list.

C-038-002

Thornton Creek Legal Defense Fund and other citizen groups must be a part of the discussion and process again in the decisions to be made re the Lynwood Link Light Rail (LLLR). Urbanites need and desire to have natural beauty near where they live along with urban amenities. The Sound Transit Board must hear these voices and protect Thornton Creek and its wildlife, salmon, and other aquatic life. TCLDF also seeks to protect the hydrology, wetlands, and natural (native, where possible) vegetation. We also seek to protect amenities such as wildlife corridors, parks, and greenways for their own sakes and for the enjoyment of people living nearby. We are aware that this will not be easy since the I-5 Freeway is squeezed in tightly next to Thornton Creek in many areas through the proposed LLLR route, and that therefore the LLLR route will be very close to the Creek as well. The solutions to trying to put everything in the same place will not be easy to come by, but TCLDF feels it has expertise in helping to find solutions that will help the process, as evidenced by our success at the South Parking lot adjacent to Northgate Mall and the Metro Transit Center.

C-038-003

It appears that under the current proposal it may be impossible to mitigate harmful impacts on the environment. The proponents of the LLLR must consider direct, indirect and cumulative impacts on people living along this corridor and on the natural environment, including Thornton Creek. Since there may be problems achieving mitigation regarding these important issues, TCLDF must be allowed a place in the discussion of routes as well as mitigation efforts.

Together we must find solutions that deal with traffic safety, increased traffic congestion, potential excess housing density and height, effects on water quality and quantity necessary for humans and for fish and wildlife, loss of habitat and of wildlife. TCLDF seeks to protect the area against such impacts as well as others such as localized flooding, reduced property values, impaired air quality and added carbon emissions, reduced property values, loss of trees, increased noise and glare. If Thornton Creek Legal Defense Fund and Sound Transit Board accept such impacts as the necessary cost of expediting movement of people, we will create an environment which will send many people elsewhere, seeking a place where decision makers recognize the value of the natural environment and protect it as an absolute necessity.

C-038-004

Thornton Creek Legal Defense Fund has a number of concerns with the proposed Best Alternative for the LLLR. They include impacts related to problems with Increased Noise; Traffic and Parking; Walkability, Bicycle and Pedestrian Safety and Facilitation; Increased Stormwater Runnoff and its negative impacts on Thornton Creek and other water bodies; Open Space and Parks; Consideration for Neighborhoods; Air Pollution and Carbon Footprint; and Light Rail Station Area Planning. These points were all raised in the comment letter by Paramount Park Neighborhood Group on this Draft EIS and since we want to meet the deadline we will follow their lead on the specifics of these issues.

Having reviewed the comment letter from Paramount Park Neighborhood Group, TCLDF hereby adopts and incorporates into this comment letter on the D-EIS for the Best Alternative for the LLLR route, the comments in Paramount Park Neighborhood Group's

C-038-002

Sound Transit recognizes the importance of Thornton Creek and its associated wetlands. None of the alternatives would entail in-water work in Thornton Creek. Sound Transit also is designing the project to minimize the potential for construction impacts and for permanent facilities to interfere with possible future fish habitat restoration projects, including at Thornton Creek. Please see Section 4.8.6 Mitigation Measures in the Ecosystems section of the Final EIS. This section discusses Sound Transit's policy on ecosystems mitigation, calls for avoiding environmentally sensitive resources where possible, and requires mitigation to achieve no net loss of ecosystem function and acreage. The project's final design and permitting processes will also provide opportunities for interested parties to review design proposals and make comments.

C-038-003

The Draft EIS did not find a broad set of unavoidable and significant adverse effects that cannot be mitigated. The Draft EIS included a review of potential adverse direct, indirect, and cumulative effects in all topic areas required under NEPA and SEPA, and the Draft EIS has been subjected to the review of the public, including other resource agencies and jurisdictions. The Final EIS has further detail on Sound Transit's mitigation commitments for the Preferred Alternative and potential mitigation for other alternatives. The Summary section S.10 discusses areas where unavoidable adverse effects may remain after mitigation, and these would primarily be related to the removal of mature vegetation and trees in areas to be occupied by the guideway. The project would not directly lead to overbuilding or over-densification, as any other proposed plans or developments not allowed by currently adopted plans would require additional approvals by local jurisdictions.
Sound Transit remains open to suggestions for minimizing impacts and providing mitigation. It will also continue to explore ways to reduce impacts through final design and permitting. In conjunction with the

C-038-004

comment letter. Those comments parallel what Thornton Creek Legal Defense Fund would have written.

Please include our comments in the hearing record, and consider them in your administrative review and notify us of any and all meetings, hearings or updates on this proposed project.

We incorporate by reference, our original oral scoping comments at the April 23, 2012 hearing and all of the comment letters received at that time. We also incorporate by reference all documents and comment letters submitted to date on the DEIS process.

Thornton Creek Legal Defense Fund, knowing how important it is to have Stakeholders from all sectors involved for best results, is looking forward to working with the Sound Transit Board and other entities that will be work on the implementation of this planning effort.

Respectfully submitted,

Patricia Sumption, board member,
Thornton Creek Legal Defense Fund
10510 – 11th Avenue NE,
Seattle, WA 98125
206-525-1708

permit processes, Sound Transit will provide further opportunities to involve the public, including interested parties such as the TCLDF.

C-038-004

Please see responses to Paramount Park Neighborhood Group's comments C-033-001 through C-033-024.

Transportation Choices
transit for all

September 23, 2013

Lauren Swift, Lynnwood Link Extension DEIS
Sound Transit
401 South Jackson Street
Seattle, Washington 9810

Re: Lynnwood Link Extension Draft Environmental Impact Statement Comments

Dear Ms. Swift,

Thank you for this opportunity to comment on the Draft Environmental Impact Statement (DEIS) for the Lynnwood Link Extension.

Transportation Choices Coalition is a statewide nonprofit organization working to bring Washingtonians more and better transportation choices. We view this project and all projects that move light rail farther north as a vital component of the Central Puget Sound's future regional transportation infrastructure, providing a fast, reliable, economically and environmentally sustainable way for our growing population to reach homes, jobs and destinations. The Lynnwood extension will be an economic development engine, dramatically improving access throughout the region and stimulating additional public and private investments in Seattle, Shoreline, Montlake Terrace, Edmonds and Lynnwood. Finally, we hope that the introduction of high-capacity transit will maximize existing, and catalyze new, vibrant neighborhoods and urban centers, thereby creating great places for people to live and work.

In order to achieve these long-term goals, Lynnwood system alignment and station siting decisions must maximize the potential for meaningful Transit-Oriented Development (TOD) throughout the alignment. These vibrant neighborhood and urban centers—providing a complete array of amenities, housing and transportation choices, in proximity to high-capacity transit—have demonstrated countless long-term social and environmental benefits and are a central strategy to accommodating growth in a sustainable manner in our region. In addition, system alignment and station siting decisions must minimize the short-term and long-term environmental and social impacts of construction of the system.

We understand that reduced sales tax revenue and an agency wide shortfall may push you to look at up-front cost saving opportunities in the system design and construction. However these short-term cost saving measures should not compromise the potential benefits of the system by limiting long-term access and ridership of the system. It is imperative that the Lynnwood Link project optimizes access within and between urban centers, as promised in the overwhelmingly approved ST2 package in November 2008.

Based on these considerations, we make the following comments on the DEIS:

219 1st Ave S, Suite 420 | Seattle, WA 98104
p 206.329.2536 | transportationchoices.org

C-039-001

We strongly support Alternative A10 or A11 for Segment A for strong TOD and ridership potential – construction of 3 stations 130th, 145th and 185th

We believe this alternative maxes the ridership and TOD potential of the alternatives analyzed. The capital cost range for three stations instead of two, is lower or comparable, but the ridership and development potential is much greater. There is no compelling reason to choose A1 or A3 and those options should be removed from consideration. Increased ridership and TOD potential will lead to higher cost recovery in the long run and will maximize investment in this corridor. We must get the most out of our regional investments.

C-039-002

We strongly support Alternative B2A for Segment B for strong TOD and ridership potential – construction of two stations, Montlake Terrace Transit Center and 220th Street SW

We believe this alternative maxes out the ridership and TOD potential of the alternatives analyzed. It is imperative to support potential TOD in Mountlake Terrace's planned town center, by locating the stations east of I-5.

In closing, we believe the Lynnwood Extension, if well-designed to promote access and choices, will help achieve our region's and state's growth management and environmental requirements while generating economic development and supporting great places for people to live and work. As our region continues to grow in population and employment, moving between urban centers in a socially and environmentally sustainable manner is critically important.

We commend Sound Transit for the lengthy and comprehensive environmental review of Lynnwood station alternatives. Thank you for this opportunity to comment on the DEIS. Please contact us if we can provide any additional information or assistance.

Sincerely,

Carrie Dolwick

Carrie Dolwick
Policy Director
Transportation Choices Coalition

[illegible] Ave S, Suite 420 | Seattle, WA 98104
[illegible] 206.329.2536 | transportationchoices.org

C-039-001

Your reasons for preferring three stations in Segment A, as featured in Alternatives A10 and A11, are noted. The Preferred Alternative has stations at NE 145th Street and NE 185th Street and considers an option for a 130th Street station.

C-039-002

Your preference for Alternative B2A due to its two stations is noted. The Final EIS considers an option to the Preferred Alternative for a second station.

Sound Transit
Draft EIS Comments c/o Lauren Swift
401 S. Jackson St.,
Seattle, WA 98104

C-040-001

Along with other members of the Washington State Latvian community, I am very concerned about the future of our church and community center because of the impact that the Light Rail extension north to Lynnwood will have on our facility.

We have at the center a library with several thousand volumes of Latvian books and journals. The library serves the entire community: older people who feel the need to read in their native language; younger people who want to learn about Latvian authors and Latvia's history; and children in Latvian school, who are studying the Latvian language and learning about the culture of their parents and grandparents.

The library is a source of reading material for our Latvian Book Club, which meets regularly throughout the year. By donating not insubstantial sums to the Baltic Studies fund each time we meet, the Book Club supports the Baltic Studies program in the Scandinavian Department at the University of Washington. UW officials have consistently expressed their gratitude for the great support from the Latvian community.

Each year our Latvian library ships hundreds of books by Latvian authors living in the west to libraries and schools in Latvia. These books were not available, and indeed forbidden, to readers in Latvia during the 50 years of communist occupation.

If we lose the Latvian Center, the library will cease to exist and our community will be deprived of the strong link to its cultural heritage that books provide. We ask you to do everything possible to let us keep the church and center.

Sincerely,

Dr. Vaira Pelekis-Christopher

C-040-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Please see Section 2.5.1 of the Final EIS for a description of the refined Segment A alternatives that avoid displacing the church.

Ann-Marie Petersons
Co-Director
Seattle Latvian School
11710 3rd Ave N
Seattle, WA

September 20, 2013

Sound Transit
C/o Lauren Swift
401 Jackson Street
Seattle, WA 98104

Dear Sound Transit:

C-041-001

On behalf of the Seattle Latvian school students, families and graduates we would like to express our concerns about the Northgate light rail expansion.

The Seattle Latvian School was established in 1950 for the purpose of teaching Latvian language, culture, and history. Since its inception, it has been a significant pillar in the small but active Latvian community in the Pacific Northwest. Hundreds of students have graduated from the school and as adults most students continue to be active participants within the larger community. The effect is that the school has a generational impact on our community. Almost all of the parents of our current students attended our school when they were young.

The Latvian Center and Church has several dedicated classrooms for the school. This enables our teachers to create an immersive cultural environment for our children. It would be very difficult to re-create this environment should we need to look for an alternative location to hold our school.

Our enrollment ranges in size from 25 to 50 students and this fall we will welcome 25-30 pupils. Currently, all of our students are under 9 years of age, although typically we have students from 3 to 14 years old. We are disheartened to think that these children might not have an environment to further their Latvian education as they grow older.

C-041-001

Thank you for your concerns about the potential displacement of the Latvian Evangelical Lutheran Church and for highlighting its significance to the region's Baltic community, including the Seattle Latvian School. The Sound Transit Board directed Sound Transit to explore a Preferred Alternative that would avoid displacing the church. Since the publication of the Draft EIS in June 2013, additional engineering was undertaken to reduce adverse effects on the Latvian Evangelical Lutheran Church property and facilities. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained. Several sections in the environmental document have been updated to address these changes including: Section 2.5.1 describes the refined alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods; Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative.

The church building was evaluated as a noise and vibration-sensitive property, as discussed in section 4.7 Noise and Vibration, and further detailed in the noise and vibration technical report. The technical report details noise levels at the church for existing conditions and for future years with and without the project. Sound Transit is replacing the existing noise wall with a higher noise wall, in part for the church but also to mitigate the residential properties around the church. As a result, there would be no remaining impacts to the church and the outside noise levels are predicted to be similar to existing noise levels.

Construction of the light rail project near the Latvian Evangelical Lutheran Church would take approximately 1 to 2 years. Access to the

C-041-001 We urge the transit commission to work closely with the Latvian and Northgate communities to find a solution that allows continued access to the building and mitigates all impacts so that our School can continue operating successfully. Impacts to the school from the light rail include, but are not limited to, noise coming from the tracks during outdoor time, vibration, and lack of parking in the event any of the alternatives result in reduction in parking. In addition, Sound Transit should plan to relocate the school temporarily during construction since a closure of the school for any period would be disruptive to the children and the education we provide.

While school is primarily on Saturday mornings, we also have several events that are held on weekend evenings with adults and community members are present. If parking is severely limited, this will impact our ability to hold those events.

Thank you in advance for reviewing our school's comments and taking them into consideration when considering this expansion of mass transit.

Sincerely,

Ann-Marie Petersons

church and community center buildings would be maintained during construction, and parking supply would be maintained as much as possible, although, access or parking areas may temporarily shift as the realigned access roadway is developed. During final design and construction planning, and throughout the construction period, Sound Transit will coordinate with the church and the school to minimize impacts on church and cultural center buildings and their related activities and functions.

Senior Services
Promoting the well-being of older adults

September 23, 2013
Sound Transit Draft EIS Comments
c/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

Senior Services was fortunate to be awarded one of the Growing Transit Communities' Equity Grants for the Lynnwood Link Light Rail Planning. We focused on outreach and community organizing with Shoreline residents. Our goal was to create a process to assure that people from communities of color and those living on limited incomes had a voice in Transit Oriented Development.

We organized and held two events in Shoreline this year: one for the Korean Community, which was held in Korean, not English; and one for folks of limited incomes, of which about 20% were also disabled. As the convener, we are not officially representing either of these groups; we are submitting this comment letter to report what people in these groups said they wanted available in the station area when they stepped on or off of the trains in Shoreline. About 100 people attended these two events.

C-042-001

I'm attaching 3 documents: Summary Reports for each of the two events by sub-category, and the detailed comments as listed from each of the discussion tables. Some of the most repeated ideas were:

- Built environment features: water fountains, LEED construction, covered benches and waiting areas, restrooms, drinking fountains, open and green spaces, parks, gardens and pea patches
- Bike lanes and trails connected to stations; bike storage, rentals, zip bikes at stations
- Pedestrian features: sidewalks and trails connected to stations
- ADA Compliance and over-compliance: non-slip diamond plates; Universal Design; extra-wide drop-off zones and platforms; increased ADA parking; vision and hearing impaired signals.
- Parking: disabled, commuter-only, underground, van-pool, mixed use
- Fitness options: sports fields, areas for exercise in the morning, sport courts, a pool, a YMCA
- Safety: well-lit, pleasant, clean, patrolled, safe at night and day, security cameras
- Dense Housing: mixed density with emphasis on low-rise rather than high-rise
- Coffee Shops – High level of request for these!
- Mixed Income Housing – Affordable and subsidized; emphasizing lowest incomes
- Korean Grocery Store; and other ethnic markets
- Art – local, Native, humorous, murals and sculpture

Please understand that we spent several months encouraging these people to engage in this process. It is difficult to assure these voices are at the table when language barriers, physical barriers, and often time and cost constraints in just getting to meetings, can prohibit people from being involved. Please consider this input when planning for the two light rail stations in Shoreline.

Sincerely,

Dori Gillam
Program Manager, Aging Your Way

C-042-001

Sound Transit appreciates receiving these documents from your events. Many of these components are discussed in the Draft EIS. During final design, Sound Transit will work with local jurisdictions and offer opportunities for public involvement as the detailed design of the station continues. The Sound Transit project does not yet define commercial or recreational space in the facilities, although Sound Transit does have a Transit Oriented Development policy as described in Section 4.2 of the Draft EIS, and is open to transit-oriented development partnerships.

Summary of Ideas from TOD Event for the Korean Community

On July 11, 2013 about 60 members from the Korean Community attended an event at the Shoreline Conference Center convened by Senior Services and facilitated by Yun Sook Kim. State Representative Cindy Ryu provided opening remarks and connected Senior Services to the Korean Community. The event was made possible by an Equity Grant from the Growing Transit Communities Project administered by Impact Capital. King County Council Member Rod Dembowski, Shoreline City Council Members Chris Eggen, Chris Roberts and Jesse Salomon attended the event. Successful transit communities are created through inclusive planning and decision making processes, which is why the event was held. Participants were given an opportunity to begin thinking and talking about what kind of community they wanted to live in. Their feedback is organized under the topic areas below.

C-042-002

Bicycle/Walking/Bus Connections

- Bicycle storage that is safe and secure
- Enough parking spaces particularly for commuters
- Accommodation for elders and people with disabilities
- Expanded bus service to connect the community to the station, especially East-West, but also between King and Snohomish
- Bicycle lanes that connect the community to the station
- Able to get to the station by walking or biking
- Circulating shuttles picking up people to take them to the station so they wouldn't have to bring their car; stopping at shops, the library and other popular destinations along the way
- Places to visit by foot that are near the station where people can shop, fitness center, grab coffee or a snack

C-042-002

Thank you for the suggestions on transit service and access features for the stations. As described in the EIS, Sound Transit developed preliminary station access plans in coordination with King County Metro, Community Transit, WSDOT and the local jurisdictions. This included a transit integration plan addressing potential changes to transit service to serve the stations. However, specific changes to routes and services would be made by each of the local transit agencies in a public planning process that would occur prior to system opening. Each of the stations include pedestrian and bicycle access features, and where streets are altered or reconstructed for the project, bicycle and pedestrian facilities are included consistent with local jurisdictional plans and standards.

C-042-003

Housing

- Senior Apartments with a green roof that includes vegetable garden
- Residential and commercial mixed use development
- More subsidized apartments
- Apartments in addition to what is mostly single family houses in Shoreline

C-042-004

Recreation/Community Services/Schools

- Sports fields and built environment that supports physical activity
- Exercise in the morning before heading to work; Fitness equipment for all to use
- Open space with water fountain or water feature
- Arts, dances, galleries
- Senior Center for Korean Elders
- Park and Playground

Businesses and Jobs

- Places for students, book stores, coffee shops
- Wedding venue
- Cultural center or concert venue
- Cafés where you can get breakfast before you head to work
- Flea market
- Food vendors and food trucks, especially in the morning
- Traditional Korean Tea House look for the station-roof tiled with Korean tiles
- Large Korean Grocery Market
- Gallery/Museum
- Business center/Internet Cafe near the station for business or personal use
- Day care center for parents to drop their children off before they go to work
- Drug store
- Job opportunities that allow people to work in Shoreline

Other

C-042-005

- Need to feel safe coming and going from the station at all hours; Security cameras to keep it safe; Clean and pleasant environment

C-042-006

- 155th station location not favored; no freeway exit; too "narrow"

C-042-007

- Expand light rail to Everett

Next Steps

- Get involved with the 185th Station Area Citizens Committee. For more info visit http://be.futurewise.org/content_item/Shoreline185
- Participate in events organized by the City of Shoreline. For a list of events visit www.shorelinewa.gov/lightrail
- Questions about this report: contact Joanne Donohue at Senior Services joanned@seniorservices.org or 206 727-6206

C-042-003

Thank you for your comment on the need for additional housing choices in the city of Shoreline. Although the zoning designations at the time of the Draft EIS did not permit multi-family or mixed-use development near any proposed light rail station, the City of Shoreline has since been conducting subarea planning and environmental review for the NE 185th Street Station area. The plan changes and related zoning could accommodate higher density residential and commercial mixed-use developments and apartments surrounding the light rail station area, and this would help to improve access to transit for populations that may not own automobiles. While the City's plan and any rezoning is an action of the City of Shoreline, it is evaluated as an indirect impact of the Lynnwood Link Extension project, which would develop a station within the city's action area; see Section 4.2.4 for details.

C-042-004

Thank you for your suggestions regarding possible amenities and businesses that could be associated with light rail facilities. Section 4.2.4 in the Land Use section of Chapter 4 of the Final EIS discusses Sound Transit's transit-oriented development program, as well as the transit-oriented development potential for each of this project's proposed station areas.

C-042-005

The stations are well lit, are continually monitored by security cameras, and are regularly monitored by security personnel. Sound Transit would implement a number of measures to deter crime in the station areas. Measures to minimize crime would include the use of equipment (e.g., closed-circuit TV [CCTV], sealed fare boxes, and automatically sealed exits), the use of anti-crime programs such as anti-graffiti programs, and the use of security personnel. See Section 4.14 - Public Services, Safety, and Security.

Summary Report from Shoreline Light Rail Event
Folks of Modest Means
August 7, 2013

On August 7, 2013 over 50 people of limited incomes including representatives from agencies that serve them attended an event at Prince of Peace Lutheran Church convened by Senior Services and facilitated by Dori Gillam. Deputy Mayor, Chris Eggen provided opening remarks with a special welcome from Kevin Osborn of Hopelink. The event was made possible by an Equity Grant from the Growing Transit Communities Project administered by Impact Capital. Shoreline City Council Member Jesse Salomon also attended the event. Successful transit communities are created through inclusive planning and decision making processes, which is why the event was held. Participants engaged in conversation about, and envisioned, the kind of community they want to live in, specifically, the amenities and services they would like to see at or near the Light Rail Stations in Shoreline. This is the first time people of more modest means have been organized to provide input to such a long-range and large-scale project. A summary of their feedback is organized under the topic areas below.

C-042-008

Transportation/Mobility

- Bicycle storage that is safe and secure
- Parking spaces for commuters only (keep them out of neighborhoods)
- Disabled parking and drop-off zones, and larger parking spaces
- Accommodations for: elders and people with disabilities; families with strollers; travelers with luggage
- Expanded bus service to connect with the station, especially East-West
- Full-service transit hub for trains, bus, bike, shuttles, walking; Orca card station
- Bicycle lanes and trails connecting community to the station
- Bicycle rentals including 3-wheeled bikes, zip bikes
- Safe, ADA compliant wide walking paths, sidewalks and cutouts (non-slip)
- Circulating shuttles that loop to the station, shops, library, grocery stores, etc.

C-042-009

Housing

- Housing with variety: for seniors; families with small children; pet-owners; immigrants; students; both subsidized and affordable; all ADA compliant
- Residential and commercial mixed-use development
- High number of subsidized units and low income vs. affordable

C-042-006

Your comment that a station at NE 155th Street is not favored is noted.

C-042-007

Comment noted. Sound Transit has completed a high-capacity transit corridor study from Lynnwood to Everett as part of the Long-Range Plan Update and ST 3 planning. See http://www.soundtransit.org/Projects-and-Plans/Long-range-Plan-update

C-042-008

Sound Transit light rail stations will have racks and/or lockers for bikes. The project includes bicycle and pedestrian access facilities at station areas and reconstructed streets, but longer routes or trails to the station area are not currently defined as part of the Lynnwood project. Sound Transit does not operate bike rental enterprises. Parking spaces would be provided at each of the station locations included in the Preferred Alternative. Stations and parking structures will be ADA-compliant, so they will accommodate people with disabilities, elders, and others. Sound Transit will work with local transit agencies and the cities to coordinate transit services to stations, but any changes to routes and services would be made by King County Metro or Community Transit, the local transit agencies.

C-042-009

Please see the response to comment C-042-003.

C-042-009

- LEED and other environmental friendly and sustainable housing
- Mixed density and type: low-rise, townhouses/condos, owned and rentals
- Layer-cake or stair-stepped skyline; departure from current SL style

C-042-010

Recreation/Community Services

- Fitness facilities, exercise area, courts
- Open spaces with water fountain or water feature and drinking fountains
- Art, especially local artists and native American, humorous, interactive art, murals
- Music venue
- Maintain current Senior Center and Community Center
- Park, pocket parks, playgrounds
- Small education/community commons with meeting spaces, library
- Community gardens or P-Patches, green spaces, picnic areas
- Dog park; skate park
- Social Services, Food bank, meal programs, DSHS

Jobs and Businesses

- Delis, coffee shops, bakeries, cafés, ethnic foods, bar
- Grocery stores, mini-marts; local or mom and pop; drug store
- Internet café, wi-fi, charging stations, small office space, copy and postal substation
- Bike shop and auto shop
- Pet care and child care
- Food carts and vendors
- Artist lofts
- Gym
- Dental/Healthcare/Urgent Care
- Affordable business sites

Other

C-042-011

- Safety/security by day and night; security cameras, clean, well-lit, bicycle patrolled
- Ample restrooms at and near the stations

C-042-012

- Maximum noise abatement

C-042-013

- 155th station not favored; must rebuilt all of 145th anyway

C-042-014

- Emphasis on locally-owned over chains
- Community reader boards
- Green and ADA construction for anything new built at or near the station
- Sound signals for visually impaired
- Covered areas, plenty of covered and uncovered benches at and near the station

Next Steps:

- Get involved with the 185th Station Area Citizens Committee: http://be.futurewise.org/content_item/Shoreline185
- Participate in events organized by the City of Shoreline: www.shorelinewa.gov/lightrail
- Questions about this report? Contact Dori Gillam at dorig@seniorservices.org or (206) 268-6737

C-042-010

Please see response to comment C-042-004.

C-042-011

Sound Transit designs and maintains its stations to be safe, secure and clean. The stations are well lit, feature security cameras, and are regularly monitored by security personnel. Crime is not expected to increase as a result of operation of the stations. Several studies have concluded that crime around stations mirrors crime rates in the surrounding neighborhoods. Most areas in the project corridor have low crime rates. Sound Transit would implement a number of measures to deter crime in the station areas. Measures to minimize crime would include the use of equipment (e.g., closed-circuit TV [CCTV], sealed fare boxes, and automatically sealed exits), the use of anti-crime programs such as anti-graffiti programs, and the use of security personnel. 2010 crime statistics related to already built Sound Transit facilities show that the crime rate per number of riders at transit facilities and on light rail and commuter rail trains is substantially lower compared to overall per capita crime rates in Seattle, Tukwila, and SeaTac.

Based on a system-wide policy adopted by the Sound Transit Board, Sound Transit stations generally do not include public restrooms, partly for health and safety/security reasons.

C-042-012

The noise analysis for the Lynnwood Link uses the FTA and local code impact criteria and Sound Transit mitigates noise impacts to levels below the criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Sound Transit
Draft DEIS Comments c/o Lauren Swift
401 Jackson Street
Seattle, WA 98104

Re: Lynnwood Link Extension DEIS

The Estonian American National Council (EANC) is the nationally-elected central organization of Estonian Americans. We help support Estonian American institutions and activities throughout the United States.

Estonian Americans in the greater Seattle area have informed us about the Lynnwood Link Extension DEIS and that all the alternatives presented severely impact the Latvian Church and Community Center. The Estonian Community in the greater Seattle area uses this space for the Estonian Church as well as for all of the Estonian community celebrations. Any disruption to its availability, whether temporary or permanent, will prohibit their ability to hold church services and gatherings.

it is imperative that all construction related impacts to the Center be mitigated in a manner which allows the Estonian American community's continued use of this facility during construction, and that long term impact resulting from the operation of the light rail system be mitigated in a manner allowing their continued use of this facility .

Thank you,

Linda Rink
Executive Director

Founded in 1952, the Estonian American National Council, Inc. is a nationally elected 501(c)(3) nonprofit organization representing the interests of Estonian Americans both in the United States and Estonia, and dedicated to preserving and sustaining their heritage.

C-043-001

Thank you for your comments describing the importance of the Latvian Evangelical Lutheran Church and community center to the Estonian community. See Section 2.5.1 for a description of the refined Segment A alternatives with reduced impacts on the church. Under all alternatives, the project now avoids the potential displacement of the church or community center.

During project construction, the Latvian Evangelical Lutheran Church and center would experience temporary effects from construction, but coordination and mitigation by Sound Transit would allow normal church and cultural center activities to continue. Construction would be ongoing for 1-2 years in proximity to the church. Construction would occur predominantly during weekdays between about 8 am and 6 pm, though evening and weekend construction may occasionally be required. In addition to truck traffic and temporary changes in access routes in the area, other effects such as noise, dust, light, and glare are described in Sections 3.3, 4.5.3, 4.6.4, and 4.7.4; mitigation is outlined in Sections 3.6, 4.5.6, 4.6.7, and 4.7.7. Longer term, mitigation with noise walls would avoid long-term noise impacts for the Latvian Evangelical Lutheran Church or community center, as discussed in Section 4.7.3, with mitigation measures in Section 4.7.7.

The Honorable Pat McCarthy
Chair, Sound Transit Board of Directors
Pierce County
County-City Building
930 Tacoma Ave. S, Room 737
Tacoma, WA 98402

Re: Preferred alternative for Lynnwood Link Extension light rail station locations

Dear Chair McCarthy,

C-044-001

I write to you today with regards to the Lynnwood Link Extension Draft Environmental Impact Statement (DEIS). It is our understanding that the Sound Transit Board will be identifying a preferred alternative in October. On behalf of the Sound Cities Association Board of Directors, we urge the Sound Transit Board of Directors to support the City of Shoreline's preferred alternative for Lynnwood Link Extension light rail station locations at NE 145th Street and NE 185th Street.

As you know, the Sound Cities Association (formerly the Suburban Cities Association) was founded in the 1970s to help cities in King County act locally and partner regionally to create vital, livable communities through advocacy, education, leadership, mutual support, and networking. Collectively, our 35 member cities represent nearly one million constituents in King County.

C-044-002

At our meeting earlier this month, our Board of Directors unanimously adopted a position of support for the City of Shoreline's preferred alternative for Lynnwood Link Extension light rail station locations at NE 145th Street and NE 185th Street. A NE 145th street station would provide better connections throughout the region, is more closely aligned with Shoreline's long term planning goals, and would prevent negative traffic impacts on Shoreline residents.

This matter was discussed extensively at two meetings of our Public Issues Committee (PIC). Our members expressed support for this station location on a variety of factors including the fact that there would be no freeway access to a NE 155th Street station. Locating the station at this alternate location would require a high volume of commuters to drive through Shoreline neighborhoods, and would have a substantial negative impact on Shoreline residents. Conversely, locating the station at NE 145th Street will better serve commuters from neighboring jurisdictions including north Seattle, Lake Forest Park, Kenmore, Bothell, and Woodinville. Finally, where, as here, there is no substantive difference between the two proposed locations, our members believe that Sound Transit should give deference to the City hosting the proposed station, and its long term planning goals.

We thank you for your consideration. If you have any questions, please contact our Executive Director Deanna Dawson at (206) 433-7170, or Deanna@Soundcities.org.

Sincerely,

Denis Law

Mayor Denis Law
President, Sound Cities Association

Cc: Sound Transit Board of Directors
Keith McGlashan, Mayor, City of Shoreline
Sound Cities Association Board of Directors
Sound Cities Association Public Issues Committee

C-044-001

Your support for alternatives with stations at NE 145th Street and NE 185th Street is noted.

C-044-002

Thank you for your comments in support of stations at NE 145th Street and NE 185th Street.

Dear Mr. Iwata and Sound Transit Board:

This letter provides comments on the Link Extension DEIS, Chapter 4.8 Ecosystem Resources 4-147, July 2013, on behalf of the Friends of Jackson Park Trail. FOJPT is a community group that formed to establish a walking trail around the City-owned Jackson Park Golf Course. The trail opened this year and is already very popular with locals and people from further afield. Our group hopes to not only work with the City of Seattle to maintain the trail but to protect the healthy forested areas and restore impacted public lands the trail passes through. Currently, significant parts of the trail pass ivy-choked trees and thickets of blackberry, knotweed, holly, laurel and other invasive species that diminish the trail's appeal to humans and wildlife.

C-045-001 We understand that possible mitigation sites for the Lynnwood Link extension include an area east of 5th Ave NE and adjacent to Jackson Park Golf Course, particularly along North Branch Thornton Creek,

C-045-002 where wetland and riparian mitigation could be constructed. As long as access to and along the trail is not reduced, such a project would be very welcome! In addition to benefiting Thornton Creek water quality and habitat, it would greatly enhance trail users' experience and could help prompt and leverage work along other trail segments. Native trees and other vegetation along 5th NE could screen the trail from the visual and auditory impacts of I-5. We are currently starting our work to develop a plan for improvements. We would appreciate it if you would keep us informed of the status of mitigation plans so we can coordinate with you about the work, should this mitigation option be selected (please use my email: us_chickens@earthlink.net).

C-045-003 We understand that, while not mentioned in the DEIS, two properties are available in Shoreline just north of NE 145th St, the trail's northern border (tax ID 663290-0591and 663290-0830). While the Jackson Park trail is south of NE 145th St, a heavily used traffic corridor, the trees and undeveloped areas on the north side of NE 145th provide a green window that somewhat eases the impact on trail users of this busy street. It seems inevitable that changes in transit and related development near I-5 will bring even more people to the area, people who will need natural areas to provide visual and auditory relief. Preserving wetlands and green spaces in this area is a cost effective way to reduce the inevitable impacts of development, provide for public enjoyment of natural areas and open spaces that attracted so many of us to this area, and would support migrating birds, a specific mitigation need discussed in the DEIS.

C-045-004 Finally, the undeveloped areas north and south of NE 145th were once connected and perhaps in the future they can be again, if these undeveloped properties are preserved. We support Shoreline's efforts to purchase both properties to preserve wetlands and green space near Paramount Park.

C-045-005 Finally, we want to echo several points made by the Thornton Creek Alliance.

- Keeping mitigation in the watershed is important, given the totality of changes likely as a result of the Link Extension.
- Contiguous or proximal projects should be sought to maximize the ecological function of each.
- Planting three native trees for every tree removed for the transit project will help reduce impacts on migratory birds.

C-045-001

The Final EIS and the Ecosystems Technical Report provides further information on the impacted wetland areas and potential mitigation, based on current conceptual designs used for the EIS and other measures defined for the Preferred Alternative. Further details on the mitigation, including mitigation sites, would be developed by Sound Transit during final design and permitting stages for the project. Local jurisdiction and resource agency permitting processes will also provide further opportunities for public review and input by interested parties.

C-045-002

Thank you for sharing your thoughts on the potential benefits of developing mitigation in the Jackson Park Golf Course/Thornton Creek area. The project's design and permitting process would include extensive coordination between Sound Transit and city agencies with responsibility for issuing permits and approvals, but would also have opportunities for coordination with other interested parties.

C-045-003

Thank you for your comment and the suggestion on two sites/properties for mitigation.

C-045-004

Your comment supporting wetland and green space preservation with these properties is noted.

C-045-005

If project-specific mitigation is developed for this project, site selection would emphasize a watershed approach. Plans would be developed in cooperation with resource agencies. This project will follow all applicable federal, state, and local environmental laws and regulations, including tree protection standards and tree replacement ratios.

Thank you for considering our comments.

Lauren Smith
Sound Transit Board
Union Station
401 S Jackson St
Seattle, WA 98104

Dear Ms. Smith and Sound Transit Board:

Please accept the enclosed comments from Thornton Creek Alliance (TCA) on the Draft Environmental Impact Statement for the Lynnwood Link Extension.

TCA's focus is restoring the ecological balance to the Thornton Creek Watershed. In our view, any major infrastructure project in the watershed, such as ST's rail extension, has a vital obligation to improve that balance that has been so heavily weighted against natural systems over the last 100-plus years.

Please make TCA a "party of record" for all matters relating to Lynnwood Link and include these comments in the hearing record and consider them during administrative review.

If you have any questions about TCA's comments, please don't hesitate to contact me at the address above, or 206-365-8965, or ruthalice@comcast.net.

Thank you for your consideration.

Sincerely,

Ruth Williams, President

Enclosure

Seattle Mayor

TCA is an all-volunteer grassroots, nonprofit organization of 115 members dedicated to preserving and restoring an ecological balance throughout the Thornton Creek watershed. Our goal is to benefit the watershed by encouraging individuals, groups, schools, businesses, and government to work together in addressing the environmental restoration of the creek system including: water quality, stabilization of water flow, flood prevention, and habitat improvement through education, collaboration, and community involvement.

Comments on Lynnwood Link Extension Draft Environmental Impact Statement (DEIS)

C-046-001 Thornton Creek Alliance (TCA) applauds Sound Transit's (ST) mitigation policy "to avoid impacts on environmentally sensitive resources as much as possible" (Section 4.8.6, page 4-145). As the DEIS acknowledges, the impacts of the Lynnwood Link Extension would be accumulative and amplified by increases in traffic and density. Therefore it is imperative that ST goes beyond no net loss and move to improvement, restoration, and repair the ecosystem Lynnwood Link transects. To that end TCA advocates a number of actions and or recalculations in the DEIS:

- Look upstream 200 feet and 500 downstream in calculating impact areas

C-046-002
- What does Sound Transit understand to be adequate buffer width for wetlands? Impacted Buffers noted in Table 4.8-3 are quite low for the headwaters wetland complex that is the North Branch, but are stated only in terms of area, with no wetland area defined for comparative purposes. The total area impacted should be re-calculated to using increased buffers on all wetlands and riparian areas

C-046-003 All alternatives should be judged by not only by their impacts but also by the opportunities they provide to improve the ecosystem of Thornton Creek. Note that the City of Shoreline has determined that the watershed ecosystems should be left in better condition at the completion of this project than they are today. Furthermore, Thornton Creek aquatic and habitat connectivity is improving with court mandated culvert removals, citizen initiated barrier removal and Shoreline and Seattle City projects that re-establish wetland, riparian and even hyporheic connections. Instead of minimizing the value of what is present as the current DEIS does in numerous places, ST's Lynnwood Link Extension should acknowledge and seek to enhance potential to repair the largest watershed of Seattle and Shoreline. For example, added value should be given to any option that includes or encourages:

- Daylighting the creek where the rail right-of-way crosses or parallels the creek
- Replaces buried culverts with open channels and "bottomless" box culverts
- Restores instream, hyporheic, and riparian habitat
- Enhances the current north/south corridor of vegetation along I-5 using native plants

C-046-004 We appreciate that the project will construct sedimentation ponds and implement appropriate stream protection methods. With regard to impervious surfaces, what steps will be taken to decrease or keep them to a minimum? Paragraph 4.9.4, states that with increased density around the stations, there will be fewer vehicle trips in the area. This may be so, but there will certainly be many more vehicle trips in the immediate neighborhood of each station. The neighborhoods and the watershed need protection from this vehicle traffic and its associated impact. Spell out and evaluate the mitigations in each alternative. Also, if Northgate is any guide, greater density brings more pets, most obviously dogs, which need an outdoor area well away from sensitive forest/wetland areas.

C-046-001

The study area and methodology defined for the Lynnwood Link Extension project were reviewed by resource agencies and local jurisdictions. Sound Transit looked further than the area of direct impact for the Affected Environment.

C-046-002

This project will comply with all local critical area codes, including prescribed buffer widths within each local jurisdiction. See Section 4.8 - Ecosystem Resources in the Final EIS for current wetland impact information.

C-046-003

None of the alternatives would entail in-water work in Thornton Creek; therefore, Sound Transit does not have any plans to daylight the stream or replace culverts. Sound Transit designs would also avoid conflicts with anticipated fish habitat restoration projects, such as those on the state's fish passage project list. For example, where I-5 culvert replacements are anticipated, Sound Transit could design bridges or box culverts for the guideway to accommodate future restored stream channels.

C-046-004

This project will abide by all applicable federal, state, and local environmental laws and regulations. Minimization of impervious surfaces is a priority for Sound Transit in consideration not only of ecological factors, but also capital costs and long-term maintenance. As stated in the Draft EIS Section 4.9.2, Sound Transit is evaluating measures to control risks to water quality that include minimizing impervious footprints, avoiding the placement of project elements in or near water resources where possible, and installing appropriate surface water management facilities. Sound Transit is also evaluating potential cumulative impacts of growth in the surrounding area, considering that

Thornton Creek Alliance
P.O. Box 25690
Seattle, WA 98165-1190

C-046-005 In consideration of any mitigation, *the guiding principle must be to locate to those projects the watershed where the impacts occur.*

As noted in the DEIS, project area ecosystems are already degraded. We need to do what we can to restore them by keeping those compensatory mitigation funds here where they are badly needed and further damage is about to occur.

C-046-006 Page 4-146 states that measures will be taken to reduce impacts on migratory birds. One perfect measure, which would also reduce air pollution, would be to replace all removed trees with native ones, at a 3-1 ratio, and maintain them for three years, as we requested in our comments prior to this DEIS. It will be beneficial for many reasons to organize projects so that they are contiguous, or nearly so, with other eco-functional sites.

C-046-007 Page 4-147 suggests possible mitigation projects. The proposed project at Jackson Park and NE 5th Ave. would be a beneficial addition to the watershed system. We were quite surprised, however, at the contents of the paragraph on City of Seattle/SPU proposed projects. The first one, in the area of the confluence, is already funded by the City of Seattle. The second one, in Beaver Pond Natural Area, also is already funded by an Opportunity Fund grant (2008 Seattle Parks and Green Spaces Levy) sponsored by TCA! (http://www.seattle.gov/parks/projects/thornton_creek/naturalize_northgate.htm)

C-046-008 We would like to suggest assistance with two property acquisitions that would add a great deal to habitat development and human enjoyment of the urban forest. Both properties are for sale, under threat of development, and contain wetlands. They both abut Paramount Park in Shoreline, which contains what may be the largest remaining wetland in the watershed, and one is directly across NE 145th from Seattle's Jackson Park Golf Course with its new walking trail and beautiful artwork.

Here are the details on the two critical properties:

663290-0591 – Legal: PARAMOUNT PARK DIV #2 S 1/2 LOT 3 LESS E 148 FT THOF & LESS 23 FT THOF TGW POR LOT 2 LESS E 148 FT THOF & LESS S 37.5 FT THOF - AKA - PCL B SHORELINE LLA #SHLA-97-023 REC #9802231408

The King County web site is remiss in not describing this lot as a wetland. There are wetland plants and water everywhere you look, also many trees. This lot has never been developed. Locally it is referred to as the 'Kim Property', after some former owners. The price is something like $160,000, but please verify. Additionally, we understand that the City of Shoreline is hoping to find the funds to purchase this property as an addition to Paramount Park.

2 of 3

new developments would also be required to implement required stormwater best management practices.

C-046-005

Locating mitigation within the watershed impacted is a priority for Sound Transit. Federal, state, and local regulations may require Sound Transit to mitigate impacts on wetlands and buffers using an approved mitigation bank (if available in the future), King County in-lieu fee program, or project-specific mitigation developed by Sound Transit. If project-specific mitigation is developed for this project, site selection would emphasize a watershed approach.

C-046-006

This project will abide by all applicable federal, state, and local environmental laws and regulations, including tree protection standards and tree replacement ratios. Contiguous or proximal projects will be considered in wetland, stream, and buffer mitigation site selection.

C-046-007

Since the review of potential mitigation sites for the Draft EIS, these sites are no longer available. Both are scheduled for construction in 2014. The sites will be removed from Sound Transit's review of potential sites under consideration for project-specific mitigation.

C-046-008

Thank you for the suggestion on two other sites/properties. These have been added to list of properties considered for mitigation sites.

Thornton Creek Alliance
P.O. Box 25690
Seattle, WA 98165-1190

C-046-008

663290-0830 – Legal: PARAMOUNT PARK DIV #2 – Address: 14521 11th Ave NE. Shoreline, WA 98155

This property is listed as a wetland on the Army Corps of Engineers map. It is largely covered in mixed forest. If this property were to be acquired as an addition to Paramount Park it would preserve a great deal of habitat, as well as provide a wonderful pedestrian corridor from the park to NE 145th. Conversely, should it be developed with five or six homes, ingress and egress would be on NE 145th, adding to the significant problems this highway already poses for Sound Transit traffic. The asking price is $495,000.

Additional Comments:

C-046-009

Table 4.8-1: In the North Fork of Thornton Creek, coho, Chinook (listed as threatened) and sockeye salmon have also been observed. TCA suggests you contact Seattle Public Utilities for more information. Barriers downstream of the study area have been an issue so these species may not be found in the headwaters near the rail study area, but water quality impacts could affect them nonetheless. And, as mentioned, some of the barriers have been removed and more will likely be removed in the future, allowing fish access to the rail study area.

C-046-010

Page 4-134: paragraph following Table 4.8-2: Bald eagles, while no longer listed under the Endangered Species Act, are protected under the Federal Bald and Golden Eagle Protection Act (BGEPA) as well as the Migratory Bird Treaty Act (MBTA). A number of other migratory bird species and their habitat require consideration under MBTA.

Cc: Seattle City Council, Shoreline City Council, Seattle Mayor

3 of 3

C-046-009

The Ecosystem Resources Technical Report provides additional information on fish species in the North Branch of Thornton Creek, including observations of Chinook, coho, and sockeye salmon. The potential impacts on fish by guideway construction and operation under the light rail alternatives are discussed in Section 4.8.2, Long-term Impacts. Also see the Final EIS Appendix O, the Biological Assessment prepared in support of Endangered Species Act compliance for the project.

C-046-010

The Ecosystem Resources Technical Report provides additional information on the regulations pertinent to this analysis. Compliance with the Migratory Bird Treaty Act is discussed on page 4-146 of the Draft EIS.

Subject: NWS-2011-964 Sound Transit (Lynnwood Link) (UNCLASSIFIED)

Classification: UNCLASSIFIED
Caveats: NONE

Hi Lauren,

F-001-001

We received the box of documents related to the Sound Transit Lynnwood Link Extension project, including:

- Draft EIS
- Transportation Technical Report
- Ecosystems Technical Report
- Historic, Cultural, Archaeological Technical Report
- Noise and Vibration Technical Report

The transmittal cover letter indicated that the box included a copy of "*Executive Summary Lynnwood Link Extension Light Rail Project Draft EIS*", but I did not find that document.

I took a quick look through the Ecosystems Technical Report, and we have no comments at this time.

Since the wetland and stream assessments were conducted primarily at a reconnaissance level of effort, and compensatory mitigation is proposed only on a conceptual basis, we will expect submittal of a formal delineation report and mitigation plan concurrent with the JARPA submittal.

Please let me know if you have any questions.

Suzanne

F-001-001

Thank you for your letter. The Executive Summary is a section of the bound Draft EIS. Thank you for your initial review of the Ecosystems report; several of the alternatives under consideration have wetlands impacts, and the Final EIS includes updated information on the wetlands in the area as well as design refinements that have been made since the Draft EIS. Potential mitigation measures have also been defined in more detail. A wetland delineation report and other materials will be provided as part of the project's Joint Aquatic Resources Permit Application.

Seattle, Washington 98104-2826

Re: Lynnwood Link Extension Draft Environmental Impact Statement
EPA Region 10 Project Number: 11-4128-FTA.

Dear Mr. Drais and Mr. Weinberg:

The U.S. Environmental Protection Agency has reviewed the Lynnwood Link Extension Draft Environmental Impact Statement. We are submitting comments in accordance with our responsibilities under the National Environmental Policy Act and Section 309 of the Clean Air Act. We appreciate this opportunity to participate in the NEPA process.

Sound Transit proposes to expand the regional light rail system north from Seattle to Lynnwood, Washington. The corridor is 8.5 miles long and generally follows I-5 from Northgate in King County to Lynnwood in Snohomish County. Six alternatives are evaluated in Segment A (Seattle to Shoreline); four alternatives in Segment B (Shoreline to Mountlake Terrace); and three alternatives in Segment C (Mountlake Terrace to Lynnwood). Because the Sound Transit Board of Directors will identify a preferred alternative based on information in the Final EIS, the Draft EIS does not identify a preferred alternative.

We commend FTA and Sound Transit for including an array of alternatives, which enable decision makers to avoid impacts to communities and the natural environment to a greater extent. We also appreciate your agencies' continued efforts to refine alternatives to further reduce impacts identified through the NEPA process.

F-003-001 Our overall rating for the Draft EIS is EC-2, Environmental Concerns, Insufficient Information. This is based on our concerns regarding specific alternative alignments within Segments B and C that would result in impacts to aquatic resources and Section 4(f) resources that are avoidable through the selection of other available alternatives. However, we rate most alternatives – specifically the alternatives within Segment A, and Alternatives B1, B4, and C3, as LO, lack of objections. An explanation of these ratings is enclosed for your use and information.

F-003-001

Thank you for your review and comment on the Draft EIS. The northern part of the Preferred Alternative analyzed in the Final EIS is a modification of the Alternative C3 that was discussed in the Draft EIS. Please see the Final EIS for the description of the Preferred Alternative and its potential effects. Sound Transit has provided responses to your specific comments in the following pages, but to summarize:

a. On the need for a full 404(b)(1) analysis, of the alternatives, please see response to comment 3.

b. On added discussion of Scriber Creek Park impacts, and potential impacts, please see our more detailed response to comment 7; however, the impacts to the park and surrounding wetland complex area for these alternatives were described in notable detail in the Draft EIS in sections 4.4. Social Impacts, 4.5, Visual and Aesthetics (including simulations of alternatives), 4.7 Noise and Vibration, 4.8 Ecosystem Resources, 4.17 Parks and Recreation, and 4.18 Section 4(f). Chapter 7 of the Final EIS describes the public comments received overall, and highlights the many comments opposing alternatives impacting the park and wetlands.

c. The information on Scriber Creek Park has been updated in the Final EIS in Section 4.17 to also note the funding source of the park. Similar information on the other directly impacted park, Ridgecrest Park in Shoreline, has also been included, along with a description of Sound Transit's commitment to meet the requirements of the funding programs where conversion of parkland is involved.

d. On ecological connectivity, please see response to comment 8.

e. On additional detail for the wetlands and ecological impacts of the OMSF facility, Sound Transit has since issued a Draft EIS on that project

F-003-001

We recommend that the following information be provided in the final EIS:

- A 404(b)(1) analysis of alternatives, particularly for Segments B and C.
- More complete disclosure of impacts from Alternatives C1 and C2 to describe the effects from construction and operation of the light rail project within Scriber Creek Park and Wetland Complex. For example, consider the change in experience for park users and wildlife with noise and disturbance from passing trains every 4 minutes, the potential for disproportionate impacts to low income, minority, disabled, and transit dependent populations, and the nature of public comments on the alternatives.
- Identification and listing of land purchase funding sources for and any use restrictions applied (such as Native Growth Protection Areas) to parks and natural areas that would be affected by the proposed project, including but not necessarily limited to Scriber Creek, Scriber Creek Park, Scriber Creek wetland complex and associated natural upland areas and buffers.
- Effects on and potential to maintain or restore ecological connectivity in the project area.
- More specific information regarding the impacts that would cumulatively accrue to the natural area habitats, functions, and values, and the community open space and values of Scriber Creek Park and Scriber Creek wetland complex from the potential selection of the Lynnwood alternative for the Sound Transit Light Rail Operations and Maintenance Satellite Facility (OMSF).
- Cost projections that factor in the likely lower mitigation costs associated with Alternative C3 vs. C1 and C2.
- Information regarding the adequacy of parking to meet demand during and after project construction

Our detailed comments and recommendations regarding the proposed project are enclosed. We thank you for the opportunity to participate in the Lynnwood Link Extension project, and are grateful for the site visit, which provided valuable information and insights on the project alternatives. If you have questions or would like to discuss these comments, please contact me at (206) 553-1601 or by electronic mail at reichgott.christine@epa.gov, or you may contact Elaine Somers of my staff at (206) 553-2966 or by electronic mail at somers.elaine@epa.gov.

Sincerely,

Christine B. Reichgott, Manager
Environmental Review and Sediment Management Unit

Enclosures

2

that incorporated the Lynnwood Project impact estimates, and Sound Transit is now completing a Final EIS for the OMSF; the Preferred Alternative for that project is a Bellevue site. The Lynnwood Link Extension Final EIS discussion in Section 4.8 Ecosystems incorporates the findings from the OMSF Draft EIS.

f. Please see response to comment 5.

g. Please see response to comment 13.

U.S. Environmental Protection Agency
Detailed Comments on
Lynnwood Link Extension Draft EIS

F-003-002 **Preferred Alternative Selection**
We have no objections or comments regarding the Segment A alternatives. However, there are a number of prominent issues that inform the selection of a preferred alternative in Segment C, and we discuss one with respect to Segment B. Among these are: impacts to ecosystem/aquatic resources, impacts to Section 4(f) resources, and community/environmental justice impacts. We discuss these aspects in their respective sections below:

F-003-003 **Aquatic Resources**
We appreciate that there are a range of alternatives for each project Segment, which affords the opportunity to avoid impacts to sensitive aquatic resources. The Draft EIS provides information that is usable for a 404(b)(1) analysis, such as the number of acres of wetlands, streams, and buffers that would be affected, but does not attempt to provide a complete 404(b)(1) analysis for the purposes of permitting under Section 404 of the Clean Water Act. The 404(b)(1) analysis would disclose information for the public and decision makers that is vital to selecting a preferred alternative.

Recommendation: Include a 404(b)(1) analysis in the Final EIS.

F-003-004 In Segment C, based on direct and indirect impacts to aquatic resources we would identify Alternative C3 as the environmentally preferred alternative, with Option 1 in the I-5 median as preferred over Option 2 west of I-5. While Alternative C1 has a slightly smaller wetland impact (a difference of 0.1 acre), it would result in other significant and difficult to mitigate impacts, including impacts to Scriber Creek Park and Park users and numerous residential and commercial displacements. Alternative C2 would result in the most direct and indirect wetland impacts to the high value Category II Scriber Creek wetlands through direct habitat loss, fragmentation of the Scriber Creek Wetland Complex, and all associated effects to the plant, animal, and human community of park users.

Recommendation: In Segment C, we support Alternative C3 as the Preferred Alternative.

F-003-005 The discussions regarding cost for the various Segment alignments (p. 5-13) do not appear to include the costs of environmental mitigation for unavoidable impacts, such as, wetland impacts.

F-003-006 In Segment B, Alternatives B1 and B4 have fewer wetland impacts, less impervious surface and resulting water quality impacts, and less cut and fill. Based on these factors, we would expect that either Alternative B1 or B4 could qualify as the Least Environmentally Damaging Alternative for the purposes of 404 permitting.

Recommendation: In Segment B, to minimize impacts to aquatic resources we support Alternative B1 or B4 as the Preferred Alternative.

F-003-007 **Community Impacts, Environmental Justice**
We commend FTA and Sound Transit for integrating the discussion of transportation, property, land use, economics, visual and aesthetic resources, air quality, noise and vibration, parks and recreation

3

F-003-002
Sound Transit appreciates EPA's comments on the alternatives by segment, including EPA's description of impacts that are of concern.

F-003-003
The wetlands analyses in the Draft and Final EIS were based on conceptual engineering. They estimate impacts conservatively without attempting to judge the effectiveness of potential avoidance and minimization measures. Because they are primarily intended to help decision makers compare the impacts of the alternatives, they lack the detail required to support an actual permit application. While the Final EIS analysis is more refined than the Draft EIS, with some field delineations performed, the level of design information and agency coordination on potential avoidance measures that could be incorporated would make a Sec. 404(b)(1) analysis premature. The Final EIS acknowledges the alternatives analysis requirement and also identifies which alternatives would have lower levels of wetlands impacts. If appropriate for the Preferred Alternative, Sound Transit will prepare a 404(b)(1) analysis as part of project permitting, but also anticipates that the impacts for the Preferred Alternative would be below the levels requiring the analysis.

F-003-004
Thank you for identifying the Segment C alternative EPA finds as environmentally preferred. Sound Transit has identified a modified Alternative C3, with an alignment west of I-5, as part of the Preferred Alternative.

F-003-005
The cost estimates presented in Chapter 5 for the alternatives consider the need for environmental mitigation. The estimates apply a risk-based contingency amount because project design is still underway and

F-003-007 resources, and public services in the section on "Social impacts, Community facilities, and Neighborhoods" (p. 4-48). We believe this adds value to the analysis and discussion of impacts in the NEPA document (and recommend that it be done in future analyses).

For example, within the Segment C project area, there is a higher than average population of minority residents (37% vs. 32.7% average for King and Snohomish Counties) and, as stated in the Draft EIS (p. 4-51), the residents within the project corridor are generally less well off than residents in the two-county region. Household income is lower than the regional median (85% of the regional median) and 11.3% live at or below the federal poverty level. An estimated 4% of households are transit-dependent, but 3 neighborhoods (Pinehurst, South Lynnwood, and Lynnwood City Center) have more transit-dependent households (7 to 8%). As further evidence of economic condition, 46% are renter-occupied homes; 54% are owner-occupied.

Lynnwood is a heavily urbanized area with few parks and open spaces to serve a largely disadvantaged population. We believe these conditions should weigh heavily in the selection of a preferred alternative within Segment C. Clearly, Alternative C3 would avoid and minimize residential and business displacements (1 business displacement), and would avoid and minimize impacts to Scriber Creek Park (a Section 4(f) resource) and wetland complex, which, based on citizen response to the proposed alternatives since release of the Draft EIS, is much beloved and of disproportionately high value for the affected community. Our site visit to the Park and wetland complex on 9-16-13 revealed it to be an exceptionally high value wetland and natural area, despite its relatively small size. It clearly serves as a tranquil island amid widespread human development.

Recommendations: Provide information in the Final EIS to disclose and characterize the high ecological and community values of Scriber Creek Park and Wetland Complex. Avoid and minimize impacts to Scriber Creek Park and Wetland Complex and residential and business displacements. Alternative C3 is most effective in both respects.

F-003-008 **Ecological Connectivity**
We agree that long term impacts on ecosystem resources (p. 4-135) may include loss or degradation of terrestrial habitat, including habitat connectivity. The Draft EIS does not provide adequate information about habitat connectivity and the extent to which it exists in the project area and beyond. If there are habitat corridors that are currently providing function in this manner, they should be identified and those functions protected and maintained or potentially enhanced as part of the project, where possible.

Recommendation: Describe the Affected Environment, Environmental Consequences, and possible mitigation for impacts to ecological connectivity for the proposed project.

F-003-009 **Cumulative Effects**
The Draft EIS includes the proposed Lynnwood site for the Light Rail Operations and Maintenance Satellite Facility in the discussion of cumulative effects. This is helpful and appropriate, however, more specific information regarding the location, extent, and nature of the potential impacts from the OMSF should be provided. While a full analysis will occur in a subsequent EIS, it is not possible to determine whether the direct and/or indirect effects of the OMSF Lynnwood site would compromise the integrity of Scriber Creek Park and wetland complex.

4

specifics about the extent and cost of mitigation would be affected by a variety of factors and decisions that would be considered with more advanced design and permitting as the project progresses. Sound Transit understands that the cost of mitigation will vary depending on the alternatives chosen, but believes that the cost ranges used in the Draft EIS accurately convey the potential difference that mitigation could make for the project alternatives.

F-003-006

Thank you for identifying the Segment B alternative EPA finds as environmentally preferred. The Final EIS contains additional information on refinements that Sound Transit has made to Alternative B2 to help reduce some of the ecosystem and water resource effects noted in EPA's comments.

F-003-007

Chapter 7 of the Final EIS describes public comments on the alternatives, including the comments regarding the importance of Scriber Creek Park and the associated wetland complex.

Sound Transit notes EPA's recommendations for Alternative C3, which identified the ability to avoid the park impacts, minimize Scriber Creek wetlands impacts, and reduce other property impacts. The Sound Transit Board selected a modified Alternative C3 as the Preferred Alternative for this segment of the light rail facility, requesting further consideration of other factors that could improve the alternative, including preserving redevelopable lands, improving the connections to the transit center, and minimizing stream and wetland impacts. The importance of the Scriber Creek wetland complex was identified in Ecosystems Technical Report as well as the Ecosystems section the Draft EIS (Section 4.8), but is also discussed in Section 4.4 Social. The Final EIS provides updated discussion of the park and its associated wetlands for all alternatives, as

F-003-009 *Recommendation:* In the Final EIS, provide more information regarding the potential effects of the OMSF Lynnwood site on the Scriber Creek Park and wetland complex.

F-003-010 **Land Use Legal Restrictions**
The Draft EIS states that no parklands were purchased with Land and Water Conservation Funds, and therefore there are no Section 6(f) resources. However, the Draft EIS provides no information regarding the actual source of funding or authorization to designate the project area parks, particularly Scriber Creek Park. Because the Scriber Creek Wetland Complex has been retained thus far, the legal restrictions and requirements relevant to its protection should be fully identified and disclosed. For example, federal, state, and local protections should be discussed and upheld, including any potential Native Growth Protection Areas, mitigation actions, or other designations that may have been established pursuant to past development activities.

Recommendation: In the Final EIS, disclose the above legal requirements and restrictions that apply to Scriber Creek, Scriber Creek Park, and Scriber Creek Wetland Complex.

F-003-011 **Project Cost and Mitigation**
The discussions regarding cost for the various Segment alignments (p. 5-13) do not appear to include the costs of environmental mitigation for unavoidable impacts, such as, wetland impacts. The Drat EIS indicates that Alternative C3 has the shortest guide way length and a slightly higher amount of property acquisition than C2. Because C2 would impact almost an acre of high value Category II wetlands (vs. 0.2 acre for C3), Alternative C2 mitigation costs would be higher than for C3.

Recommendation: Factor mitigation costs into any cost comparisons presented in the EIS.

F-003-012 The Draft EIS states (p. 4-145) that temporary work bridges could be used in extremely sensitive areas, such as the Scriber Creek wetland complex. While extremely sensitive areas should be avoided, for any work that may directly or indirectly affect them, such measures should be applied as needed.

Recommendation: Incorporate Context Sensitive Design, Solutions, and construction practices where and whenever there are highly sensitive resources, and as a routine way of doing business.

F-003-013 **Parking**
The Draft EIS indicates that the Lynnwood Park and Ride is currently at full capacity and that both on- and off-street parking are anticipated to be removed due to the placement of the light rail stations and other project modifications (p. 3-39). While further refinement of parking needs and provision may occur in future phases of the project (p. 3-40), to maximize ridership and availability of transit as a travel option, there needs to be adequate parking.

Recommendations: The amount of parking provided at each station should be further refined to ensure that supply would meet demand. We also encourage efforts to mitigate, i.e., provide some temporary parking, agreements with businesses to use underused lots, shuttle service, etc., the loss of available parking during construction that would affect the Lynnwood Park and Ride.

5

well as information about the Preferred Alternative with the modified Alternative C3.

F-003-008

The Final EIS provides more detail on habitat connectivity in Section 4.8.1, Affected Environment; Section 4.8.2, Long Term Impacts; and Section 4.8.3, Construction Impacts. Habitat connectivity will continue to be considered as part of the mitigation process for avoidance and minimization and included in selection of compensatory mitigation for ecosystem resources. Please note also that the Ecosystems Technical Report has more detailed discussions of connectivity and continuity issues, particularly for stream habitat.

F-003-009

At the time of the publication of this project's Draft EIS, design work and effects analysis for the Operations and Maintenance Satellite Facility (OMSF) project was still underway and details were not available for detailed discussion in this document. However, Sound Transit has augmented the discussion of OMSF cumulative effects in the Final EIS, and notes the higher level of potential effects to the Scriber Creek wetland complex if the Lynnwood Site for the OMSF project were developed. The OMSF Draft EIS was published on May 9, 2014**.**

F-003-010

Sound Transit has reviewed the funding sources used to develop directly impacted parklands and has included in the Final EIS a commitment to meet applicable park land or funding replacement requirements (Section 4.1 Acquisitions and Section 4.17 Parks and Recreation both have updated text). Section 4.8.2 and the Ecosystem Resources Technical Report of the Final EIS also have updated discussions of ecosystems impacts to the complex.

U.S. Environmental Protection Agency Rating System for Draft Environmental Impact Statements Definitions and Follow-Up Action*

Environmental Impact of the Action

LO – Lack of Objections
The U.S. Environmental Protection Agency (EPA) review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC – Environmental Concerns
EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce these impacts.

EO – Environmental Objections
EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no-action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU – Environmentally Unsatisfactory
EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

Adequacy of the Impact Statement

Category 1 – Adequate
EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis of data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2 – Insufficient Information
The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses or discussion should be included in the final EIS.

Category 3 – Inadequate
EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the National Environmental Policy Act and or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

* From EPA Manual 1640 Policy and Procedures for the Review of Federal Actions Impacting the Environment. February, 1987.

6

The large undeveloped parcel directly south of Scriber Creek Park is publicly held, but does not appear to have other protections or designations for those properties other than critical area ordinances and other existing federal, state, and local regulation for streams and wetlands. Additional reviews would be conducted for any property Sound Transit would use for construction and operation of the project, and Sound Transit would satisfy any applicable regulatory or legal requirements.

F-003-011

Please see the response to comment F-003-005.

F-003-012

Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects. The Final EIS includes further measures to minimize impacts and describes mitigation in more detail. For Scriber Creek, Sound Transit's potential mitigation includes temporary work trestles, although final design and permitting would confirm the ultimate approach.

F-003-013

Section 3.2.7 of the Final EIS and Section 5.7 of the Transportation Technical Report includes additional discussion of parking at the Lynnwood station. Section 5.1 of the Transportation Technical Report discusses how ridership estimates reflect the ways riders are expected to access the station; many future riders are expected to take transit, walk or bike, in addition to choosing to park. Sound Transit has also considered options that would increase the parking supply at the

station. However, the provision of parking for transit centers is not made solely on estimates of unconstrained demand for parking, but must factor in local and regional plans and policies, the cost of additional parking, and environmental impacts. In Lynnwood, where the current park-and-ride is already a major hub for transit transfers, Sound Transit anticipates that transit transfers at the station as well as walking and biking will continue to increase in popularity, in keeping with the higher-density developments that Lynnwood anticipates near the station. Finally, Sound Transit identifies mitigation measures to address potential spillover parking that could occur.

United States Department of the Interior

OFFICE OF THE SECRETARY

Electronically Filed

September 27, 2013

Lauren Swift
Sound Transit
401 S. Jackson St.
Seattle, WA 98104

Dear Ms. Swift:

On September 20, 2013, the U.S. Department of the Interior (Department) submitted a letter to you stating that we had no comments to offer regarding the Draft Environmental Impact Statement (DEIS) for the Lynnwood Link Project. Although the comment period for the DEIS has ended, the Department respectfully submits the following comments focused on the Section 6(f) evaluation for the project.

F-004-001 Section 4.18.3 of the DEIS is incorrect in stating that there are no Land and Water Conservation Fund (LWCF) properties within the Project area. There are two LWCF protected parks within the Project area: Twin Ponds in Shoreline (53-00082) and Jack Long in Montlake Terrace (53-00072).

Furthermore, under Alternative A5, Sound Transit has identified that parking at Twin Ponds may be used for light rail purposes. The National Park Service, a component bureau of the Department, would consider this a conversion of recreation use to transportation use, and such a conversion has not been correctly identified in the accompanying Section 6(f) analysis as constituting an impact.

Thank you for the opportunity to review this document. For additional information or assistance with addressing these points in preparing the Final EIS, please contact Ms. Heather Ramsay, Program Officer, State & Local Assistance Programs, Pacific West Region, 909 First Avenue, Seattle, WA 98104 (206) 220-4123. If you have any other questions, please contact me at (503) 326-2489.

Sincerely,

Allison O'Brien

Allison O'Brien
Regional Environmental Officer

F-004-001

Thank you for the additional information on LWCF-funded resources in the project vicinity. Sound Transit has conducted additional reviews of the funding sources used to develop parklands and has included this information in the Final EIS. Sound Transit has also defined measures to avoid the potential for transit-related parking at Twin Ponds Park. Parking for transit purposes is not proposed at the park and signage restricting time periods would be an effective means of preventing unauthorized parking at the park. The project's Preferred Alternative does not include a station at NE 155th Street, which also avoids the potential for such impacts to the park.

AMBASSADOR OF THE REPUBLIC OF LATVIA
2306 MASSACHUSETTS AVENUE, NW, WASHINGTON, DC 20008, USA

Washington D.C.
September 20, 2013
No. 221-912

Sound Transit
Comments c/o Lauren Swift
401 Jackson St.
Seattle, WA 98104

Dear Sir/Madam,

F-005-001

As the Ambassador of the Republic of Latvia to the United States I have been approached by the World Federation of Free Latvians, the American Latvian Association in the United States and the Latvian Community in Seattle regarding the next extension of the Sound Transit system in the Seattle area that might negatively affect the Latvian church and Community Center house in the city, possibly leading to the destruction of the Center.

The Latvian community in Seattle is among the largest and most active Latvian communities in the United States. Their Community Center house possesses an impressive cultural and historic heritage for Latvians living in the US. It would be of great loss to the very vibrant and exceptionally warm US-Latvian relations as well to see that the building might perish because of the extension of the Lynwood Link railway line.

I would like to hope that an alternate solution can be found and this particular property will remain unaffected.

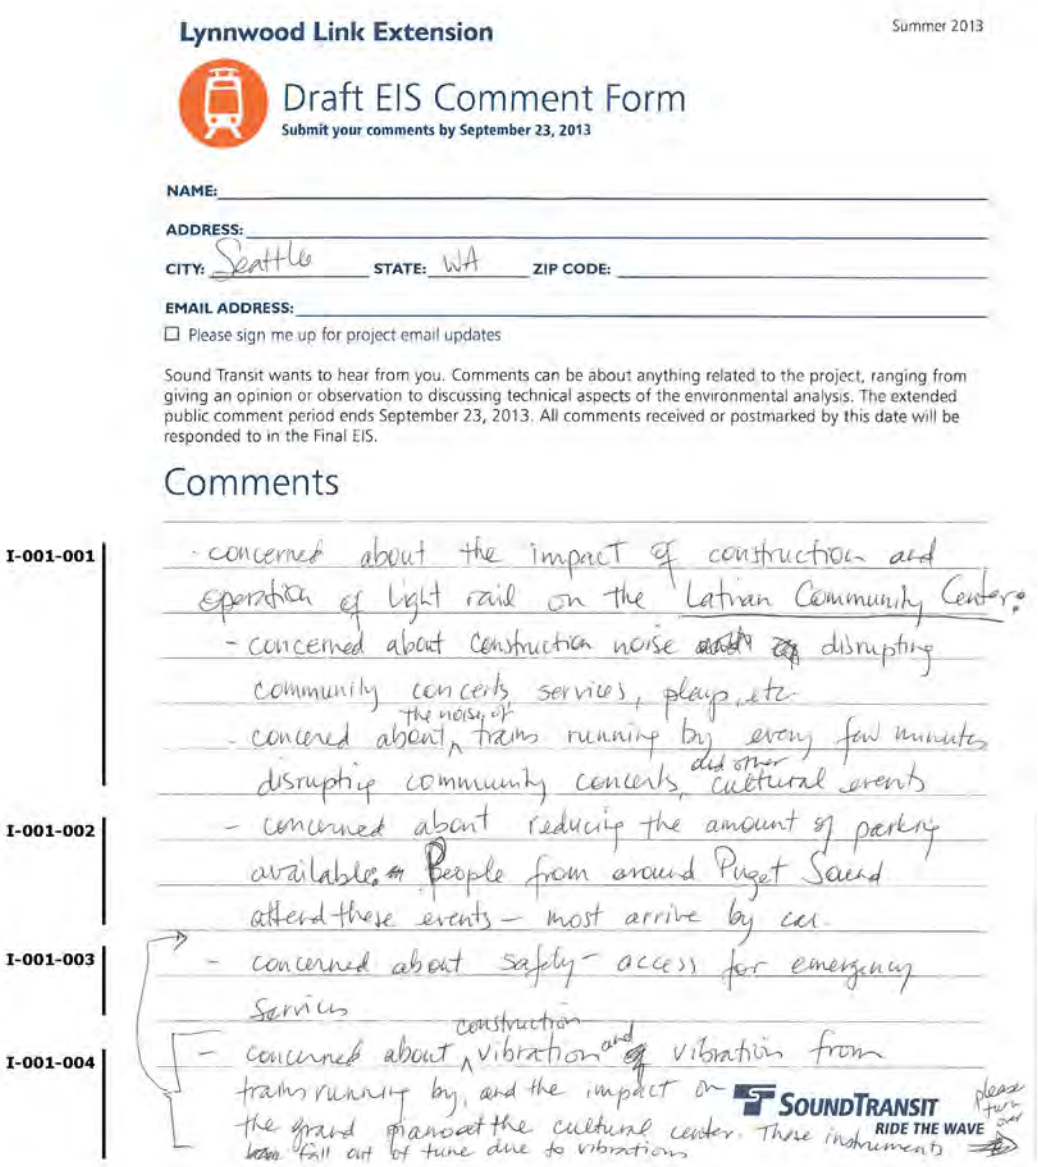
Please give this matter your closest attention.

Yours Sincerely,

Andris Razāns
Ambassador of Latvia in the US

F-005-001

Sound Transit and the Federal Transit Administration appreciate the letter describing your concerns about the potential displacement of the Latvian Evangelical Lutheran Church under the Draft EIS Alternatives A1, 5, and 10 of Sound Transit's Lynnwood Link Extension. Since the publication of the Draft EIS, Sound Transit performed additional engineering that eliminates the need to displace the Latvian Evangelical Lutheran Church. Chapter 2, Alternatives, in the Final EIS describes the refinements, and Section 4.1 describes the acquisition impacts. In addition, compensation would be provided to the church where minor acquisitions of land from the church property would be needed, as required by the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970.



Lynnwood Link Extension

☐ Please sign me up for project email updates

Sound Transit wants to hear from you. Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

I-001-001 - concerned about the impact of construction and operation of light rail on the Latvian Community Center.
- concerned about construction noise disrupting community concerts, services, plays, etc.
- concerned about the noise of trains running by every few minutes disrupting community concerts, and other cultural events

I-001-002 - concerned about reducing the amount of parking available. People from around Puget Sound attend these events – most arrive by car.

I-001-003 - concerned about safety – access for emergency services

I-001-004 - concerned about construction vibration and of vibration from trains running by, and the impact on the grand piano at the cultural center. These instruments have fall out of tune due to vibrations

SOUNDTRANSIT RIDE THE WAVE

please turn over

I-001-001

The noise analysis for the Lynnwood Link Extension uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts according to FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

For construction, the local construction noise ordinance would be applicable, and Sound Transit is committed to maintaining construction noise levels within the criteria. Further, construction noise for this project is similar to construction noise for a paving project, building construction or any other construction project and Sound Transit works with local residences and business to minimize construction impacts.

I-001-002

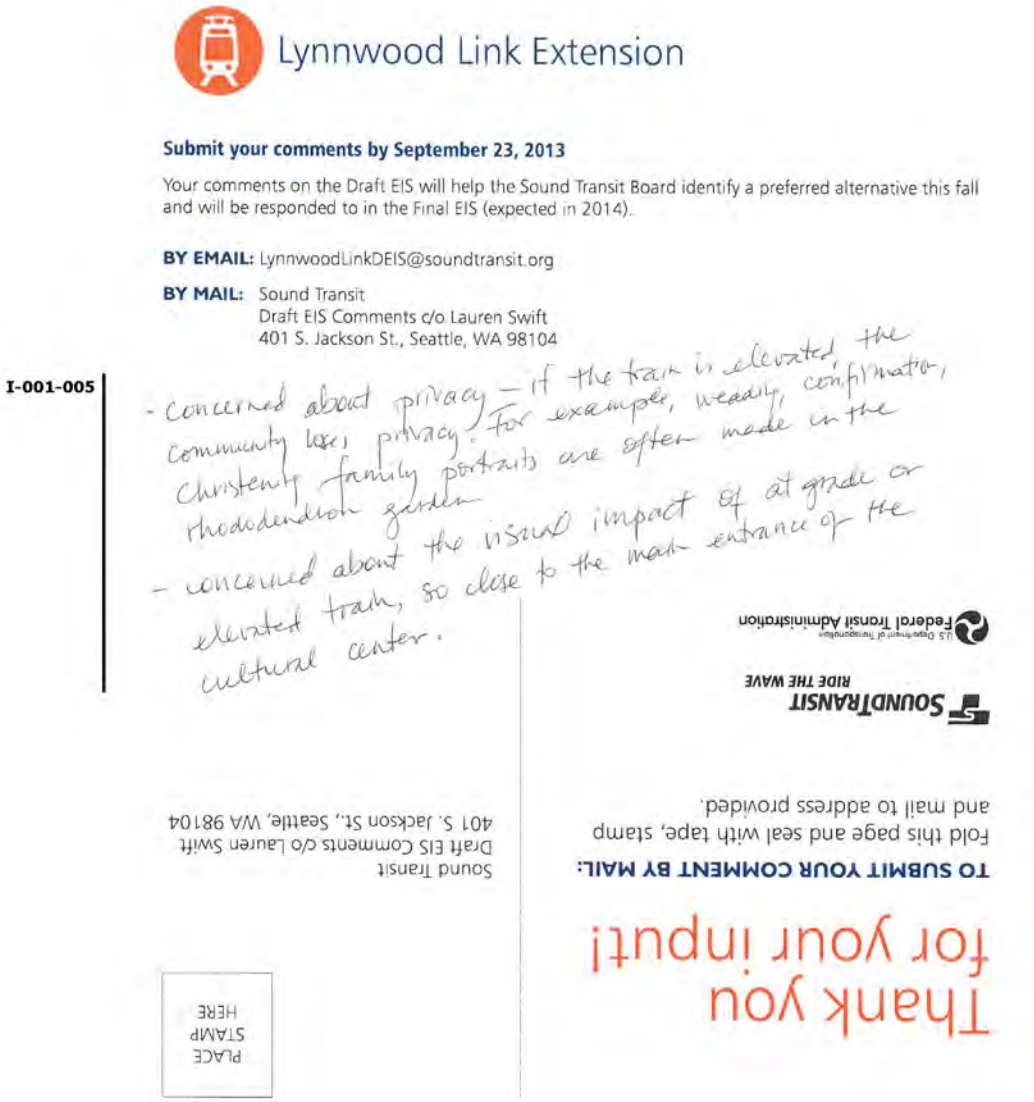
Thank you for your concerns about the potential displacement of the parking for the Latvian Evangelical Lutheran Church. Since the publication of the Draft EIS in July 2013, additional engineering was undertaken to reduce adverse effects on the Latvian Evangelical Lutheran Church property and facilities. As a result, access to the property has been maintained, and the church parking lot would be modified, but parking supply maintained; see Section 3.2.7 in the Final EIS.

I-001-003

Sound Transit will work with local jurisdictions to ensure that emergency services access is maintained to all occupied buildings, both during construction and after light rail begins operation.

I-001-004

Vibration from trains running will not contribute to the piano going out of tune. The vibration from moving trains will be much less than the



Lynnwood Link Extension

Submit your comments by September 23, 2013

Your comments on the Draft EIS will help the Sound Transit Board identify a preferred alternative this fall and will be responded to in the Final EIS (expected in 2014).

vibration generated within the instrument as it is being played. Construction vibration mitigation described in the Final EIS will be implemented during work at the property to minimize the risk of adverse effects at the church property.

I-001-005

It is correct that elevated trains may have views for passengers into adjacent properties, although noise walls, vegetation, and the speed of the trains would make views of individual properties less distinct and fleeting. At-grade trains would be at similar heights to I-5 traffic including buses.

Comments

I-003-001

C3 (close to the freeway) is the best alternative over C1 or C2!
- No wetlands impact
- keep the noise in a "noise corridor"
- close to the interurban trail for access
- easier and less costly access for maintenance
- easier access for safety and emergency vehicles!

Option 2 is the best! keep the bus + rail traffic together.
- Less pedestrian traffic over/through/around the buses!
- Safer + easier to maintain (spelling)
- Makes it a transfer hub like Lafayette plaza
- Makes it easier for transit and commuters.

SOUNDTRANSIT RIDE THE WAVE

I-003-001

Thank you for your comment stating a preference for Alternative C3 over the other two alternatives and for stating a preference for the Option 2 station alternative for an elevated station relocated east of 46th Avenue W. Following the publication of the Draft EIS, Sound Transit continued to work with the City of Lynnwood and others to define a modification to Alternative C3, which is evaluated in the Final EIS as the Preferred Alternative.

TO WHOM IT MAY CONCERN;

I-004-001 | PLEASE SELECT OPTION C-1 FOR THE LINK LIGHT RAIL. I BELIEVE THIS WOULD BE THE BEST SELECTION FOR LYNNWOOD.

THANK YOU,

Ariel Bautista 8-15-13
15411 34th Ave SE
Mill Creek, WA 98012

I-004-001

Thank you for your comment stating a preference for Alternative C1.

Samuel H. Bess
116 NE 158th St.
Shoreline, WA 98155-5720
206-367-0728

I-005-001 Table 4:1-1 Does not identify WHICH "Residential single family" or "Residential multifamily" units are adversely selected
under the segment alternatives Seattle to Shoreline. They should be disclosed publicly.
Shoreline streets (ie. First Ave. NE from NE 156th to Ridgecrest Park) if adversely displaced (or modified)
are not noted specifically. They should be disclosed publicly.

I-005-002 Any infrastructure in the City of Shoreline; fire hydrants, water lines, sewer lines, curbs, gutters, drains should be
upgraded to current code and to fully improved status if projects impinge upon their existence or quality of access.
For example First Ave. NE from 156th to Ridgecrest Park.

I-005-003 Table 4.7-5b My address is directly impacted and rated as moderate to severe noise and vibration "requiring mitigation".

From NE 155th St. to Ridgecrest Park, all residential units along First Ave. NE and up-slope appear to be impacted
according to this table. Historically, since the I-5 opened in the early 60's, noise and vibration have
become an on-going nuisance. twenty years ago, neighbors banded together living then in what was
unincorporated North King County, requested the DOT to mitigate these conditions and address our concerns.
Some sound studies were selectively taken and the DOT refused to take mitigating remedies
along much of First Ave NE between NE 155th and Ridgecrest Park. the main reason stated was that

I-005-001

Thank you for your comment. Table 4.1-1 is a summary of the number of parcels that could potentially be affected by each alternative. Figures I-4.1-1 through I-4.1-4 identify these parcel locations, and Tables I-4.1-1 through I-4.1-3 identify parcel addresses. Streets that would require modification by the Preferred Alternative are identified in the Final EIS.

I-005-002

Permits are required for any Sound Transit Lynnwood Link Extension construction that falls under City of Shoreline jurisdiction, and infrastructure replaced due to such construction will be built to existing codes.

I-005-003

The noise analysis for the project uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts according to FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail noise impacts. In addition, where existing WSDOT noise walls are removed and replaced as part of the project, they will meet the requirements of, and be approved by, WSDOT and FHWA.

Your suggestion for a lid is noted, but sound walls are planned at this location.

I-005-003 almost all residential single family units are built more than 20 feet above First Ave. NE and are foundationally imbedded upon hard-pan geological glacial fill (an excellent vibration transmitter and water conductor.)

I-005-004 How will your proposal to "mitigate" the increased vibrations and noise protect residences 4,5, and 6 up the eastern hill be conducted?

I propose an I-5 Lid from 156th to 162nd St. under which the Light Rail should run. (or a modified cantilever 2/3) West facing deflector to shield higher elevations yielding equal mitigation effects for all residences along that specific corridor.

I-005-005 Table 4.77 Visual quality impacts:

Removal of existing vegetation from NE 155th St. to the North boundary of Ridgecrest park would strip the only sound mitigation available at this time Including numerous conifers and deciduous trees. The ecosystems established in these urban greenways would be destroyed. Critter migrations would be expected. Loss of habitat would be tremendous along miles of green sward DOT right-of-way borders. This habitat would be irreplaceable.

I-005-006 There are sub surface water-courses along this I-5 eastern margin that would be eliminated that support Twin Ponds water quality. Most of the ground-water drains West down slope toward I-5 then South to Twin Ponds. Up-slope residents have encountered springs, seeps, and leaky basements due to run-off sub surface and pump by sump back out that feeds this drainage system. Interruption of that system down-slope may have a deleterious affect upon the Twin Ponds quality. This is an on-going issue year round.

Why is the removal of the Tree border at Ridgecrest Park necessary? These trees and their root systems absorb down-slope water from Third Ave NE that drains through the sub-perk of the park

I-005-007 to the West end. The report does not mention subsequent removal of the 12' Berm on the East Park margin under those trees..... destroying visual balance, habitat, and auditory natural abatement soil sound damping characteristics. Opening that East side of the Park will enhance an already intolerable noise venue

I-005-004

Please see response to comment I-005-003 regarding noise. For vibration, mitigation measures include track isolation systems, which are effective and typically reduce vibration to below the FTA criteria.

I-005-005

Existing vegetation is not a notable source of mitigation for noise. Noise impacts are calculated based on existing noise levels plus light rail noise, as described in Section 4.7. Removal of vegetation from NE 155th Street to Ridgecrest Park is addressed in the Draft EIS on page 4-77 and in the high visual impact ratings for all alternatives on pages 4-84 and 4-85.

Habitat loss is addressed on page 4-136 of the Draft EIS. The Final EIS has additional detail on mitigation proposed for the Preferred Alternative.

I-005-006

The EIS includes a summary of the existing groundwater conditions based on available information. Project-specific geotechnical borings, including monitoring wells, will be installed to further evaluate groundwater conditions along the project alignment. Subsurface drainage will be provided where required to intercept and control groundwater seepage. Collected groundwater seepage and surface water will be infiltrated where possible to provide recharge to the regional groundwater system.

I-005-007

The Draft EIS describes the partial replacement of the berm and row of cottonwoods in section 4.17.2, page 4-216. Section 4.17 of the Draft EIS describes potential mitigation measures for Ridgecrest Park to include replacement landscaping and other improvements to restore the park to the same or better condition, and to construct a barrier between the light rail facility and the park that replaces noise reduction and visual

I-005-007 due to the supination
North to South of I-5 past the Bus Barn deflecting noise into our neighborhoods already. This report does
not mention mitigation of that nuisance.

I-005-008 Visual sensitivity notes are slanted toward I-5 traffic (driver perceptions) North to South and the reverse.
Visual sensitivity from individual residential properties are substantially absent from the DEIS. We are not
encouraged by the lack of resident's perspectives from the residential specific viewpoints.
Whether at Grade level or at elevated level, along this specific stretch of I-5 negative views are
anticipated, and will be detrimental to residential real estate valuations un-recoverable by owners
at future points of sale....already, realtors approach these homes with the first negative from their lips saying "Oh, it
right next to the freeway". What we can not hear or see now is bad enough.

I-005-009 Table 4.5-2 Potential mitigation measures as applied to #4 should be noted from NE 155th St to NE 178th St.
A. "Additional Landscaping and buffers" What type? How high?
B. "landscaping to screen adjacent residences" Use of mature vegetation, not yearling starts is necessary.
Since removal of trees and densities to 40 ft. will happen, how will you landscape to protect properties
60' 100'and 200' or 500' East of I-5 with vegetation? NOT!
C. "...noise and retaining walls"---see prior comments on elevation southbound I-5 higher than Northbound
since partial lids are the only fully effective deflector for properties above 50' above grade to 3rd Ave. NE.
D. "Relocated streets" is First av. NE one of them????Partially????
E. "Landscaping between guideway columns" will not reduce visual impact above guideway track levels.
Rail and trackway visibility will be a new form of visual pollution for our residential area.
F. "Texture, Patterns, color on walls" "Nonsense! More cost for the project and benefits only the drivers who are
so busy texting and cell-phoning they would be further distracted.

Samuel H. Bess

3

screening functions of the affected berm. The Final EIS has additional details.

I-005-008

The analysis in Table 4.5.1 includes more items directed at residential and other non-highway visual impacts than I-5 related impacts. The EIS addresses impacts on I-5 because of specific policies of state and federal agencies regarding highway appearance and specific state guidelines for roadside character. The extent to which vegetation removal, relocation of noise walls, and the elevated alternatives affect the visual integrity, unity and presence of encroaching elements is addressed throughout Section 4.5. The potential property value impacts of visual quality impacts are not addressed in this section. Section 4.3.4 addresses potential negative property value impacts of noise, light, shadow, views, access and parking.

I-005-009

Potential mitigation measures for visual quality impacts on Draft EIS pages 4-91 through 4-93 indicate general mitigation concepts and approaches. All of the potential mitigation measures identified have the potential for application to the area from NE 152nd Street to NE 178th Street as indicated in Table 4.5-2. Details such as the size and height will be developed during the final design phase of the project. As noted on page 4-91, it is likely to take 15 to 20 years to screen parking garages and noise walls and 30 to 50 years to replace the appearance of mature evergreen trees, and this is identified as an unavoidable adverse effect in the EIS.

Comments

I-006-001

The proposed stations at 220th and MLT transit centers are too close together. If you want people to ride the trains you must offer a time saving. With stops so close together, little time will be saved, so you will lose ridership. Conclusion: delete the 220th Stop - (B2A)

SOUNDTRANSIT RIDE THE WAVE

I-006-001

A Mountlake Terrace Transit Center Station with no proposed transit station at 220th Street was considered in the Draft EIS for Alternative B2. However, all the alternatives would offer a time savings over existing and future transit service, and would be competitive with the automobile.

Re: Sound Transit EIS comments

I-008-001

My wife and I own five rental properties along the west side of 5th Ave between 123rd and 125th NE. These properties have been specifically identified by Sound Transit to be acquired for the new light rail link between Northgate and Lynnwood. We are **really, seriously, absolutely, terribly worried and concerned** about Sound Transit's plan to condemn our property through eminent domain and the amount of compensation we will receive. We have met with staff at Sound Transit several times and have been informed that there is no other alternative route except through our property.

Our property consists of 27,000 sq. ft. of land with five equal tax parcels, with a total of 25,000 sq. ft. of living space and 30 parking spaces, 20 of which are under cover. Furthermore, since we own all the houses on the block face there is another 500 linear feet of street parking that our tenants can utilize. There are five separate buildings of 5,000 sq. ft. living space each. Three of the buildings were built in 2010 and the other two were completed in 2012. We have a 15 year fixed loan at 5.1% on the property. This project is so easy to manage we can do it all ourselves, in our spare time, and our only outside help is our accountant. We had a plan to have the property paid off at the end of the 15 year loan. This is probably the most perfect rental property in Seattle, in terms of age [new], cash flow, ease of management and ease of maintenance. It was designed and built in excess of the Seattle Building Codes, because we planned to keep it and will it to our daughter and grandson. Our daughter is already on the title. Our entire retirement plan is based on the income stream from this property, after 40 years of very hard work. This property provides very high quality affordable housing, including handicapped units, without any tax breaks, subsidies, or code variances; it is unique and irreplaceable.

Our property is located in the middle of what we call the tri-college area, surrounded by Shoreline Community College to the north, North Seattle Community College to the west, and the University of Washington to the south. In fact, we have had tenants from all three of these schools. It is only four blocks north of the Northgate Shopping Mall on the 41 bus line, one of the major bus lines in Seattle. I doubt you could find a better location in all of North Seattle to build affordable housing. We have had tenants from every conceivable slice of life with us in the last 4 years, and in that time we have received full rents for every unit for every day of every year since the buildings were completed.

I am 58 years old and in poor health, and my wife is 55 years old. I have a rare blood clotting condition as well as Type One diabetes and I had a catastrophic stroke in 2005. I was an invalid for two years, and by 2009 we were almost homeless. Since then we have worked 24/7 for the last 8 years to build our rental properties with the goal of them providing our retirement income. Since we are both the landlords and property managers when Sound Transit takes our property we will lose both our rental income and our jobs, both of which we love. We are both too old and worn out to start all over again in two or three years. We are already having stress and depression problems in trying to deal with this nightmare.

We **really need to know** that Sound Transit is going to be compensating us for the loss of our property. We need an equal replacement for what we are going to lose. The entire Puget Sound region is going to benefit from Sound Transit, but it shouldn't be built on the backs of people like us. When the taxpayers voted for Sound Transit [and we voted for it too] I doubt they intended for Sound Transit to abuse their power and take away the livelihood of little people like us without full, equal and just compensation. It is the only fair thing to do. If this is not your intention please let us know as soon as possible.

I-008-001

Thank you for your comment. Sound Transit recognizes that the relocation of a business or residence is an inconvenience and hardship for those involved. Sound Transit policy provides for a fair and equitable means of addressing real property impacts across its projects, and this includes a commitment to provide replacement structures in a manner consistent with state and federal law. This policy has been successfully implemented on several of the Link lines already. Sound Transit will help displaced parties to relocate in the same neighborhood or area where feasible. Similarly, when businesses are impacted, Sound Transit will conduct appraisals and work closely with business owners to determine the replacement value of impacted properties and enterprises, and to identify potential replacement properties. Section 4.1.7 discusses Sound Transit's acquisition and relocation policy.

Subject: Light Rail extension Comments

I-013-001 I am entirely in favor of extending the Light Rail north. In fact, I would prefer it if the train were able to make it all the way to the Everett Transit Center.

I-013-002 I would encourage the planners to utilize either of the open space options, so as to minimize the impact to the community as it currently stands. If ST has to buy or acquire existing buildings and land currently in use, it will create ill will in the community.

I currently live in Northgate, but have family in Everett and the Seatac areas, so a light rail connection that connected us all would be incredible.

--

Jono Hanks

1

I-013-001

Sound Transit recently performed a high-capacity transit corridor study from Lynnwood to Everett to explore extending high-capacity transit service to Everett. If you are interested in Sound Transit's future plans, please visit the agency's website at: www.soundtransit.org.

I-013-002

Thank you for your comment. It is not clear which open space options the comment is referencing, but the EIS alignments were selected based on available right-of-way, proximity to accessible stations, and environmental factors.

From: UBAHARISON@aol.com

Subject: To Lauren Swift

Dear Ms Swift:

I-014-001

This note is from my family: Jeff, Jurate, Daina and Maura Harrison. We are writing in regards to the construction of the Light Rail line which is to pass close to Latvian Hall in 3rd Street in the Northgate Area. We understand construction is to begin in that area in 2018. We are writing to beg of you to please do everything in your power to mitigate the impact of the construction on Latvian Hall, both in terms of noise and damage to the buildings.

Latvian Hall has served as the Community Center for most cultural and social events which happen in the Latvian, Lithuanian and Estonian Communities in the Puget Sound Region. My children have attended Lithuanian Dance Classes there weekly for many years, Many of our friend's sons and daughters, including my nieces, have gotten married there and I have attended many memorial services for members of our community who have passed away to mention but a few of the kinds of events we use the Latvian hall facility. We have celebrated Lithuanian Independence Day there in February for the past 22 years that we have lived in the Puget Sound area (Lynnwood). We have also hosted many fundraising events to support our activities as well as to support the Baltic Studies Program at the University of Washington.

These are just a few of the many activities we, as a family have attended at Latvian Hall. This building and property serves an extremely central and valuable role in our communities and would be an immeasurable loss were it to be damaged or seriously noise polluted.

Sincerely,

The Jeff Harrison Family

ubaharison@aol.com

I-014-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you, the region's Latvian community, and the larger Baltic community. Following the publication of the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). With the realigned street, access to the property has been maintained. Sound Transit will mitigate moderate and severe noise impacts, as identified using FTA criteria; see Section 4.7, Noise and Vibration, of the EIS for the noise analysis. Sound Transit does not expect damage to the buildings on the church property as a result of this project.

Comments

I-027-001 In segment B alternatives. I like the alternative B2A with a stop at 220th Street SW to allow commuters get the job sites. There are also CT connection (110, 119, 130) next to 220th St. SW.

I-027-002 Approaching Lynnwood Transit Center, I like alternative C3 which follow I-5 route as much as possible to reduce noise to the S. Lynnwood neighborhood.

I-027-003 I would also like to see if more parking ~~will be~~ added to Lynnwood P&R or even a parking garage will relieve the parking problems there.

SOUNDTRANSIT RIDE THE WAVE

I-027-001

Thank you for your comment stating a preference for Alternative B2A due to job access and bus connections.

I-027-002

Your comment stating a preference for Alternative C3 alignment due to reduced noise impacts to south Lynnwood neighborhoods is noted.

I-027-003

The Preferred Alternative analyzed in the Final EIS would include approximately 530 new parking spaces at the Lynnwood Transit Center. This net increase of parking spaces would help address the current parking constraints at the transit center.

Comments

I-028-001

To my opinion, I believe putting ~~a~~ stations close to transit center and parking space would make most sense. Without parking space or close to transit Center, it could limit people who commute a lot from/to North and South. I believe the link light rail is to help reduce the traffic of I-5, so placing stations at where no parking space is available is losing the ~~pu~~ main purpose of the project.

I-028-002

As for the project area alternative, if it is possible to keep the light rail next to I-5, it will be less affect to the ~~neighbourhood~~ neighborhood. So for Segment C, alternative C3 would be more attractive and ~~it would~~ has the least affect to the near by environment and business.

SOUNDTRANSIT RIDE THE WAVE

I-028-001

Park-and-ride lots are being planned at the majority of stations, with the exception of the NE 130th Street Station.

I-028-002

Your preference for Alternative C3 due to fewer neighborhood and business impacts is noted.

Subject: Comments on the Draft EIS

I-029-001

My wife and I have read through much of the document obviously with an eye toward its impact to us. We find the document extensive with lots of information but little is said about proposed traffic mitigations and/or improvements in the neighborhoods surrounding the proposed stations. Perhaps we missed it. Our interest lies particularly in the 185th station. With regard to this station in particular we support what appears to be the leading option (#1) for its lower cost and that it puts the rail at ground level which would seem to minimize the environmental noise and visual impact. We also like the idea of a proposed parking garage to handle commuter traffic.

Thank you.

Marv and Norma Lee

1

I-029-001

Proposed traffic mitigation measures are identified in Section 3.6.4 of the EIS. Potential improvements at the NE 185th Street intersection are outlined in Table 3-27.

Your preference for the NE 185th Street Station Option 1 is noted.

To: Lynnwood Link DEIS
Subject: Comments on Segment within City of Shoreline

Hi Lauren or other:

I-032-001 As a City of Shoreline resident, I am very excited about LINK extending through our city and serving us through two future stations. My family lives between I-5 and 5th Ave NE at approximately NE 167th Street and will therefore be somewhat impacted by the I-5 alignment. Not that it will sway anyone's decision, but my preference is for an at-grade vertical profile running along the east side of I-5 between the 145th/155th Street station and the 185th Street station. An elevated section, while perhaps more manageable in terms of WSDOT right of way use and the on-the-ground LINK footprint, would really be a blight on our neighborhood in my opinion.

I-032-002 In terms of station location, we also support a 155th Street station over a 145th Street station since it serves more of the "heart" of Shoreline and certainly our Ridgecrest neighborhood. Bike lanes and sidewalks (although both could use widening and improvement) already exist along 155th Street to support non-motorized travel and access to/from a future park-and-ride structure would not need to compete with I-5 interchange ramp traffic as would be the case at 145th Street. In addition, while the 155th Street corridor is not as extensive in connecting outlying areas compared to 145th Street, it would connect the LINK station to a large potential redevelopment site just east of the SR 99/155th Street intersection where the Central Market grocery store and Sears are located. 155th Street connects to Westminster Way which is a heavily traveled route to the Crown Hill, Ballard, and Greenwood neighborhoods of Seattle not to mention Magnolia and Queen Anne. As such, King County Metro connector sevice could leverage on a 155th Street station location quite well. High density development will be challenging to implement near a 155th Street station (not impossible though) but this will also be the case with 145th Street since the SE quadrant golf course (Jackson Park) is a 4F issue and Lakeside School occupies much of the SW parcels west of I-5. Over time, the Ridgecrest neighborhood will become ripe for upzoning if not already at that point now. Property values are relatively modest and older residents (> 65) are slowly giving way to a younger generation of families that will likely embrace higher density, mixed-use development and place greater value on transportation access and efficiency.

In any case, please consider an at-grade alternative for the LINK alignment through Shoreline as well as a 155th Street (vs. 145th Street).

Thank you for listening to the residents of Shoreline and I hope the EIS process and follow-on design and construction phases go smoothly.

Best Regards,

~ Anthony Lo

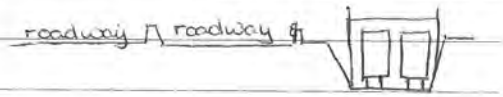
Sound Transit wants to hear from you. Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

I-035-001

If possible look at more "low" elevated or surface options. This will minimize I-5 driver distraction which I often see along central link (SR518/I-5 Boeing Access). Incidents, transit vehicle racing ~~and other~~ and driver distraction are items that can be minimized with a surface or submerged line ~~thru~~ until a transit stop.



SOUNDTRANSIT
RIDE THE WAVE

I-035-001

Thank you for your comment noting your preference for alternatives that are lower elevation.

Comments

I-036-001 In segment A, I prefer A5 or A7, and lean toward A5. Reasons: A station on 130th is vital to enhance east-west bus connections between 2 designated urban villages. 155th is better than 145th because there is more room for development (TOD), better distances between stations, less congested access for ped/bike/bus. In A5, it is not clear if the "at grade" station at 130th is grade-separated from 130th. If not, A7 is better. If it is, then A5 is better because it costs less and has less parking @ 185th.

I-036-002 In segment B, I prefer B2A, even though it is most expensive. Reasons: At NLT TC, a station on the east side of the parking garage is significantly closer to destinations east & south. There is very little west of I-5. A station at 220 would serve a lot of offices and apartments. It is worth the extra cost.

(over)

SOUNDTRANSIT RIDE THE WAVE

I-036-001

Sound Transit acknowledges your preference for a station at NE 130th Street and NE 155th Street and appreciates your summary of benefits related to siting stations at these locations. All stations and alternative alignments are grade separated from streets.

I-036-002

Sound Transit acknowledges your preference for Alternative B2A.

I-036-003 In segment C, I prefer C1 because it best serves the neighborhood not just the transit center.

I-036-004 Back to segment B, at 236th south to Gateway complex, please create a direct walkway. I used to work at Gateway and know firsthand that the transit center is next to useless for Gateway destinations, because the ped. path through the neighborhood is long and not easy to find. A direct path would almost double your effective walkshed.

Subject: comments on Lynnwood Link

I have several comments:

I-041-001 1) Please make every effort to avoid destroying even more Lynwood neighborhoods. Lynnwood is poorly laid out and neighborhoods here have to fight to keep them quite with single family homes.

I-041-002 2) Linking to Lynnwood sounds great, but without connecting to Alderwood Mall or to the 164th street Park and Ride it seems not very well integrated into the local transit network.

I-041-003 3) I have already suggest via another email to Metro that the local transit system should attempt to make public transportation easier to navigate. One simple thing is to add in the bus tunnels arrows at each station saying which station we just left, the current one and the next station.

Steve Pearson
425-778-1316

1

I-041-001

Thank you for your concerns about the impacts to Lynnwood neighborhoods' character and cohesion from the several alternatives under consideration in Segment C.

I-041-002

Multiple connections to local and commuter bus routes will be available at the Lynnwood Transit Center, providing service to nearby destinations. Current Sound Transit planning efforts are also considering extending high-capacity transit north beyond the Lynnwood Transit Center.

I-041-003

Your suggestion is noted, but the passenger information system for the larger transit system is not the subject of this EIS.

Comments

My concerns are 2-fold -

I-042-001 (1) Place the stations as close as possible to the parking lots / parking garages. So, for example, at NLT at 236th, put the station on the east side as in your plan. People need to walk the shortest distance possible. This needs to be your overall policy.

I-042-002 (2) Build this as quickly as possible. If you have more cash flow, due to increased tax income, build more segments faster. Some of us are older + may never enjoy it but will have paid a lot.

SOUNDTRANSIT RIDE THE WAVE

I-042-001

Your preference for stations located as close to parking as possible is noted.

I-042-002

The project schedule was provided in Figure S-9 in the Draft EIS Summary chapter. As depicted in Figure S-9, there are many steps that go into a large public transportation project such as the Lynnwood Link Extension. Starting in 2010 and slated for completion in 2023, the primary steps for the Lynnwood Link Extension includes an alternatives analysis, development of the Draft EIS, development of the Final EIS, design and permitting, and finally, construction. All these activities include public and agency coordination.

Subject: comments on Lynnwood link extension

Hello,

I-044-001

I attended a meeting at Northgate West Condos last week and would like to say that I prefer alternative A1 because it would have the least impact on my property, and if I understand the options correctly, the least impact on the trees east of 1st Ave NE. The large trees between 1st Ave and the condo property should be preserved. Efficient public transit is a priority in the Puget Sound region, but so is preserving the urban tree canopy in Seattle. It's difficult to reach Seattle's goal of 30% canopy cover if we cut large trees down. The trees help with air quality and people's psychological (and hence physical) health. Please do whatever is possible to preserve those large trees.
Thank you.

Ginger Rebstock
11300 1st Ave NE #125
Seattle, WA 98125

Comments

I-047-001

I find this abhorrant that you will take away our ingress and egress to the Latvian Church at 117th & 3rd and our parking area, leaving us totally land locked and thereby rendering our Latvian Center unusable — And you refuse to provide us with any alternative to gain access via the destruction of other adjoint homes. It really comes down to the fact that nothing matters to you except your rail line. You are destroying an entire community center for the Baltic People of Washington. I hope you are happy about it

SOUNDTRANSIT RIDE THE WAVE

I-047-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

TO WHOM IT MAY CONCERN;

I-048-001 | PLEASE SELECT OPTION C-1 FOR THE LINK LIGHT RAIL. I BELIEVE THIS WOULD BE THE BEST SELECTION FOR LYNNWOOD.

The 1st Avenue/N 117th Street overcrossing would include bicycle and pedestrian facilities with reconstruction. However, it would not be reconstructed with the Preferred Alternative alignment. All stations would include bicycle and pedestrian facilities. See Section 3.2.5 in the Final EIS for more information.

From: Steve Senter <steve.shoreline@gmail.com>
Sent: Friday, August 02, 2013 11:14 AM
To: Lynnwood Link DEIS
Subject: LLE Segment A Comments

Hello,

I-051-001 Thank you for preparing and providing the DEIS materials on your website. I found them to be comprehensive and detailed without devolving into 'legal-ese' and becoming completely incomprehensible.

I live near the proposed station and changes at 155th, so naturally these options are my focus of interest. I value the intention of extending light rail northward and look forward to using the services (when ready in a decade or so); I currently take buses to and from the Northgate center - downtown during the week.

I-051-002 My primary concern with the proposed station at 155th and I-5 is the potential loss of the Shoreline Fire Department Station 65 on the East side of I-5. I didn't find in the materials (though confess I didn't read every document) whether or not the station would be impacted, but I can only assume so given its proximity to the light rail route. Would the rail station require the loss of the fire station? The fire department provides coverage over a wide section of this part of town, and frequently responds to calls from the retirement center on 1st and 149th across from Twin Ponds park.

I-051-003 My other key concern relates to impacts on local traffic. The section covering this in the materials (section 3.1.4) clearly points out that 155th from Aurora to 15th is already at risk for poorer LOS with or without the proposed rail station, and I wonder what the City of Shoreline plans for the future. I already experience the stated peak AM and PM LOS along Meridian and can only anticipate how this and neighboring roads will be impacted - 1st Ave NE from 155th south in both direction could become impassible given its narrow roadway and no paved shoulders, with car and foot traffic to the park, wildlife crossing and the fire station responses in addition to the projected increase in light rail user congestion.

The task of determining the best location for the rail stations is daunting and I appreciate the care and concern put into the DEIS materials preparation and presentation. Please respond to my concerns, or direct me to the appropriate sections in the online materials.

Thank you,

Steve Senter
15314 Corliss Pl N
Shoreline, 98133

I-051-001
Thank you for your comment.

I-051-002
None of the alternatives that include a station at NE 155th Street would displace the fire station, and the Preferred Alternative does not include one. Sound Transit is aware of concerns about the possible impacts of a station at NE 155th Street on the operations of the fire station at that location. If the project selected for construction includes a station at NE 155th Street, Sound Transit would work closely with the Fire Department to resolve any potential conflicts with bus and vehicle traffic to ensure that emergency response times would be maintained both during the construction period and operation of light rail.

I-051-003
Mitigation measures for any impacts from traffic congestion as a result of traffic accessing a station or park-and-ride will be included as part of the project; see Section 3.6.4 in the Final EIS.

Comments

I RECENTLY ATTENDED THE OPEN HOUSE MEETING AT THE NILE SHRINE GOLF CLUB. I TALKED TO A NUMBER OF PERSONS FROM SOUND TRANSIT ORG. REGARDING THE STATUS OF MY PROPERTY AND WHAT ARE MY OPTIONS.

I-052-001 I WAS TOLD BY MR. ROGER IWATA THAT BASED ON THE DRAFT EIS ALTERNATIVES BEING CONSIDERED, MY PROPERTY WILL BE PARTIALLY ACQUIRED AND THAT THE EXISTING SOUND WALL OF THE FREEWAY WILL BE MOVED MUCH CLOSER TO MY HOUSE AND SOME EXISTING STRUCTURES IN MY BACKYARD LIKE STORAGE AND GREENHOUSE MAY HAVE TO BE RELOCATED. WE HAVE MADE OUR BACKYARD AND SURROUNDING GROUNDS MORE PRODUCTIVE BY PLANTING FRUIT TREES AND VEGETABLES.

I-052-002 AT PRESENT WE ARE ALREADY EXPERIENCING MODERATE NOISE AND

SOUNDTRANSIT RIDE THE WAVE

PAGE 1 OF 3

I-052-001

Mr. Iwata provided you with the information that we had available at the time of the publication of the Draft EIS. Since then, Sound Transit has made design modifications to some of the alternatives and has also identified its Preferred Alternative. Both of these actions have resulted in some changes to the potential property impact list. The final determinations about which properties will be a full or partial acquisition will not occur until final design, which is after the completion of the environmental process and Sound Transit's and FTA's selection of the alternative to be built. In the meantime, Sound Transit will continue to communicate with property owners as information becomes available. Sound Transit staff are available to discuss your concerns. Please contact Roger Iwata at: roger.iwata@soundtransit.org. Section 4.1 of the Final EIS discusses potential acquisitions and displacements.

I-052-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria. Sound Transit's policy is to mitigate light rail transit noise that would otherwise result in moderate or severe impacts per FTA criteria. Potential mitigation measures are described in Section 4.7.7 of the Final EIS.

Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, if any existing WSDOT noise walls are removed and replaced as part of the project, they will meet the requirements of, and be approved by, WSDOT and the FHWA.

Sound Transit will take measures to deter potential crime at stations and parking facilities; see Section 4.14.2 of the Final EIS.

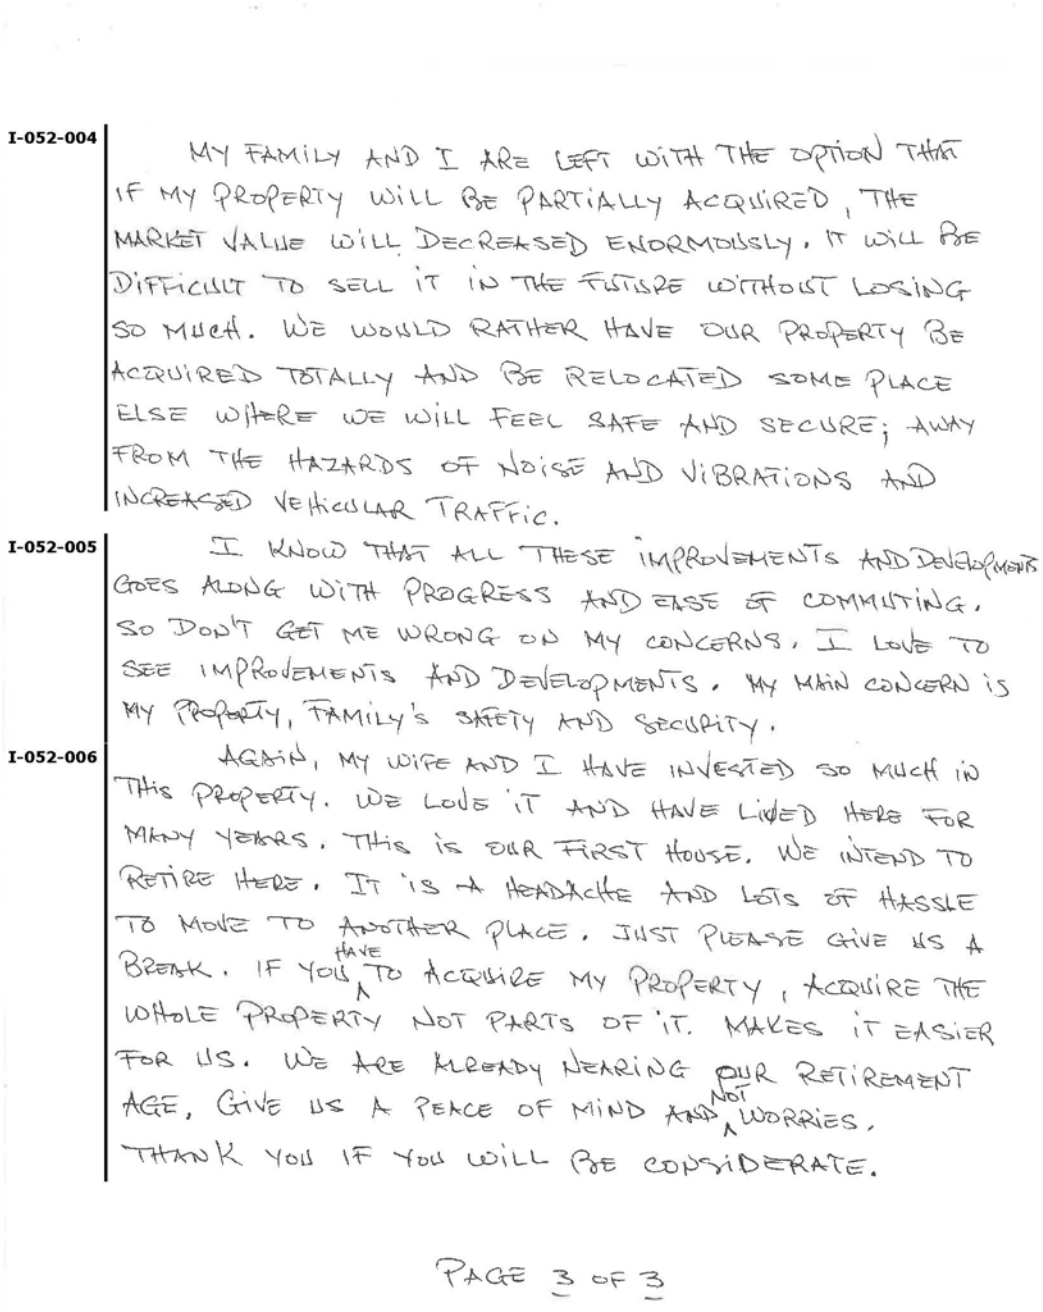
I-052-002 VIBRATIONS FROM THE FREEWAY CAUSED BY BIG TRUCKS AND TRAILERS. THESE WILL GET WORSE AND WILL BE COMPOUNDED WHEN THE LIGHT RAIL IS BUILT DURING CONSTRUCTION AND START OF OPERATION BECAUSE OF THE CLOSE PROXIMITY TO MY HOUSE. ALSO, ANOTHER CONCERN IS THE 5TH AVENUE, N.E. STREET INFRONT OF MY HOUSE, WHICH IS ALREADY BECOMING BUSIER OF VEHICULAR TRAFFIC ESPECIALLY DURING PEAK HOURS FOR DRIVERS AVOIDING THE I-5 TRAFFIC JAM. IT WILL EVEN GET WORSE WHEN THE CONSTRUCTION AND BUILDING OF RAIL STATION AND PARKING AREAS ON N.E. 185TH ST. AND THE BRIDGE. WHEN THE LIGHT RAIL STARTS OPERATION, THERE WILL BE MORE UNFAMILIAR FACES IN THE VICINITY OF MY HOUSE WHICH IS A SECURITY AND SAFETY CONCERN FOR MY FAMILY.

I-052-003 IN ONE OF THE ALTERNATIVES PRESENTED TO ME IS THE ELEVATED PORTIONS, THE HEIGHT OF THE RAILTRACT WILL BE SOMEWHERE AROUND 35 FEET IN WHICH CASE IT WILL BE OVERLOOKING MY HOUSE AND MY BACKYARD; NOT GOOD OPTION BECAUSE WE WILL LOSE OUR PRIVACY AND HIGH RISK ALSO FOR OUR SAFETY AND SECURITY. FOR SURE THERE WILL BE RIDERS IN THE TRAIN WHO MAY BE WATCHING MY PROPERTY AND MAY DEVELOP MALICIOUS INTENTS. PERSONS CAN TAKE PICTURES OF MY PROPERTY OR FAMILY FROM THEIR CELLPHONES. WE ARE IN THE HIGH TECH GENERATION NOW.

PAGE 2 OF 3

I-052-003

In addition to noise walls and guideway features, the trains would be moving at speeds of up to 55 miles per hour, and views of your property would likely be fleeting.



I-052-004 MY FAMILY AND I ARE LEFT WITH THE OPTION THAT IF MY PROPERTY WILL BE PARTIALLY ACQUIRED, THE MARKET VALUE WILL DECREASED ENORMOUSLY. IT WILL BE DIFFICULT TO SELL IT IN THE FUTURE WITHOUT LOSING SO MUCH. WE WOULD RATHER HAVE OUR PROPERTY BE ACQUIRED TOTALLY AND BE RELOCATED SOME PLACE ELSE WHERE WE WILL FEEL SAFE AND SECURE; AWAY FROM THE HAZARDS OF NOISE AND VIBRATIONS AND INCREASED VEHICULAR TRAFFIC.

I-052-005 I KNOW THAT ALL THESE IMPROVEMENTS AND DEVELOPMENTS GOES ALONG WITH PROGRESS AND EASE OF COMMUTING. SO DON'T GET ME WRONG ON MY CONCERNS. I LOVE TO SEE IMPROVEMENTS AND DEVELOPMENTS. MY MAIN CONCERN IS MY PROPERTY, FAMILY'S SAFETY AND SECURITY.

I-052-006 AGAIN, MY WIFE AND I HAVE INVESTED SO MUCH IN THIS PROPERTY. WE LOVE IT AND HAVE LIVED HERE FOR MANY YEARS. THIS IS OUR FIRST HOUSE. WE INTEND TO RETIRE HERE. IT IS A HEADACHE AND LOTS OF HASSLE TO MOVE TO ANOTHER PLACE. JUST PLEASE GIVE US A BREAK. IF YOU HAVE TO ACQUIRE MY PROPERTY, ACQUIRE THE WHOLE PROPERTY NOT PARTS OF IT. MAKES IT EASIER FOR US. WE ARE ALREADY NEARING OUR RETIREMENT AGE, GIVE US A PEACE OF MIND AND NOT WORRIES. THANK YOU IF YOU WILL BE CONSIDERATE.

PAGE 3 OF 3

I-052-004

Sound Transit recognizes that the acquisition of property for light rail projects is an inconvenience and hardship for those involved and understands your concern about the potential partial acquisition of your property. The direct loss of property value due to the partial acquisition will be compensated through the Sound Transit Acquisition and Relocation Policy as discussed in Section 4.1.7 of the EIS. Section 4.3.4 of the Final EIS discusses property values near light rail transit stations.

I-052-005

Crime is not expected to increase as a result of operation of the stations. Several studies have concluded that crime around stations mirrors crime rates in the surrounding neighborhoods. Most areas in the project corridor have low crime rates. The stations are well lit, are continually monitored by security cameras, and are regularly monitored by security personnel. Sound Transit would implement a number of measures to deter crime in the station areas. Measures to minimize crime would include the use of equipment (e.g., closed-circuit TV, sealed fare boxes, and automatically sealed exits), the use of anti-crime programs such as anti-graffiti programs, and the use of security personnel. 2010 crime statistics related to already built Sound Transit facilities show that the crime rate per number of riders at transit facilities and on light rail and commuter rail trains is substantially lower compared to overall per capita crime rates in Seattle, Tukwila, and SeaTac.

I-052-006

Sound Transit recognizes that the acquisition of property for light rail projects is an inconvenience and hardship for those involved and understands your concern about the potential partial acquisition of your property. Sound Transit determines a full or partial acquisition by considering several factors related to the potential impacts to the property. Please see the Final EIS Section 4.1 for the potential acquisitions related to Preferred Alternative, and updates for some of the

other alternatives. The final determination of acquisitions for this project will not occur until final design. Sound Transit will continue to communicate with property owners potentially affected by the project as information develops.

If your property remains on the list for a partial acquisition after final design, Sound Transit's Acquisition and Relocation Policy provides for a fair and equitable means of addressing real property impacts across its projects. The agency is available to answer questions about how full and partial acquisition determinations are made and to provide information about compensation for partial acquisitions.

Comments

I-053-001

The project is great, but it will be cutting across the Latvian Evangelical church's parking lot. The construction and operation of the light rail extention would cause disruption of the classes, markets, services, plays, etc. that occur inside. Also, there would be less of the existing parking. I know that it is difficult to find parking currently. It would be wonderful if an alternative route or compensation land property would be given to the Latvian Evangelical church. The Light rail system is, and will be, very useful. Thank you Thank you for taking my thoughts into consideration.

SOUNDTRANSIT RIDE THE WAVE

I-053-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Sound Transit wants to hear from you. Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

I-054-001 (1) The noise from the project would disrupt classes in the Latvian community center, and would create problems when the center holds it's annual markets.

I-054-002 (2) The train would reduce what little parking space there is to practicly nothing.

I-054-003 (3) the tracks for the light rail would reduce trees, meaning less privacy for the center.

I-054-001

The noise analysis for the Lynnwood Link uses the FTA impact criteria, and Sound Transit mitigates noise impacts to levels below these criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

I-054-002

The Lynnwood Link Extension would modify parking at Seattle Latvian Evangelical Lutheran Church, but its overall parking supply is expected to be maintained.

I-054-003

Removal of trees is addressed in Draft EIS discussion in Section 4.5.3, including Table 4.5-1. The Preferred Alternative would also have noise walls at heights similar to the existing walls, which would limit views of the center from the train. Potential mitigation measures are discussed in Section 4.5.6.

TO WHOM IT MAY CONCERN;

I-055-001 | PLEASE SELECT OPTION C-1 FOR THE LINK LIGHT RAIL. I BELIEVE THIS WOULD BE THE BEST SELECTION FOR LYNNWOOD.

THANK YOU, Lynn Smith

Subject: Lynnwood Link Impact to Seattle Latvian Lutheran Church/Center

To whom it may concern,

I-057-001

It has come to the attention of the Latvian-American community that the Seattle Latvian Lutheran Church/Center is slated to be impacted in a very negative manner from the construction of the Sound Transit Lynnwood Link project. The impact to the church/center which is described in the draft environmental impact statement (DEIS) is completely unacceptable, and Sound Transit must come up with a better solution to mitigate the impact to, not only the Seattle Latvian Lutheran Church/Center, but to the Latvian-American community as a whole.

The Latvian-American community within the Seattle is one which is very vibrant. Participant range in age from those displaced from Latvia by World War II up to those who were born after the fall of the Soviet Union and beyond. The community is a multi-generational one with many families participating in similar manners. There is strong participation and membership in many different Latvian-American organizations that all utilize the Seattle Latvian Lutheran Church/Center throughout the year. Some of these organizations are as follows:

- The Seattle Latvian Lutheran Church Congregation
- The Seattle Latvian School
- Latvian Dance Group "Trejdeksnitis"
- West Coast Latvian Education Center
- Latvian Pensioners Group
- University of Washington Baltic Studies Program
- American Latvian Association
- American Latvian Youth Association

The impact to the Seattle Latvian Lutheran Church/Center outlined in the DEIS would not only impact the physical structure of the center, but it would also impact the viability of these groups. The loss of the center would decimate all of these groups, as the central meeting place that has stood for decades (let us not forget that the original Seattle Latvian Lutheran Church/Center was demolished as a result of the I-5 freeway construction) would no longer stand, and what served as a major point of pride for the community would cease to exist.

For many of us, the center is a central rallying point, as many who actively participate in the Latvian-American community live not only in Seattle, but also in the suburbs and throughout the state of Washington. The Seattle Latvian Lutheran Church/Center is also not only significant within the State of Washington, but it is also significant throughout the United States and beyond. The Seattle

1

I-057-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you, the region's Latvian community, the larger Baltic community, and those interested in Scandinavian studies.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

I-057-001

Latvian Lutheran Church/Center is one of less than 15 Latvian Centers throughout the United States. Many events held at the Seattle Latvian Lutheran Church/Center attract participants from all over the United States, as well as from Canada, England, Australia, and of course, Latvia. The center serves as a community gathering point for the Latvian-American community. The center routinely holds events, meetings, study groups, affinity groups and political interest groups all organically developed internal to the Latvian-American community. The center has attracted Latvian theater groups, musical groups, authors, poets, politicians as well as past Presidents of Latvia for events held there. The center also serves as a home to The Seattle Latvian School and the Seattle Latvian Lutheran Church. Other groups also use the center. The center is utilized by our brothers and sisters in the other Baltic communities within Seattle; the Lithuanian and Estonian communities (who do not have centers of their own). The loss of the center would greatly impact the viability of these types of events and groups, and would most certainly damage the terrific culture which has been developed through the Latvian-American community within Seattle and beyond.

On a personal note, the loss of the Seattle Latvian Lutheran Church/Center would be one of very personal significance to me. As a child born during the Cold War, to the son of Latvian immigrants forced out of Latvia by the Communists during World War II, the Seattle Latvian Lutheran Church/Center has played a major role in my life. I attended The Seattle Latvian School, attended numerous church services there, participated for over 20+ years with events held at the West Coast Latvian Education Center and have been an active participant in the American Latvian Youth Association. Next summer I will have my wedding held at the Seattle Latvian Lutheran Church/Center, just as my parents held their wedding in the same place so many years ago. I have buried many relatives and friends not far away from the church in the Latvian section of the Evergreen Washelli Cemetery, with the large majority of the services and wakes held at the Seattle Latvian Lutheran Church/Center. The Seattle Latvian Lutheran Church/Center has served as a major landmark throughout my personal life, and I can only hope that I am able to pass along such a special place to my offspring.

I am urging Sound Transit to consider the thoughts not only of myself, but that of the greater Latvian-American community when considering the options for the Lynnwood Link expansion. The Latvian-American community has so much at stake and we hope that Sound Transit has our best interest in mind.

To: Lynnwood Link DEIS
Subject: Please save the Latvian Community Center

I-061-001

Dear Lauren Swift, I am a member of the Lithuanian American community in the Seattle area. My family and I have been attending events such as Lithuanian independence celebrations, Christmas holiday potlucks etc. at the center since 1993, when we moved to the Northwest. I am writing to you to voice my request that any construction on the Lynwood light rail extension minimize its impact to the Latvian Community center.

The Latvian community center is hugely important to the Lithuanian community in Seattle. This is where we meet. This is where new immigrants to the United states come to connect with their heritage, to network and get established in the Seattle area. This is where our children learn about our culture and grand history.

I am afraid that having a rail line go through this property will result in this meeting place no longer being viable. And finding an alternative, suitable location in the Seattle area is not likely to happen. Therefore I urge you to take steps to minimize the light rail's impact to the Latvian community center.

Thanks and regards
Justas Vilgalys
18320 NE 204 ct.
Woodinvlle, WA 98077

Subject: Comments on DEIS - Shoreline

I-062-001 Seems like, from a spacing perspective, there should be three stations – 130th, 155th, and 185th – to maximize ridership without having to drive to a station. Perhaps consider some improvements in the vicinity, such as adding bike lanes or adding footpaths that cut through multi-block residential sections (where currently you have to walk around the long way), especially near a 155th Station (as ridership here has a lower projection). Drawing people from the neighborhood without having them drive would really make the Light Rail valuable as a mass transit/lower emissions option. I don't seem to recall parking garages at every Max station in Portland.

I-062-002 The visual impacts seem very high for all proposed stations and rail, especially considering reduction of light to existing homes and removal of mature trees. You might consider green roofs for parking garages, reduction in the amount of reflective concrete (I'm thinking heat), and plantings that will really make a difference in the visual aesthetics (ie. not just minimal borders). Shoreline is proud of its tree cover and removing a large number of mature trees without adding larger trees back into the mix is going to be detrimental to that.

I-062-003 Is there any possibility of building a smaller garage or of building the garage underground? What about building a park or playground on the roof? It would help integrate this structure into the neighborhood.

I-062-004 If a station at 145th will be built, I vote for Option 2. It seems this would retain more mature trees and improve the aesthetics of residents to the north of the relocated I-5 Northbound onramp and would fit better with the neighborhood. In addition, this is supposedly going to help traffic flow. You may be able to do very appealing visual things to the retention ponds. Mosaics on the walls by a local artist.

I-062-005 I am trying to understand if the only noise mitigation planned is to build or improve noise walls. What sort of insulation in older homes are you considering and who will be eligible? On the maps I see houses marked as being impacted by noise, but a parcel in between two impacted houses supposedly is not. Does that make sense?

Confidentiality Notice: This e-mail message, including any attachments, is for the sole use of the intended recipient(s) and may contain confidential and privileged information. Any unauthorized review, use, disclosure or distribution is prohibited. If you are not the intended recipient, please contact the sender by reply e-mail and destroy all copies of the original message.

I-062-001

Thank you for your comment stating a preference for a station at NE 130th, NE 155th, and NE 185th Streets. The project's analysis shows that ridership would be maximized with the NE 145th and NE 185th Street Stations. Sound Transit policy is to assess the need for improved pedestrian and bicycle facilities within 1/4 mile of the station, and Sound Transit will continue to develop the station access program as the project progresses.

Park-and-ride spaces minimize parking impacts to neighborhoods and provide access to light rail for areas transitioning from suburban to urban densities. The number of new park-and-ride spaces in the corridor includes approximately 432 at NE 145th Street, 500 at NE 185th Street, and an additional 530 at the Lynnwood Transit Center.

I-062-002

Visual impacts discussed in the Draft EIS vary greatly by geographic area and are high in areas with more removal of mature vegetation or substantial structures.

The City of Shoreline also has a tree replacement ordinance, as does WSDOT, for its lands. Sound Transit will meet the requirements of both where applicable.

I-062-003

The proposed size of the garage reflects the likelihood that some people will need to drive to access the light rail system, and the size of the garage at various locations reflects current use and future demand. The NE 185th Street Station has a garage option that is underground.

I-062-004

Your preference for the NE 145th Street Station Option 2 is noted. The

potential for mitigating visual impacts of retaining walls and incorporating art on walls is discussed in the Final EIS, Section 4.5.6.

I-062-005

The noise analysis for the Lynnwood Link Extension uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below these criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

For homes that still have impacts after noise wall mitigation, sound insulation may be considered. This form of mitigation can include improvements, such as new or upgraded windows, improved door seals and other measures to maintain low interior noise levels.

TO WHOM IT MAY CONCERN;

I-063-001 | PLEASE SELECT OPTION C-1 FOR THE LINK LIGHT RAIL. I BELIEVE THIS WOULD BE THE BEST SELECTION FOR LYNNWOOD.

The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

I-064-001

The Link Light Rail project ~~enter~~ extending to Lynnwood will negatively impact the Seattle Latvian community. The Latvian Lutheran Church has been an active and central meeting place for Latvians in the North-west for decades. I personally grew up in the building, that includes a ballroom, stage and classrooms. I was baptized and confirmed in the church, I learned to speak my family's native language at the saturday school, I continue to connect with, participate in and help preserve my Latvian culture on a weekly basis. Cutting off access to the Latvian Church would cut off a lifeline for Latvians living in the United States and this is unacceptable.

SOUNDTRANSIT RIDE THE WAVE

I-064-001

Thank you for your personal comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you, the region's Latvian community, the larger Baltic community, and those interested in Scandinavian studies.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

To: Lynnwood Link DEIS
Subject: Preference for the Lynnwood Link Light Rail Line

To Whom It May Concern,

I-065-001

My preference for the Lynnwood Link Light Rail line is A5 + B1 + B2A + C1. That would give an at-grade station at 130th, an elevated station at 145th, an at-grade station at 185th, an east side station at Mountlake Terrace, and a north side station at Lynnwood. B2A would add a 220th station better serving more people for not much more of a cost in the big picture. I believe it's important to include the parking at 130th and there is more density near the 155th station than the 145th station which would better serve the people. I believe C1 is best because it gets closest to the center of Lynnwood's business and Alderwood Mall. However, if possible, it may be better to go with C2 and save the $300 million for an additional stop Alderwood Mall.

Thanks,
Chris

1

I-065-001

Thank you for providing your alternative preferences for the project, and the reasons you prefer them. In November 2013, the Sound Transit Board identified its Preferred Alternative. The identified Preferred Alternative includes Alternatives A1, B2, and a modified C3. The Board directed the EIS to consider modifications to each of these alternatives for the Preferred Alternative. For instance, the Final EIS considers stations at NE 130th Street in Segment A and 220th Street SW in Segment B, which were not part of Alternative A1 or B2 in the Draft EIS. To understand all the components of the Preferred Alternative, please see the Final EIS for the full description and evaluation of it.

I-066-001

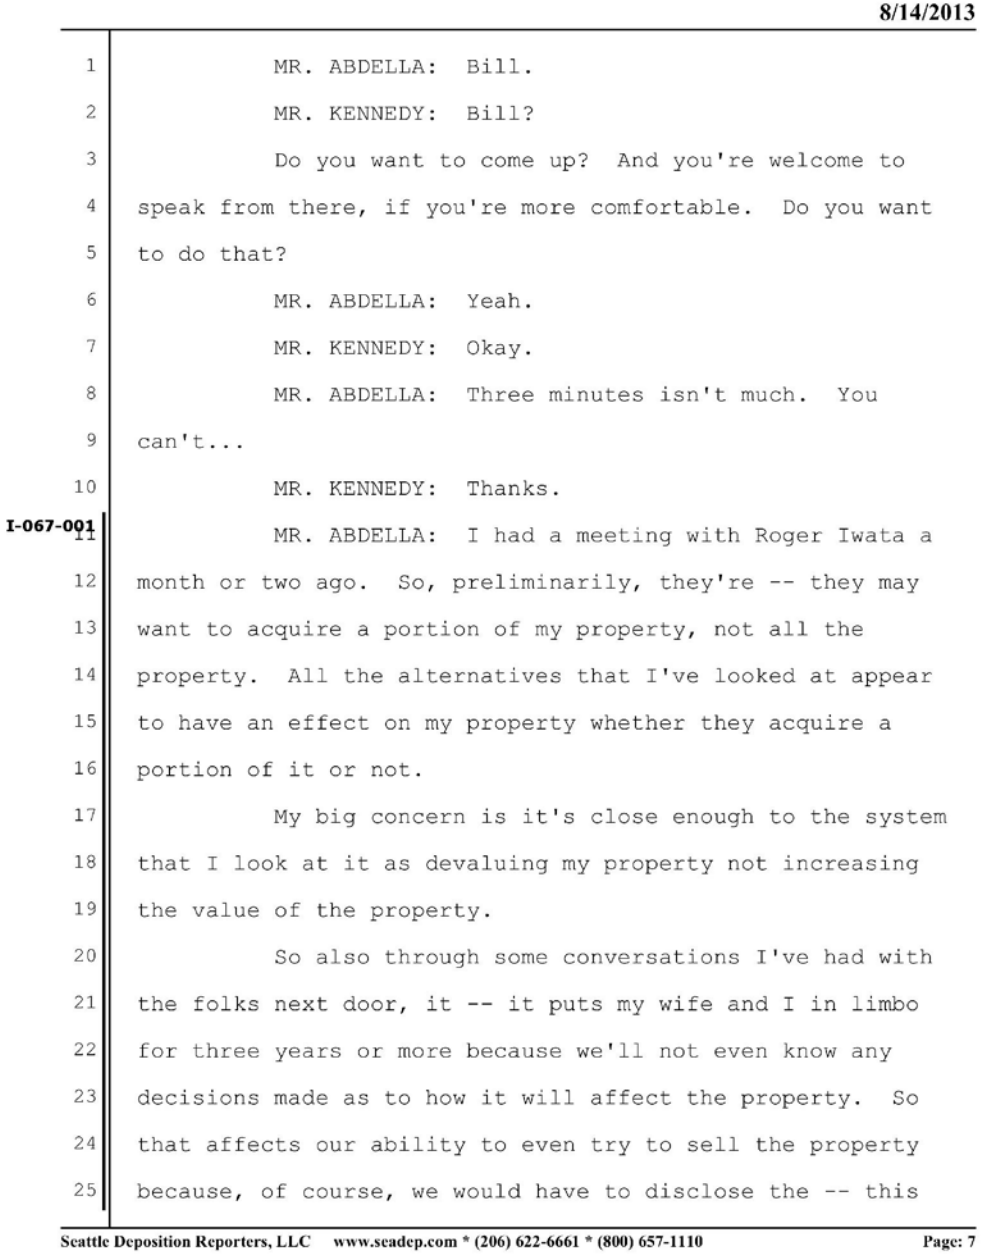
Thank you for your comment in support of the Lynnwood Link Extension Project.



8/14/2013

MR. ABDELLA: Bill.

MR. KENNEDY: Bill?

Do you want to come up? And you're welcome to speak from there, if you're more comfortable. Do you want to do that?

MR. ABDELLA: Yeah.

MR. KENNEDY: Okay.

MR. ABDELLA: Three minutes isn't much. You can't...

MR. KENNEDY: Thanks.

I-067-001

MR. ABDELLA: I had a meeting with Roger Iwata a month or two ago. So, preliminarily, they're -- they may want to acquire a portion of my property, not all the property. All the alternatives that I've looked at appear to have an effect on my property whether they acquire a portion of it or not.

My big concern is it's close enough to the system that I look at it as devaluing my property not increasing the value of the property.

So also through some conversations I've had with the folks next door, it -- it puts my wife and I in limbo for three years or more because we'll not even know any decisions made as to how it will affect the property. So that affects our ability to even try to sell the property because, of course, we would have to disclose the -- this

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 7

I-067-001

Sound Transit recognizes that the acquisition of property for light rail projects is an inconvenience and hardship for those involved and understands your concern about the potential partial acquisition of your property. Sound Transit determines a full or partial acquisition by considering several factors related to the potential impacts to the property. See the Final EIS Section 4.1 for the potential acquisitions related to Preferred Alternative, and updates for some of the other alternatives. The final determination of acquisitions for this project will not occur until final design. Sound Transit will continue to communicate with property owners potentially affected by the project as information develops.

If your property remains on the list for a partial acquisition after final design, Sound Transit's Acquisition and Relocation Policy provides for a fair and equitable means of addressing real property impacts across its projects, as discussed in Section 4.1.7 in the Final EIS. The agency is available to answer questions about how full and partial acquisition determinations are made and to provide information about compensation for partial acquisitions.

I-067-001 whole plan and everything.

You know, we -- we don't mind progress. We don't mind spending our tax dollars to forward progress. But I'm looking at it as taking a whole bunch of money out of my pocket. I mean, this is retirement. The property and the home is retirement. And I'm not getting answers -- any good answers about compensation, especially if only a portion of the property is acquired.

I-067-002 So you know, we're -- we're -- I mean, obviously, we're not going to stop the progress, but we're not looking at this as a good thing. And we won't know for -- again, for a long period of time whether soundproofing would be -- for whether that -- the property is going to be a candidate to have soundproofing and vibration dampening and all these kinds of things done. So it's -- it's really -- it's telling us, as property owners, Hey, just hang in there.

We are not getting any answers, and is this going to benefit us or not? I don't believe so. I don't see how it can based on the proximity to where we're living, in proximity of the light rail and the station that will more than likely be going in a half a block or so away from us.

MR. KENNEDY: Thank you very much.

And I just want to reiterate that we're not responding or answering questions here in this public hearing. And you raise some good points, obviously. I

I-067-002

The noise analysis for the Lynnwood Link Extension uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below these criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

For homes that still have impacts after noise wall mitigation, sound insulation may be considered. This form of mitigation can include improvements, such as new or upgraded windows, improved door seals and other measures to maintain low interior noise levels.

For vibration, mitigation measures include track isolation systems, which are effective and typically reduce vibration to below the FTA criteria.

would encourage you to talk to folks out here. We've got, in fact, our noise expert, Michael Minor, out here in the noise area that you might want to ask some questions about noise mitigation related to your property. I think you can probably find it on a map out there.

So at any rate our next speaker signed up is Don Beskin. Is that --

///

///

///

///

///

///

///

///

///

I-068-001 MR. DALE: I'll just echo a little bit of what the last gentleman said about access. My gut is that 145th goes in. I think that's -- if there's people here that don't like that, I'm just thinking that is what the feedback I've gotten, that's a top-priority site.

I-068-002 I'm more concerned with the very likely station at 185th. And part of that is for other stations as well, where you're really dropping a station into a single-family home neighborhood; where at 185th, there are not entrances to I-5, there is not a major arterial that connects, say, Aurora all the way to Lake City Way; and so the impact on the folks that live there, some of the possible zoning that may happen; and Sound Transit's role in both the relationship to the Shoreline Public Schools and the property that's there that are properties of interest for development, but also what the recommendations are as they partner with the City of Shoreline I think are huge and will greatly impact not only the folks in Shoreline but also the partnership communities in Lake Forest Park and even Mountlake Terrace where we are tonight.

So I just wanted to reiterate sort of the neighbor feel for all of these stops and really thinking through both in terms of what gets decided at 185th, 145th, versus 155th and even the possibility of 130th.

And I think a lot of people would echo that

I-068-001

Sound Transit acknowledges your preference for a station at NE 145th Street. The Preferred Alternative evaluated in the Final EIS includes a station at NE 145th Street. Please see the Chapter 2 of the Final EIS for a description of the Preferred Alternative and its potential effects. A decision about which alternative is built for this project will not be made until after the Final EIS and federal Record of Decision are issued.

I-068-002

Your comment identifying concerns for potential impacts of the Lynnwood Link Extension is noted. As you pointed out in your comment, several of the proposed locations for light rail stations are adjacent to single-family residential neighborhoods and the introduction of the station and ancillary facilities and other improvements could be a concern. The transit stations would be located along a freeway and on the edges of existing neighborhoods and would not encroach into the central portion of these older stable residential neighborhoods. Section 4.2, Land Use, of the EIS discusses the project's impact on surrounding land uses during construction and operation. Neighborhood cohesion would not be expected to change, although localized visual character would change. Section 4.5.6 outlines mitigation measures to facilitate station compatibility. They address building design, landscaping, and noise wall texture.

I-068-002 sentiment of, you know, how is this going to effect, not just ten years from now. We get caught up in sort of the vision and the grandeur of what would -- what this would be like in 20 years.

But I'd like to think about what it's going to be like in five years and impacting people with the construction in where people live now. And then, of course, in ten years at least when it hopes to launch. So I think just really thinking through those things of having the neighborhoods, rather than developers, as a first thought is really important.

I-068-003 Just to quickly add, I still wonder why -- when we talk about spacing of stops, why was 205th -- and I know it's not for questions tonight -- but why was 205th removed and pulled off the table? If you think of it as the connection between the ferry from Edmonds all the way to Lake Forest Park, that, to me, would seem the most logical place to try to have a good hub that represents Edmonds, Mountlake Terrace, Shoreline, Lake Forest Park as a huge through point. I guess the downside of that is more congestion.

But if you think about that, some of the things I've heard are, Well, we want spacing of stops, and I get that. But if you look at the fact that 130th and 145th are still on the table as a possible two stops, look at that

I-068-003

Sound Transit explored a variety of station alignment design and siting choices along the I-5 corridor from Northgate to Lynnwood. The alternatives discussed in the Draft EIS reflect public and agency comments and suggestions made during the environmental scoping comment period. The development of alignment, profile, and station siting concepts also included working with local jurisdictions and WSDOT. After the development of alternative concepts, Sound Transit evaluated how well these various concepts addressed the project's purpose and need, or other considerations, such as environmental impacts and costs.

A station at 205th Street was not considered because it would be much less accessible than the nearby Mountlake Terrace Transit Center, which already has parking and transit infrastructure. It would also be very difficult to site a station in a freeway interchange.

The decision to consider the NE 130th Street and NE 145th Street stations as components of the Segment A alternatives was based on the public and agency involvement, and evaluation of their ability to meet to the purpose and need of the project, and other factors. Please see Chapter 2 Alternatives Considered for a better understanding of the alternatives development process.

I-068-003
distance and then compare it to, say, 205th up to just north of the Mountlake Transit Center, it's about equal distance.

I-068-004
So I think the possibility of having a better parking structure that wouldn't impact single-family homes, it's got to be thought about there.

Thank you very much.

MR. KENNEDY: Thank you, sir.

Is there anybody else that would like to speak tonight at this hearing? Please feel free. We have another gentleman.

Would you like to sign --

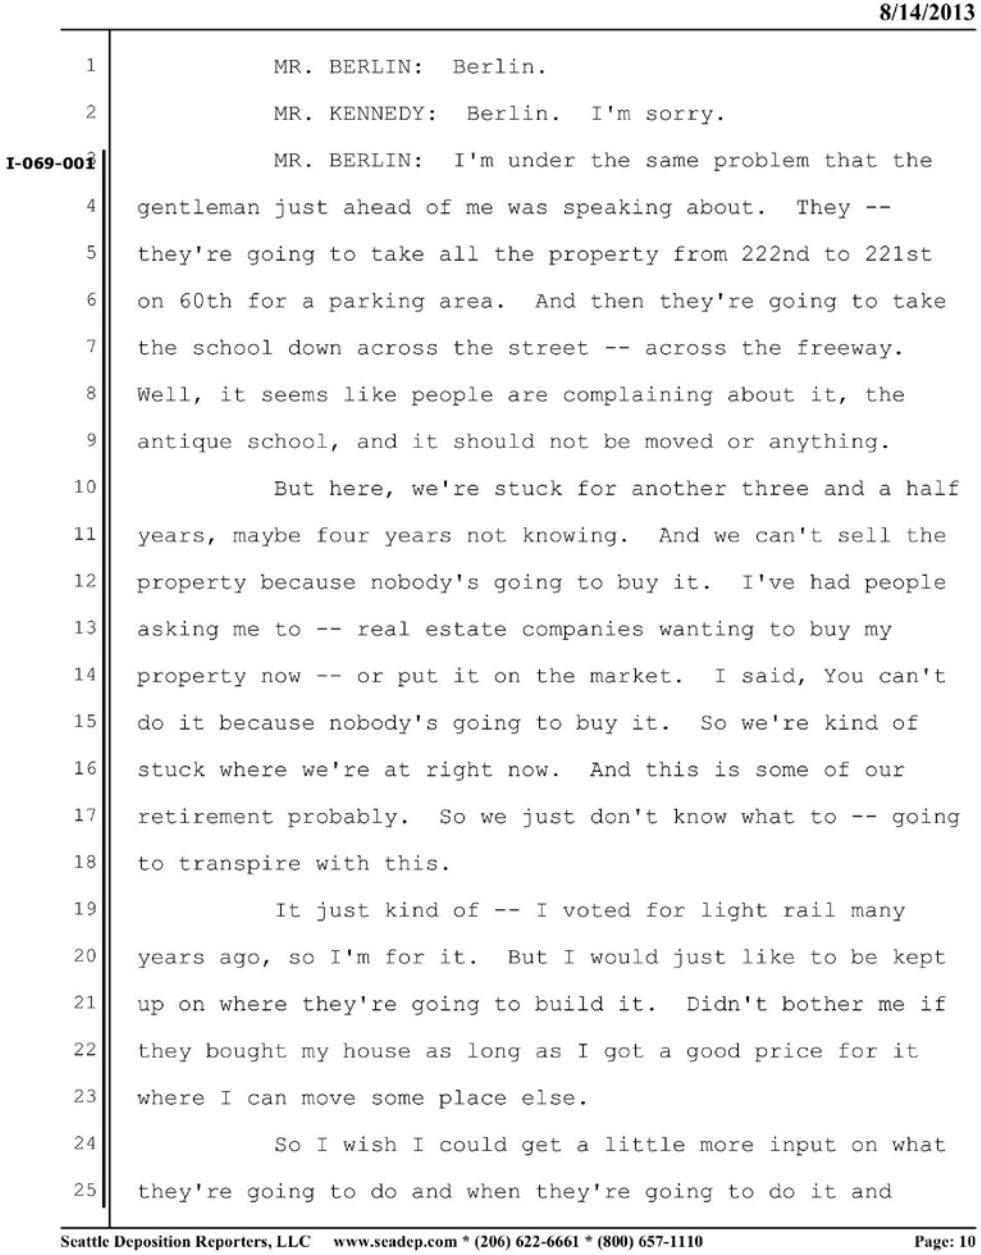
I-068-004

Sound Transit will continue to develop the detailed plans for stations and parking structures during final design.



8/14/2013

MR. BERLIN: Berlin.

MR. KENNEDY: Berlin. I'm sorry.

I-069-001 MR. BERLIN: I'm under the same problem that the gentleman just ahead of me was speaking about. They -- they're going to take all the property from 222nd to 221st on 60th for a parking area. And then they're going to take the school down across the street -- across the freeway. Well, it seems like people are complaining about it, the antique school, and it should not be moved or anything.

But here, we're stuck for another three and a half years, maybe four years not knowing. And we can't sell the property because nobody's going to buy it. I've had people asking me to -- real estate companies wanting to buy my property now -- or put it on the market. I said, You can't do it because nobody's going to buy it. So we're kind of stuck where we're at right now. And this is some of our retirement probably. So we just don't know what to -- going to transpire with this.

It just kind of -- I voted for light rail many years ago, so I'm for it. But I would just like to be kept up on where they're going to build it. Didn't bother me if they bought my house as long as I got a good price for it where I can move some place else.

So I wish I could get a little more input on what they're going to do and when they're going to do it and

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 10

I-069-001

Sound Transit will be avoiding impacts to the Edmonds School District property.

Sound Transit recognizes that the acquisition of property for light rail projects is an inconvenience and hardship for those involved and understands your concern about the potential partial acquisition of your property. Final determinations of the property needs for the project, including acquisitions (partial and full) and displacements, will be based on the project's final design after Sound Transit completes the EIS process, selects the alternative to be built, and develops final engineering and design plans. Minimization of acquisitions, displacements, and relocations is a priority for Sound Transit.
Please see the Final EIS Section 4.1 for the potential acquisitions related to Preferred Alternative, and updates for some of the other alternatives. The final determination of acquisitions for this project will not occur until final design. Sound Transit will continue to communicate with property owners potentially affected by the project as information develops.
If your property remains on the list for a partial acquisition after final design, Sound Transit's Acquisition and Relocation Policy provides for a fair and equitable means of addressing real property impacts across its projects. The agency is available to answer questions how full and partial acquisition determinations are made and to provide information about compensation for partial acquisitions.

I-069-001 start giving us prices, whatever they're going to pay for these houses, because there's five or six houses right there on -- between 222nd and 221st that they were going to tear down and make a parking garage there. But they've changed it since people started hollering about the church and the school, Melody Hill School.

So that's my biggest concern, what we're going to do. And my neighbor next door to me, she just bought the house. And she gets this notice in the mail. She didn't know anything about the light rail. And -- and she was sick for a week because she didn't know what she was going to do after that. But now she -- she's got a lot more information on it, still would like to know what's going to happen.

So I appreciate your time. Thank you very much.

MR. KENNEDY: Thanks for your comment.

One thing that might be helpful just to reiterate is that, as far as schedule goes -- and again, we're not answering questions, but I'm trying to provide a little background -- you know, we're taking comments right now on the draft EIS.

The comments that are being made, that we'll receive in this public hearing tonight or written or any mailed comments, they'll be responded to in the draft -- in a final EIS that will come out probably sometime later in 2014. So your comments tonight will be responded to in

the final EIS.

The Sound Transit board will be making a decision on a preferred alternative, probably this fall. And that preferred alternative will be studied in the final EIS. So there'll be a little more certainty after this fall about what alternatives are really off the table and what's going forward. So it may be that some people will know, you know, their property is not part of the preferred alternative fairly soon, within the next three to six months. So I think that -- that may be helpful to some folks.

Our next speaker signed up is Eric Raisters.

8/14/2013

MR. RAISTERS: Yes.
MR. KENNEDY: Is that correct?
MR. RAISTERS: That's correct.
I-070-001 Yes. Thank you for the chance to speak on this. I'm -- I'm a little concerned and would like to express my concern about the fact that -- that the -- some of the alternatives have already been ruled out; namely, going up 99 or going up 5th or 15th or something like that.
I-070-002 That -- that our -- I don't represent the board, although I am a member of the board of the Latvian Evangelical Lutheran Church, which right now is looking at getting their property completely taken away.
It's a church that's been around for, in that location, 42 years. And we already had our property taken away, the first time, by the city of Seattle when they built the Wallingford Playfield.
We never were notified. In fact, the first we ever had any inkling that this was going to come through our property was in May of this year when Roger Iwata came to the community center and asked to talk to someone in the community center.
I-070-003 I'm looking at the schedule that you have out there. At that point, you had already ruled out all of the other alternatives that would have potentially not affected the Lutheran -- the Latvian Lutheran Church and community

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 13

I-070-001

Prior to the development of the Draft EIS, Sound Transit studied various corridor options for this project. That work is called the Alternative Analysis and the reports are available to the public in Appendix K of the Draft EIS and on the Lynnwood Link Extension website at: http://www.soundtransit.org/Projects-and-Plans/Lynnwood-Link-Extension/Lynnwood-Link-Document-Archive/Lynnwood-Draft-Environmental-Impact-Statement. This analysis showed that high-capacity transit along I-5 would be most beneficial when compared to high-capacity transit on SR 99, NE 5th or NE 15th. Sound Transit spent a great deal of time considering corridor options other than I-5. Please review the Alternatives Analysis Report for this evaluation.

I-070-002

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Sound Transit has been in contact with representatives of the church prior to May 2013; see Appendix L, Public Involvement and Agency Coordination, of the Final EIS for a table that lists Sound Transit's outreach activities to the church.

I-070-003

At the time of the publication of the Draft EIS, alternatives located in

I-070-003

center.

And we had no notice of it. The board apparently made these decisions without consulting with the communities that they were going through. And to me, that does not seem like a very democratic procedure, and it doesn't seem like the right way to do things.

I just want to make a comment on that, and I'll leave it at that. Thank you.

MR. KENNEDY: Okay. Thank you for your comment.

Our next speaker, signed up, is Gunars Sreibers; is that correct? Is Mr. Sreibers here?

He's out in the hall, I think.

While we're waiting, is there anybody else that might want to speak or has -- you're welcome to sign up now or -- it looks like we have Mr. Sreibers.

Mr. Sreibers?

///

///

///

different corridors (such as SR 99 or NE 15th) had been considered but dismissed; see response to comment I-070-001 above.

See the response to I-070-002 directly above that addresses how the project will not displace the Latvian Evangelical Lutheran Church. Sound Transit has been in communication with the church since 2012; see Appendix L of the Final EIS for a table that lists Sound Transit's outreach activities to the church.

MR. SREIBERS: My name is Gunars Sreibers. And I'm representing the Latvian Lutheran Church and community center located just north of Northgate. I-071-001

And the Baltic community is extremely disappointed in the lack of recognition the DIS [sic] has written into it regarding the social and cultural contributions of our community to the Seattle and Pacific Northwest. The Latvian center is the hub of Baltic community activities in the community and represents thousands of Baltic residents here in the Seattle metropolitan area.

The DIS fails to address any of the impacts, I-071-002 construction as well as operation of the light rail system, will have on our numerous activities that occur at the center on an ongoing basis.

The alternatives include one that also mentions the complete elimination of this center which, in essence, will result in the demise of this center because the relocation of it will be so difficult and the activities -- discontinuation of activities would essentially be eliminated -- or it would not -- no longer be able to occur.

The center is a multigeneration facility. We were really surprised by the fact that in investigating the facility the -- the staff and the people preparing the EIS did not recognize the fact that this is more than just a church. This represents the hub of the Baltic community and

I-071-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Please see Section 2.5.1 of the Final EIS for a description of the refined Segment A alternatives that avoid displacing the church.

I-071-002

Chapter 4 of the Draft EIS discusses the project's impacts during construction and operation. Section 4.4 discusses impacts to social resources, including the church.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

I-071-002

the activities of Baltic community, not only in the Pacific Northwest but all the way up to Alaska, California, and heading towards the east.

Not only is it a place where a lot of Baltic people get together, but it is also a center that involves everybody from toddlers to seniors. It also has active church services in three languages, Latvian, Lithuanian, and Estonian. It has special events and holidays, that are unique to the Latvian and the Baltic cultures, that occur there. A Latvian language school is held there on a routine basis, on a regular weekly basis.

We have dance groups. We have choir groups that travel to Latvia and are invited to go to Latvia. We have fraternal groups and we have senior citizens groups that meet there and multiple groups within those larger groups.

It's visited by the presidents by the Baltic countries. It is also visited by the ambassadors of those Baltic countries.

It is also the focal point for, not only the establishment, but also the continued funding of the Baltic studies programs at the University of Washington.

Any of the alternatives that we're looking at here that cause for the disruption or even the permanent relocation of this facility will essentially be devastating to the Baltic community. And measures must be taken,

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

I-071-002

basically, to find mitigation measures that will allow us to continue our existence in the present location.

Thank you.

MR. KENNEDY: Thank you very much for those comments.

Well, that's everybody that is signed up that we have so far. We do have, it looks like, somebody else who would like to sign up.

Sir, can you -- can I get you to sign up?

Where -- is Erin -- where did Erin go?

Sir, why don't you come up? I'm going to get you signed in here. Thanks.

MR. SMIDCHEMS: Guntis, G-U-N-T-I-S; last name Smidchems, S-M-I-D-C-H-E-M-S. I live -- my mailing is the University of Washington, Department of Scandinavian Studies, Box 353420, Seattle, Washington, 98195.

I-072-001 I'm here from the Scandinavian Department. We teach Latvian, and that's why -- that's our connection to the Latvian center which is on the planned line.

Our department does community outreach events every year, like concerts or lectures or social events. October 23 is one of our outreach events, the Latvians and the Estonians of the Seattle community.

And I'm here, more, to find out how that community center is affected by this project and to see how that is going. It's definitely -- we have -- at the department, we have two kind of legs in the local community. One is the Nordic museum in Ballard, and this is our other place where we meet people off campus.

So that's about all I wanted to say. I'm just curious about how that's going.

///

///

///

///

///

///

I-072-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Please see Section 2.5.1 of the Final EIS for a description of the refined Segment A alternatives that avoid displacing the church.

HARVEY: I've already signed in on one of them.
MR. KENNEDY: Did you --
HARVEY: I don't know which one it was.
MR. KENNEDY: Okay. Well, you're not -- you're not on this list. So why don't you sign in, if you would, please. Thank you.
I-073-001 HARVEY: We just moved into this area. And I'm starting to get an impression that you really don't care who lives here, who you have to move, who you have to crush. I don't know what you're thinking in who moves or who has to move. And there's a lot more I could have said, but it would have taken up 20 to 30 minutes.
And that's all I can really say right now.
MR. KENNEDY: Okay. Thanks.
Is there anybody else that would like to comment?
If not, I would encourage people to make comments. We have a comment form out here. You can e-mail comments in, as Mr. Earling was saying. There's a variety of ways to comment other than here.
If you actually want to come back and comment to the court reporter, you can do it. If you feel a little bit like you don't want to comment in this type of a setting, feel free to come back. She will be here until 8 o'clock.
But keep in mind the draft EIS. The reason for doing it is to get your comments. We invite your comments.

I-073-001

Thank you for your comment. Minimizing the number of residents displaced, as well as the number of properties acquired for this project is a priority for Sound Transit. In addition to the information on specific affected properties in the EIS, Sound Transit has contacted potentially affected parties to offer information and assistance.

We want your comments. That's the point of a draft EIS, so we can -- so our board, that Mr. Earling and others are on, can take those into consideration when they make a decision.

So we do take your comments seriously. We invite your comments. We've got many experts out here on -- on every aspect of the project, design, noise, environmental. So please take advantage, ask them questions.

So I thank you for coming tonight.

And we have another person here. Would you like to speak?

PUBLIC MEMBER: I just have a question. I notice that on the comment forms, these are self-mailing with the stamp. Will you have any available to take some with us when we leave, for others in the community?

MR. KENNEDY: Yeah.

MS. TAYLOR: We have plenty. Just come see me.

MR. KENNEDY: Thanks.

Great. Well, thank you for calling [sic]. I will bring this hearing to a close. Thanks for coming.

///

///

///

///

///

///

MR. FOY: John Foy, from Lake Forest Park. Is anyone else from Lake Forest Park here this evening?

I-074-001 I took the most direct route to come here because -- 205 or I guess 240th, some people call it 205. For Lake Forest Park residents, my concern is the -- the stops are going to be one at Northgate, that's pretty well declared, the Northgate stop. Then there's an idea that 130th is going to be a stop, which is so close to Northgate.

But 145th, which is the most direct route into Lake Forest Park -- the most direct route -- all the other routes, we must go through other traffic, other cities, other traffic. 145th is the only direct entrance into Lake Forest Park, Kenmore, into Bothell Way. And that is doubtful right now. My understanding is that it is not in discussion or it -- they're looking at it, but it's not.

May I inform the -- Sound Transit that the city council of Lake Forest Park has just moved to build about four hundred units of housing on the corner of Bothell Way and 145th.

Given that traffic, which will mean that if there is no stop at Sound Transit at 145th, those people are going to be going through all the other exits and into -- we've objected to the number of -- to the number of housing going in there, but the council, in their wisdom, as many councils often do, do not pay attention to the citizens of the city

I-074-001

A station at NE 145th Street was under consideration for the Draft EIS and is also included in the Preferred Alternative in the Final EIS. Sound Transit has been considering a station at this location since the beginning of the environmental review process. Thank you for the additional information on the City of Lake Forest Park's plans for development on NE 145th Street to the east of the proposed station.

I-074-001 and decide to go ahead and do what they want. And that's -- it's going to devastate the neighborhood. And we have complained about it, but nevertheless, there it is.

I also will appear at the next one in Shoreline because Shoreline has this same concern about there is no direct entrance. 145th is the only direct entrance into Kenmore, Lake Forest Park, Bothell Way. Otherwise we have to go through various cities in a roundabout way.

Thank you.

MR. KENNEDY: Thank you, sir.

It looks like, next up, we have Mr. Dan Dale.

///

///

///

///

///

///

///

///

///

MR. ANDREJEVS: I'm Markus, M-A-R-K-U-S; Andrejevs A-N-D-R-E-J-E-V, as in Victor, -S, as in Sam.

Address is 3818-228th Place Southwest, Brier, Washington 98036.

I-075-001 And then, my comments, I was going to comment on the fact that it's a sad situation. Sounds like the board members have already made the decision. It doesn't seem like we had a vote, if it was even a vote. We just now have to deal with the decisions that are being made.

This Latvian community center that I'm most concerned with being closed off to the community, not only the Latvian community, but Lithuanians, Estonians, people from Canada come down to visit, dignitaries, politicians. We have -- the University of Washington also performs plays and have -- they have fund-raisers there.

And for the entire amount of time that it's going to take to build this light rail system, will be detrimental to those community members and groups and their functionality.

That's -- about wraps it up.

(Proceedings concluded at 8:00 P.M.)

-o0o-

I-075-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

MR. REEDY: First name is Robert. Last name, Reedy, R-E-E-D-Y. My address is P.O. Box 61, Mountlake Terrace, 98043.

I-076-001 And I would say, if I was in front of everyone, we have been fighting this issue since the old monorail in 1962, the Seattle World's Fair. And they wanted to bring it all the way up here. So for 50 years we've been fighting the same thing. I say let's go. It's time that we did something. It's time to move and move forward.

That's all I have to say.

Sound Transit
Draft EIS Comments
C/o Lauren Swift
401 S. Jackson St.
Seattle, WA 98104

Dear M. Swift

I-082-001 I is a resident of Aegis of Assisted living in Shoreline. I would favor proposed straight line between Federal Way to Lynnwood. This plan would provide the best selection of smaller cities that are older

I-082-002 People -- those with physic handicaps -- would have less crowded shopping options to the W. of W. would be a more major asset of the the "straight" line proposal.

Thank you for this opportunity to share opinion about this proposed plan.

Sincerely,
William C. Pedersen

I-082-001

Thank you for your suggestion for a straight-line alignment of the light rail system between Federal Way and Lynnwood. A full discussion of the overall proposed light rail system can be found in "Sound Transit 2: A Mass Transit Guide - The Regional Transit System Plan for Central Puget Sound"published by Sound Transit in July 2008. However, the scope of the Lynnwood Link Extension EIS is focused on connections between Northgate and Lynnwood.

I-082-002

Thank you for your comment about the importance of serving the small communities along the route of the proposed Lynnwood Link Extension project. As demonstrated by the number of stations and combination of stations represented in the several alternatives evaluated in the EIS, Sound Transit is committed to providing the best service to residents along the entire route of the proposed light rail extension. Also, the construction of all light rail transit facilities (sidewalks, stairs/elevators, and access into the light rail train cars) will comply with all required standards of The Americans with Disabilities Act of 1990 to ensure access by the elderly and persons with physical disabilities. See Section 2.3 of the Final EIS.

From: Capt. Andrew Reay-Ellers <capt_reayellers@yahoo.com>
Sent: Wednesday, August 21, 2013 3:01 PM
To: Lynnwood Link DEIS
Subject: Fw: shoreline LINK meeting(s) follow-up
Attachments: Letter to SOWERS-reTOD-21Aug2013.docx

To Lynnwood Link DEIS Comment-processing staff;

I-083-001

Last December, when the Sound Transit Board voted to adopt Transit-Oriented-Development policies, I was very heartened to see that lessons had been learned; and that Sound Transit now appreciated the value and accepted the necessity of TOD in creating a successful transit system.

With this in mind, you can imagine my dismay in reviewing the recently released DEIS for the Lynnwood LINK portion of the light rail system.

The designers and planners of this proposed section of light rail have disregarded Sound Transit's TOD policies. It appears that nothing has been learned, and the ST staff has ignored the directions of the board, and the criteria you have established. Every proposed station is sited immediately next to the highway, and the potential for TOD at each of these sites --by Sound Transit's own estimates-- is "Limited".

At recent public meetings and presentations by Sound Transit in the Shoreline area I have been asking questions about Transit-Oriented-Development, and trying to point out the shortcomings in the plan as it is currently proposed. I cannot say that the local staff seem to think this is an important issue. They seem to want to discuss nothing at this point other than alternatives of at-grade vs. elevated stations; and where exactly they will build the enormous parking garages they propose.

I am following up some of those discussions with a letter to one of the Sound Transit outreach staff, Nytasha Sowers. A copy of my letter to her is both included below, and attached to this email.

Basically, rather than being a part of an integrated regional transit system, it seems like the cities of Shoreline, Mountlake Terrace, and Lynnwood are simply expected to accommodate the passage of a commuter rail line . . . . This is NOT what the "Link Light Rail" system is supposed to be about -- a series of Park & Ride Garages along

1

I-083-001

Thank you for your letter regarding Sound Transit's TOD Policy and for your interest in creating transit-oriented communities in the station areas. Sound Transit's project was designed to respond to the purpose and need described in Chapter 1. The Sound Transit policy on TOD is intended to help guide the development of the project, but it does not override the project's purpose and need, and it is to be considered along with other design and environmental considerations that shaped the development of alternative alignments and stations. Please see Chapter 2, Section 2.6.1 for more details on factors affecting the alternatives.

I-083-001 the highway. Vibrant integrated station-areas --with good opportunities for TOD-- are a 'must' if Sound Transit's Light Rail system is to be a success.

I am working to write an official and complete set of comments regarding the Lynnwood Link DEIS, and will send those to you when they are complete. In the meantime, I am sending you a copy of my correspondence with Ms Sowers for the record.

I hope that the Sound Transit staff, and especially the Lynnwood Link Team will please look into this issue, and consider the flawed planning and missed opportunities of the current Lynnwood LINK design.

thank-you,

andy reay-ellers

Subject: shoreline LINK meeting(s) follow-up

Dear Ms. Sowers--

I-083-002 I wanted to 'follow-up' with you a bit.....

Two weeks ago, at the 185th station committee meeting, I was one of the people asking you about the [lack of] TOD potential in the proposed design of the Lynnwood LINK. Previous to that, I had been one of the people asking you similar questions at the 145th station-area visioning meeting the week before.

2

I-083-002

Since the release of the Draft EIS and the identification of the Preferred Alternative, the City of Shoreline has conducted additional planning that would help create development patterns more oriented to transit at the NE 145th Street and the NE 185th Street stations. The assessments of the potential for TOD reflected a variety of factors, including local regulations, market conditions and availability of land. The City of Lynnwood, the City of Mountlake Terrace and Sound Transit have also been working collaboratively to advance the TOD potential in their station areas. During final design, Sound Transit also will continue to consider TOD development partnerships and related opportunities to design the station and station areas in ways that support TOD. However, the station locations and the decisions to include parking facilities respond to other Sound Transit policy commitments, including for system access (encouraging a balance of modes, and recognizing the need to serve existing as well as future land use patterns in the larger corridor), sustainability, and environmental management. As described in more detail in Chapter 2, other corridors away from the freeway were considered, but the environmental impacts of building light rail through established communities with few other continuous north/south corridors besides SR 99 limited the potential for placing stations other than adjacent to I-5. Please see Chapter 4, Land Use, Section 4.2.5 for a discussion on TOD potential.

While it may seem that I keep asking the same questions, I'm not. (though admittedly my questions are certainly closely related). Likewise, regardless of what you may think, I am very much interested in your answers.

I-083-002

I am trying not to repeat myself, but rather to continuing to research and ask questions in hopes of helping me to refine my DEIS comments, so I am focusing on defining the problems in sound transit's conceptual strategy of designing the Lynnwood Link.

In detail, and review:

At the visioning meeting I asked you about better siting/aligning/designing the shoreline stations to maximize and encourage -- or at the very least, ***allow for*** -- good TOD and adjacent "smart growth" urban planning and integration.

[please note, again, that I am in no way asking for re-consideration of a SR99 or N.E. 15th alignment.]

Your reply to me, in part, was that while LINK will try and locate stations where TOD can best happen, not all stations can have this attribute. Different stations can and will serve different purposes.

I have to say that while I might wish that EVERY station area be developed in a "dense, developed TOD" way, I heard what you had to say and I guess it helped me to realize that this is unrealistic. So I get it -- not all stations can or will be designed, aligned, laid-out, and sited to maximize TOD.

BUT.

With this new (and perhaps more realistic) attitude, I then went back to work looking to Sound Transit's policies and goals, and the Lynnwood LINK planning and design work. I wanted to understand both the current policies, and where along the Shoreline segment good integration of station & community is being considered, fostered, and can be expected.

here's what I found:

---Last December the ST Board approved and published their official TOD Policy.

---in April, Lynnwood LINK issued its report on TOD potential along the proposed route with the currently proposed stations' conceptual design & siting.

I-083-002

---and now the DEIS has been published, which incorporates in its entirety (I believe) the April TOD report.

In doing this research two things really jumped out at me, and that is what I was trying to question you about at the 185th meeting. In short:

#1.
The sound transit TOD policy says (1st page, 3rd paragraph):

> *".....The legislation also guides Sound Transit to work with public and private interests to facilitate TOD. For example, Sound Transit is guided to work with local jurisdictions to set forth conditions for assuring land uses compatible with development of high-capacity transportation systems, such as providing for sufficient land use densities through local actions in high capacity transit corridors and near passenger stations, preserving transit rights-of-way, and protecting the region's environmental quality. Additionally, the legislation guides the agency, in cooperation with pubic and private interests, to promote transit compatible land uses and development, which includes joint development."*

#2.
The assessment in the April report and the DEIS states that the potential for TOD at the 4 proposed station sites in "segment A" of Lynnwood LINK is:
"limited"(130th); "limited"(145th); "limited"(155th); and "limited-moderate"(185th).
-- and even this last site falls to "limited" if accommodation/agreement is not reached with Shoreline Schools for developing adjacent properties in their control.....

OBSERVATIONS:

It appears that the Lynnwood LINK conceptual design, as described in the DEIS, pretty much completely disregarded Sound Transit's own policy. The development of designs are directed to "*facilitate TOD*" (Sound Transit's words) -- NOT to simply study the issue and then report that, "*nope, not much chance of TOD here...*" (my paraphrase) And regardless of your supposition that 'every station site won't allow for TOD' -- which I do tend to believe is true -- the fact is (as established by Sound Transit's own report), that NONE of the 4 proposed "Segment A" stations allow for appreciable TOD. Moreover, depending on which station sites are selected in segment B (Mountlake Terrace) and segment C (Lynnwood), the potential for TOD at those sites is limited as well.....

I-083-002

Again, I get it that this section of LINK is never going to have the TOD potential of some of the station sites in Seattle. Likewise, I understand that it would be too much to expect that Sound Transit would site, design, and build every one of the Lynnwood LINK stations to maximize TOD potential.

But NONE??

Eight months after Sound Transit publicly commits to a policy of designing its transit projects to encourage and facilitate TOD -- **and the very next project design which is released to the public has little to none**. Why has this project choosen to disregard the Sound Transit board's guidance and directions? I hope you can realize how disappointing and frustrating this is..... and why I am asking questions about this obvious oversight and short-coming of the project as proposed.

At some point in design and scoping -- especially after the Sound Transit board adopted an official policy and commitment to TOD -- there should have been a recognition that the current design was not meeting Sound Transit's own criteria.

So we are now at a point in the process where the public is to comment on the alternatives listed in the DEIS -- and yet the list of alternatives is very obviously incomplete, since no alternatives provide even an average amount of TOD potential. In failing to develop a design which meets Sound Transit's own policies and goals, I find that the DEIS is deeply flawed.

It seems like the lessons learned by Sound Transit a mere ten years have already been forgotten. At that time, the preferred alternative of locating a LINK station alongside the highway at NE 65th was realized to be a mistake --both by the community AND the Sound Transit Board-- simply on the basis of the lack of TOD potential.

No transit station which is sited immediately adjacent to a highway will ever encourage --or even allow for-- effective TOD and integration into the surrounding community. By definition and simply geometry, half of the land adjacent to a station located immediately next to a highway can never be developed, because it is taken up by the highway itself. And then the other half of the the land adjacent to the station will never foster good, valuable, and attractive urban development, because all of that property, by definition, is next to a highway. Shifting the alignment even a block or two makes a world of difference, and that is exactly what Sound Transit choose to do at NE 65th -- even though it meant that the costs of developing that segment are going to be higher.

I-083-002

I understand that it must seem the obvious solution to run LINK along the edge of I-5 from Northgate to Lynnwood -- its simpler, and probably cheaper. But by choosing this 'easy' way, Sound Transit has disregarded what it has already learned about station areas. North of Northgate does not suddenly turn into a rural area, which simply needs to accommodate the passage of a train. Rather than serving the city of Shoreline, and helping to foster transit-oriented neighborhoods within the station areas, the current Lynnwood LINK design is little more than a commuter rail line.

The DEIS, as it is currently written, basically only allows a choice of which type of Park-and-Ride station (at-grade or elevated; where to build the huge parking structure) the public wants to accept. This is not a real choice, and doesn't allow for meaningful public input. The currently proposed station locations and siting don't allow for significant Transit-Oriented-Development, or efficient integration -- and that is exactly what is needed if LINK is to have a consequential positive impact throughout our area.

If the Lynnwood LINK is to truly serve the communities north of Seattle --and to meet the criteria, strategies, policies, and goals set by Sound Transit-- then a re-examination of the project's design is necessary.

Sound Transit needs to be part of creating a transit system, NOT just the builder of a railroad.

regards--

andy

Suzanne Wynne, NE 185th Station-Area Citizens Committee

21 August 2013

Dear Ms. Sowers--

I wanted to 'follow-up' with you a bit.....

Two weeks ago, at the 185th station committee meeting, I was one of the people asking you about the [lack of] TOD potential in the proposed design of the Lynnwood LINK. Previous to that, I had been one of the people asking you similar questions at the 145th station-area visioning meeting the week before.

While it may seem that I keep asking the same questions, I'm not. (though admittedly my questions are certainly closely related). Likewise, regardless of what you may think, I am very much interested in your answers.

I am trying not to repeat myself, but rather to continuing to research and ask questions in hopes of helping me to refine my DEIS comments, so I am focusing on defining the problems in sound transit's conceptual strategy of designing the Lynnwood Link.

In detail, and review:

At the visioning meeting I asked you about better siting/aligning/designing the shoreline stations to maximize and encourage -- or at the very least, ***allow for*** -- good TOD and adjacent "smart growth" urban planning and integration.

[please note, again, that I am in no way asking for re-consideration of a SR99 or N.E. 15th alignment.]

Your reply to me, in part, was that while LINK will try and locate stations where TOD can best happen, not all stations can have this attribute. Different stations can and will serve different purposes.

I have to say that while I might wish that EVERY station area be developed in a "dense, developed TOD" way, I heard what you had to say and I guess it helped me to realize that this is unrealistic. So I get it -- not all stations can or will be designed, aligned, laid-out, and sited to maximize TOD.

BUT.

With this new (and perhaps more realistic) attitude, I then went back to work looking to Sound Transit's policies and goals, and the Lynnwood LINK planning and design work. I wanted to understand both the current policies, and where along the Shoreline segment good integration of station & community is being considered, fostered, and can be expected.

I-090-001 Glad this is finally happening. Wonder if the projection is for increased # of autos on the road come 2020, or even a decrease. How people get around in 2050 I believe will be different than today; less auto, more public transport. Will additional trains be able to be added to track? High speed technology?

I-090-002 Add as many ~~trees~~ trees as possible!

SOUNDTRANSIT RIDE THE WAVE

I-090-001

Thank you for your comment concerning changes in traffic in the future. Analysis of 2020 traffic volumes is not presented in the EIS, however, projected traffic volumes for 2035 with and without the proposed Lynnwood Link Extension project are discussed. See Table 3-7, Screenline Volumes and Volume-to-Capacity Ratios. Comparison of these traffic volumes in this table show a consistent reduction in traffic volumes with the Light Rail Alternative.

Section 2.5.4 Light Rail Operations discusses the planned operation of the light rail service with four-car trains. Train frequency could increase as demand increases.

High-speed technology could not be implemented without complete reconstruction of the rail tracks, station platforms, operating system, as well as the purchase of all new trains. Moreover, operation of a high-speed train system would not be appropriate considering the relatively short distances between the transit stations.

I-090-002

Sound Transit will be meeting the tree replacement requirements of the corridor cities as well as WSDOT.

Comments

I-092-001 IT APPEARS THE GREATEST PHYSICAL IMPACT WILL MORE NOISE ADDED TO THE FREEWAY AND

I-092-002 SURROUNDINGS. THE ADDED IMPACTS TO HOUSING DENSITY AND TRAFFIC WILL BE BOTH A BLESSING AND A BURDEN TO DEAL WITH. WE ARE LARGELY A SINGLE DWELLING NEIGHBORHOOD, FINANCIAL SUSTAINABILITY AFTER INITIAL CONSTRUCTION IS ALLWAYS A PROBLEM 10 YEARS DOWN THE ROAD WE WILL BECOME A REASON FOR ADDITIONAL TAXING OR FEES!

SOUNDTRANSIT RIDE THE WAVE

I-092-001

The noise analysis for the Lynnwood Link Extension uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

I-092-002

The local jurisdictions control zoning and development regulations and policies. Most of the areas along the alignment have relatively limited transit oriented development potential due to the residential character of the neighborhoods surrounding the identified transit stations. The exception would be the area around the Lynnwood Transit Center and the Mountlake Terrace station area both of which would have moderate to strong TOD potential. Sections 4.2.4 and 4.3.4 describe the indirect and secondary impacts for land use and economics, respectively. Section 5.3.1 of the Draft EIS presents the operation and maintenance costs for the Lynnwood Link Extension, which is about $16 million per year.

Comments

I-093-001 After looking at the three options for a parking garage / lot for the 185th station, I strongly suggest that Sound Transit consider the 3-story garage (Option 1) on the west side of I-5. Locating a parking lot under the current power lines would cause a loss of green space

I-093-002 in the neighborhood, require Transit riders to walk a block to get to the station, and seemingly increase traffic on 10th (and quite possibly on 188th and 189th for those people who couldn't find parking). Perhaps introducing neighborhood parking permits?

I-093-003 I would also encourage Sound Transit to work with the city to open up new business opportunities, such as coffee shops or cafe's that would benefit both commuters and neighbors in the area.

SOUNDTRANSIT RIDE THE WAVE

I-093-001

Thank you for stating your preference for Option 1 of the NE 185th Street Station.

I-093-002

The option to introduce neighborhood parking permits to manage the spillover parking is included in mitigation. It would be up to the City of Shoreline to implement a neighborhood parking permit program.

I-093-003

Thank you for your interest in Lynnwood Link Extension and your comment regarding possible commercial development near the 185th Street Station. Commercial uses require allowable zoning and must meet development requirements. The City has developed a subarea plan near the proposed 185th Street Station that may permit some commercial development near the station.

I-095-001

This comment pertains to the Lynnwood Light Rail Link C_1, C_2, and C_3 alternative routes. As a resident of Lynnwood that lives in the residential Single family Neighborhood that is ~~almost~~ directly across from the intended project area. I have determined by looking at the information provided in the DEIS taking special consideration the comparisons of all three routes and the serious impacts to the surrounding residents and wildlife habitat. I find that the C_1 and C_2 alternative routes have a serious and severely negative impact on the neighborhood in and around the light Rail Routes. The C_3 alternative route next to the Freeway I-5 has the least negative impacts on the surrounding neighborhood. I fully support Sound Transit to pursue the C_3 alternative route going into Lynnwood.

SOUNDTRANSIT
RIDE THE WAVE

I-095-001

Thank you for your comment stating your concerns for adverse residential, wildlife habitat, and neighborhood impacts of the Segment C alternatives and your preference for Alternative C3. A modified version of Alternative C3 was identified as the Preferred Alternative.

Comments

I-097-001 Preference would be to build above ground running along westside of freeway into Lynnwood. Option C1 would be the best option & seemingly less evasive on the Landed area near the mall.

I-097-002 Appears that the transit time (b/c Seattle is lessened much & the amount of transfers seems to be high as well.

Currently the community "feeder" buses are slow at best to help service those of us that live along 524 heading east towards Mattby. How can we easily access the light rail system.

SOUNDTRANSIT RIDE THE WAVE

I-097-001

Thank you for your comment stating your preference for Option 2 of Alternative C1. Please see Chapter 2, Section 2.6.2 for a discussion of why west side alignments are not proposed south of Mountlake Terrace.

I-097-002

Thank you for your input. One of the benefits of the project would be to reduce the need for transfers and to reduce waiting times. Sound Transit will work further with local transit agencies to coordinate transit services to stations as the project approaches operation. However, new routes and services are the jurisdiction of local transit agencies. Each of the stations include pedestrian and bicycle improvements.

The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

I-098-001

We are concerned about the removal of trees at the end of our cul-de-sac (where it abuts I-5) The trees are our only current noise barrier. If it is necessary that they are removed, we think a noise wall along I-5 (where the light rail would veer off for C1 and C2 options) would be necessary. Since we already have to deal with the noise from I-5, additional noise would be very unwelcome. Thanks!

SOUNDTRANSIT RIDE THE WAVE

I-098-001

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, if any existing highway noise walls are removed, they will be replaced.

Comments

I-099-001 1) Station locations - position with E-W transit access such as 130th, 145, 185th Northgate - Presently there are no E-W bus routes close to the 155 proposed station

I-099-002 2) Track & sound wall placement needs to be planned in advance so I may start the tree replacement process along the west side of my property to improve the privacy in my back yard.

I-099-003 3) At grade placement needs to be defined in relation to my back yard grade. It currently is about 10 feet below the freeway grade.

I-099-004 4) Make sure comment sections/activities in the future are well documented.

SOUNDTRANSIT RIDE THE WAVE

I-099-001

Your preference for stations at 130th Street, 145th Street, and 185th Street due to east-west transit access is noted.

I-099-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, if any existing highway noise walls are removed, they will be replaced as part of the project. Sound Transit will coordinate with affected property owners as the project continues into final design.

I-099-003

During final design, Sound Transit will coordinate with adjacent property owners where the project would involve construction affecting their parcels.

I-099-004

Documentation of project activities started in 2010 during the alternatives analysis which included a Report and SEPA addendum (Sound Transit, September 2011). The Final EIS includes the public comments to the Draft EIS, and responses to those comments. Chapter 6 describes the opportunities for public input.

Comments

I-100-001

130th Station is critical to knit together Greenwood, Haller Lake, Bitter Lake, Pinehurst, & Lake City into the light rail system.

If 130th is not going to be built - ~~those~~ commuters from ~~Aurora~~ those neighborhoods will 'swamp' the ~~park~~ Northgate transit P&R.

Either Elevated or at grade is fine. Since Northgate is elevated, at 145th will be ~~to~~ elevated (if built), ~~one probably~~ ~~wants~~ we probably don't want an up/down/up effect.

Thank you for having this open house.

SOUNDTRANSIT RIDE THE WAVE

I-100-001

The 130th Station is included as an option being considered in the Final EIS.

August 22, 2013

Sound Transit
Draft EIS Comments c/o Lauren Swift
401 S. Jackson Street
Seattle WA 98104

Dear members of the Sound Transit Board:

I-105-001

I am a member of the Seattle Latvian Lutheran Church.
I provided, without compensation, Architectural Design, Detail Design Drawings, and Structural Analysis for the construction of this Church and Community Center, which was built mostly by voluntary labor in 1971 and was dedicated to the Latvian Community on February 6, 1972.

The Latvian Lutheran Church has been notified prior to the DEIS publication that the property at 11710 - 3rd Avenue NE has been identified as one that Sound Transit may need to partially or fully acquire in order to construct the project under one or more alternatives.

Recognizing the seriousness of how this project may impact the Latvian Lutheran Church and North Seattle Communities, I am proposing for your consideration an option that, when properly executed, will save a number of properties from acquisition in the vicinity of the NE 117th Street.

Attachment A shows the current location of the I-5 lanes in the vicinity of the NE 117th Street. It is obvious that there is a lot more space on the West side of I-5 than on the East side.

To provide needed space for the proposed Sound Transit, the proposed alternative is to re-route locally the I-5 lanes, as needed, to the West in the existing I-5 right-of-way as shown in Attachment B.

I know, it is easier to condemn private property than it is to deal with federal government, but if you feel in your heart that it is worth saving the Latvian Lutheran Church, which is also a Center for the Baltic communities in the NW, I sincerely hope that the Sound Transit Board will give this alternate proposal its utmost consideration.

Thank you very much!

Sincerely,
Edvins Circenis
Property Manager,
Latvian Lutheran Church of Seattle

Edvins Circenis

I-105-001

The Preferred Alternative has been designed to avoid displacing the church. Any major modification to I-5 would be a less effective solution and involves higher levels of construction impacts, property impacts, and higher costs. Refer to Chapter 2 for a description of the Preferred Alternative.

COMMENTS ON LLE BY LYNNWOOD RESIDENT

Linden Clausen
20212 52nd Ave W
Lynnwood, WA
August 21, 2013
Lindenclausen@gmail.com

I-106-001

As a resident home owner, I am concerned that my family's quality of life will be degraded by the LLE, particularly Alternatives C1 and C2. I fear that congestion, noise, and vibration during operation of the link cannot be fully eliminated, only mitigated, and that disruption during the construction phase would be worse.

The EIS shows adverse impacts only near the guideway. Although my house is within that zone, I think it is likely that others will be affected. Chapter 4.7 states that there will be zero impacts after mitigation of noise. The level of disturbance can be lessened, but I feel it is misleading to state that it will be reduced to the point that there are no impacts.

Adding insulation to buildings in the severe noise impact zone is offered as a method of mitigation. As most local homes do not have air conditioning, they need to open their windows for ventilation, especially in warm weather. I think open windows would defeat the purpose of the insulation. Is there consideration of adding air conditioning to insulation as part of noise mitigation?

I-106-001

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. The FTA criteria for noise are based on exterior noise levels and are more stringent than the criteria for traffic. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS. Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, if any existing highway noise walls are removed, they will be replaced as part of the project. For vibration, mitigation measures include track isolation systems, which are effective and typically reduce vibration to below the FTA criteria. Potential mitigation measures for vibrations are described in Section 4.7.7 of the Final EIS. For homes that still have impacts after mitigation, sound insulation may be considered. This form of mitigation can include improvements, such as new or upgraded windows, improved door seals and other measures to maintain low interior noise levels. This package would also include a fresh air circulation system or some form of fresh air exchange.

In terms of congestion, in areas where light rail creates an impact, the project identifies improvements as mitigation that would return local intersections in the area to the same as they would be without the project or better. Please see section 3.6 for potential mitigation measures for local streets and arterials.

While the EIS describes construction impacts, some of which will be unavoidable, the project also identifies mitigation in each of the environmental topic areas in Chapters 3 and 4 to reduce their severity, and construction is not expected to impair people's ability to live, work and conduct their normal activities in the communities along the project. Alternatives C1 and C2, which would be closest to your home, are not the Preferred Alternative.

Comments

I-107-001

- I think the elevated options work best environmentally (less impact on land + movement of people, vehicles, animals). They look nicer as well.

- I like the 3 station alternative of 130th, 155th & 185th rather than 1 station at 145 and another at 185th. For people biking or walking to the station, the 155th option is easier, and will mean that the 185th st. station will not be as packed with people & cars.

SOUNDTRANSIT RIDE THE WAVE

I-107-001

Thank you for your comment stating a preference for the Segment A elevated alternatives with stations at 130th, 155th, and 185th. All of the project alternatives that were in the Draft EIS are included in the Final EIS. However, Sound Transit selected Alternative A1, with some modifications, as part of the Preferred Alternative. This alternative would include stations at 145th Street NE and 185 Street NE. Please see the Chapter 2 of the Final EIS for a description of the Preferred Alternative.

I-108-001 I FAVOR 185TH PARKING OPTION #2 FOR COMPACTNESS/ FOOTPRINT; EASE OF WALKING TO TRAIN; AND POSSIBLE FUTURE EXPANSION OF PARKING TO SURFACE LOT UNDER POWER LINES

I-108-002 PLEASE WORK W/CITIES TO PROVIDE PED/BIKE TRAILS ALONG RAILBED FOR IMPROVED NON-MOTORIZED ACCESS TO STATIONS

SOUNDTRANSIT RIDE THE WAVE

I-108-001

Your comment is acknowledged. All of the project alternatives that were in the Draft EIS are included in the Final EIS. However, Sound Transit has identified its Preferred Alternative for Segment A, which includes a station as described as Option 1 under Alternative A1 in the Draft EIS. After publication of the Final EIS, the Sound Transit Board will select the alternative to be built.

I-108-002

Thank you for the suggestions. Sound Transit has been coordinating with the local agencies to develop pedestrian and bicycle improvements in station areas and along rebuilt streets. A continuous trail along the rail line is not currently included as part of the project, largely due to the constrained right-of-way and the increases costs and impacts that would result.

Comments

Please make me a party of record on all actions

(1) Extend to comment period – Summer, Jewish high holy holidays & start of school is a poor period to solicit comment

(2) Keep all wetland and tree loss in Section A in the Thornton Creek watershed and as "high" in the watershed as possible

(3) Give extra weight to Alternatives that minimize wetland, stream & Tree impacts

(4) Incorporate Low Impact Development into all Alternatives to the maximum amount feasible.

4 communications Regarding Segment A

SOUNDTRANSIT RIDE THE WAVE

I-109-001

I-109-002

I-109-003

I-109-001

Sound Transit does not have a party of record designation for those interested in the project. However, your email address, as given in this comment, has been added to the project's email update list, per this written request. The public comment period for the Draft EIS was for an extended period of 60 days (45 days are required) from July 26, 2013 to September 23, 2013 to allow greater opportunity for public comment.

I-109-002

Thank you. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts to environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure there is no net loss of ecosystem function and acreage as a result of agency projects. The Lynnwood Link Extension would mitigate impacts on ecosystem resources in accordance with the mitigation sequencing requirements established by the Clean Water Act and local Critical Areas Ordinances. If project-specific mitigation is developed for this project, site selection would emphasize a watershed approach. Plans would be developed in cooperation with resource agencies. See section 4.8.6 of the Final EIS for details.

I-109-003

Thank you for your comment. In identifying a Preferred Alternative, the Sound Transit Board considered the information in the Draft EIS, which detailed ecosystem, visual, and other impacts. Sound Transit requires all projects to consider low-impact development (LID) methods as a first choice for stormwater treatment (Design Criteria Manual, July 2012). Section 4.11.9 of the Final EIS describes potential LID approaches the project would consider.

Comments

I-110-001

Given my background in Aging, my environmental values and what we heard at event for Korean Cmty + folks of modest means event I have some concerns about the potential lack of parking garages at both stations. It will encourage people to keep driving. Accelerating shuttle might work better. This idea came up at both of the gatherings my organization put together. I hope we can find a more creative way to get people to the station.

SOUNDTRANSIT RIDE THE WAVE

I-110-001

Multimodal connections to stations will be refined in coordination with partner transit agencies and local jurisdictions in the final design phase of the project. However, the station concepts already in place emphasize a balanced multimodal access plan that includes parking.

Comments

I-111-001 I'm in favor of the A-1 option to go under 185th. Removal of as few trees as possible, and a high noise mitigation wall to reduce noise impacts.

I-111-002 Also — 5th Ave currently has no sidewalk and is very messy in the Rainy months. Would need to sidewalk along 5th Ave from 180th to 185th at a minimum — particularly for safety sake with the increased traffic on 5th that's bound to happen.

SOUNDTRANSIT RIDE THE WAVE

I-111-001

Thank you for your comment. Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, any existing highway noise walls that are removed will be replaced as part of the project.

I-111-002

The current design of the Preferred Alternative includes reconstruction of 5th Avenue NE from NE 185th Street to approximately NE 183rd Court. This would bring the street up to current standards as well, with pedestrian and bicycle facilities, and improved stormwater management.

Comments

I-112-001

At my home in the Ridgecrest Neighborhood, we are currently impacted by a great deal of sound from I5 due to being situated on the east of the hill. I dont see any evaluation being done in regards to sound near my home since we are a good distance from the L.R. line proposals. I would ask for an evaluation to be done prior to the final E.I.S.

I am a big supporter of the plan, and specifically the stop at 145th but I would appreciate some more thought being put into sound impacts at neighborhoods along the east of the hill on 7th & 8th NE.

Thank you.

SOUNDTRANSIT RIDE THE WAVE

I-112-001

Thank your for your comment. Based on the address you supplied, your house is approximately 2100 feet from the light rail alignment. At this distance, it is unlikely that you would hear the light rail system operations, and you are outside the typical analysis range 400 to 600 feet from the corridor. However, sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, any existing highway noise walls removed will be replaced.

Comments

I-114-001 We have concerns about the C1 & C2 options. We feel that the C3 option would cause the least amount of

I-114-002 disruption for us, our neighbors and businesses. We're also concerned ~~about~~ that the noise and aesthetic would cause a significant decrease in our property value.

SOUNDTRANSIT RIDE THE WAVE

I-114-001

Sound Transit developed a modified Alternative C3 for the Preferred Alternative. Please see Chapter 2 of the Final EIS for a description of the Preferred Alternative and its potential effects. A decision about which alternative is built for this project will not be made until after the Final EIS is issued.

I-114-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Section 4.5 analyzes visual impacts, and the areas along 52nd Avenue W were identified as high impact with Alternatives C1 and C2; they are not the Preferred Alternative. Section 4.3.4 also considers the potential for economic impacts to properties along the various alternatives.

TO WHOM IT MAY CONCERN;

I-115-001 | PLEASE SELECT OPTION C-1 FOR THE LINK LIGHT RAIL. I BELIEVE THIS WOULD BE THE BEST SELECTION FOR LYNNWOOD.

THANK YOU,

Ann Gutschewski

Comments

I-116-001

I prefer Segment A alternative A11, with possibly a few changes. I believe there needs to be stations at both 130th and 145th with parking. But the interchange at 130th should also be reconfigured for improved traffic flow. I like that Option 2 at 145th acquires fewer properties than Option 1, and I like that it has kiss-and-ride access.

at 185th I like that the station is elevated & that the garage is closer, but I wish there was a way to acquire fewer properties.

Of the Segment B alternatives I prefer B2A because it includes a station at 220th

will disperse traffic

SOUNDTRANSIT RIDE THE WAVE

I-117-001

IN SECTION B, THE MOUNTLAKE TERRACE TRANSIT CENTER IS THE PREFERRED LOCATION FOR A STATION. IT WILL ENCOURAGE TOD AND WORK BEST WITH FUTURE DEVELOPMENT AND RESULT IN MORE LIGHT RAIL RIDERSHIP, ~~STAND~~ WITH A SAFER, MORE PEDESTRIAN ~~OR~~ FRIENDLY APPROACH.

SOUNDTRANSIT RIDE THE WAVE

I-117-001

The Sound Transit Board has identified Alternative B2, which includes a station at the Mountlake Terrace Transit Center, as the Preferred Alternative for discussion in the Final EIS. Please see the Chapter 2 of the Final EIS for a description of the Preferred Alternative. A decision about which alternative is built for this project will not be made until after the Final EIS is issued.

Comments

I-118-001 My concern is the traffic along 185th, esp. during construction. Right now there is fairly heavy traffic along 185, esp. at rush hours, but also when there

I-118-002 are events at the Shoreline Ctr and the stadium. It is a Major arterial for all emergency vehicles at all times of day and night. there are only a few direct routes between 185th + 175th – Meridian, 5th and 10th. Alternatives will be necessary.

SOUNDTRANSIT RIDE THE WAVE

I-118-001

Mitigation measures for increased traffic congestion as a result of the station construction and operation will be included as part of the project. Refer to Chapter 3, Transportation.

I-118-002

Sound Transit will work with local jurisdictions during detailed construction planning to ensure that emergency vehicle access is maintained. Sound Transit will also coordinate with the City of Shoreline to minimize disruption to traffic flow and multimodal access along NE 175th Street and NE 185 Streets.

Subject: Latvian Community Center

Dear Sound Transit Staff,

I-119-001 I am writing regarding the proposed project affecting the survival of the Latvian Community Center in North Seattle, Washington.

As a Washington State voter, a lawyer, and a concerned Latvian-American, I would like to share a few points to please consider in the assessment of the project.

First, on a personal note, the Latvian Community Center has truly been a fundamental piece of home and an essential component of my years growing up in Seattle. The Latvian Center is as important in my family's history and in my personal experience as any state park, school, or other special memory. For my elderly mother, to this day it is her primary social place of engagement, its importance cannot be overstated for an elderly immigrant community, to have a place to come together in peace to share common language, art shows, music, food, folk dancing, church, and dialogue. Christmas would simply not be complete without the traditional events at the Latvian Center which I have always attended since a young age, including both the Christmas bazaar and also closer to the holiday the traditional candlelight church service, followed by Latvian dinner with the whole community, most of whom dress in traditional Latvian dress. This is a dying culture, and any efforts to preserve this piece of history must be treasured.

As more specific points, please consider the following:

I-119-002 1) A senior representative from the Latvian Community Center should be appointed to serve on the Community Advisory Committee and/or the Business Advisory Committee for the project, to ensure meaningful engagement with the affected community;

2) The project should be a design-bid-build project, rather than a design-build project, to allow for greater public engagement;

I-119-003 3) An engineering assessment must be completed to ensure that the historic/aged structure of the Latvian Community Center can withstand the new proposed route, if it will proceed at close proximity to the center multiple times per day.

All efforts must be made to ensure that this historic structure is preserved, and along with it a beautiful and fragile ethnic community.

Thank you for your time.
Kristina Johnson
8168 Cultus Bay Road
Clinton WA 98236

I-119-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. The Sound Transit Board directed Sound Transit to explore a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions have been maintained, although a small portion of land on the property's edge would be acquired for the Preferred Alternative and other at-grade alternatives. Please see the Final EIS Section 2.5.1 for a description of the refined Segment A alternatives, which all result in reduced impacts on the Church.

I-119-002

Thank you for the suggestions. Sound Transit is committed to working collaboratively with the church and its representatives throughout the project's development. Sound Transit has not established citizen advisory groups or business advisory groups for the project. Sound Transit's contracting approach to the project would not alter the ability of the agency to continue public engagement in the project.

I-119-003

The Final EIS includes an assessment of vibration levels (Section 4.7.3) resulting from the project, and determined that the vibration would be well below thresholds that could result in damage to adjacent structures. The assessment also considered the church as well as nearby residences as vibration-sensitive facilities where occupants could be disturbed by vibration, and identified mitigation measures to avoid vibration levels exceeding FTA criteria.

I-120-001

I believe that the 145th Station will only work if major changes and improvements are done to 145th. Light rail stations should encourage walking & bikeriding. None of this can happen on 145th. It is terrible & this would make it worse. I like 155th better as it connects to already existing expansion of amenities at the area around Central market. It is also closer to the small area at 160th & 5th. Shoreline has an opportunity to begin to make the city interesting and accessible to people who want to live and play. It needs to be walkable. There needs to be opportunity for businesses to thrive with increase in people who come by lightrail & enjoy a "business core" like Othello & Columbia City. The lightrail

SOUNDTRANSIT RIDE THE WAVE

I like 155th. I don't like 145th. Will the Lynnwood Link Light rail & walk to this new community a huge difference there. People (like me) ride the with a 145th station or a vibrant neighborhood.

I-120-001

Thank you for your interest in Lynnwood Link Extension and your comment regarding improvements needed on NE 145th Street and the need for business opportunities near stations. The Preferred Alternative includes biking, walking, and other access improvements in the NE 145th Street Station area. The City of Shoreline developed a subarea plan for the 145th Street Station area, similar to the recently adopted 185th Subarea Plan.

TO WHOM IT MAY CONCERN;

I-121-001 PLEASE SELECT OPTION C-1 FOR THE LINK LIGHT RAIL. I BELIEVE THIS WOULD BE THE BEST SELECTION FOR LYNNWOOD.

THANK YOU,

Chris Kelly

I-122-001

Of the 3 segment alternatives, c3 is obviously the best choice....it has the least impact on existing neighborhoods and businesses. The people that live in the impacted neighborhoods should not have to see their property devalued or lose their homes when there is a perfectly viable alternative that would avoid these consequences.

-Michael Kelly, Lynnwood

1

I-122-001

Your preference for Alternative C3 due to fewer impacts is noted. The Preferred Alternative in the Final EIS includes a modified Alternative C3. The decision about which project will be built will be made after publication of the Final EIS.

Comments

I-124-001 (1) Go with elevated as much as possible, especially at 145th & along Jackson Park

(2) ~~Agree~~ Don't put in all three interim stations .... (130th, 145th, & 155th) seems like it would dilute ridership.

I-124-002 (3) 145th is somewhat of a tangle already for traffic (long left turn waits, trying to get to freeway on ramps, the odd intersection etc) so would favor 130th station, but really like the potential for the bus & rail connections at 145th. Possible to redesign that whole intersection and freeway entrance to make it all safer, no waits for buses, and less time in the left turn lanes.

I-124-003 (4) Glad to see minimal impact to Thornton, and hope there will be some stormwater natural systems associated with the new stations & water quality treatment at wetlands. Please work closely with SPU as you tie into the Thornton drain & conveyance.

SOUNDTRANSIT RIDE THE WAVE

Thanks for the opportunity.

I-124-001

Sound Transit identified a modified Alternative A1 for the Preferred Alternative. The preferred alternative as described in the Final EIS includes a partially elevated guideway in the vicinity of Jackson Park and stations at NE 145th Street and NE 185th Street. The Final EIS also includes an option for a station at NE 130th Street. Please see Chapter 2 of the Final EIS for a description of the Preferred Alternative. The Sound Transit Board will select the alternative to be built after publication of the Final EIS.

I-124-002

Thank you for your comment about traffic concerns on 145th Street. Chapter 3 includes updated information on improvements included in the Preferred Alternative that help reduce traffic impacts in the NE 145th Street Station area.

I-124-003

Thank you for your comment. Sound Transit requires all projects to consider low-impact development (LID) methods as a first choice for stormwater treatment (Design Criteria Manual, July 2012). As summarized in Section 4.11.9 of the Draft EIS, the most common soil group in the project area is Type C, which is predominantly till-type soil that has a low infiltration and high runoff potential, generally not compatible with many LID approaches that require soil to infiltrate. However, some other locations in the project area contain soil Types A and B, which have high to moderate infiltration potential, respectively, and are generally compatible with many types of LID stormwater facilities. Sound Transit will evaluate the feasibility of LID throughout the project area.

Subject: Lynnwood Extension DEIS comments

I-125-001 In the description of a 145th Street Station, I-5 access is mentioned as if this is a positive item for this location. I would think this would be a negative for this location, instead. If anyone uses I-5 to this station, they'd be entering the freeway closer to a different station, so I doubt many people would use I-5 as access. A 155th Street Station, on the other hand, would provide an access point to light rail that is free of freeway congestion. This would set up a freeway/rail separation pairing like we have planned for 175th Street and 185th Street. If it works for northern Shoreline, it should be good for southern Shoreline.

I-125-002 For the potential 130th Street Station, it looks simple enough to flip the station plan to the south side of 130th Street. Doing this, coupled with a station entrance and crosswalk at 127th Street, would greatly increase the walkshed in the Pinehurst neighborhood. In the elevated scheme, the planned parking could then slide south, nearer to the intersection.

I-125-003 At the 117th Street bridge, to me it seems the best solution would be for the tracks to be elevated directly above 1st Avenue, on a structure straddling the street. This way, the existing bridge would not need to be replaced and houses alongside 1st Avenue would not need to be destroyed. Due to the grade change northward, there would be ample space to transition to an at-grade configuration for 130th Street after a high point near the Latvian Church.

Thank you,
Mark Knoke

1

I-125-001

The Chapter 2 descriptions of the NE 145th Street Station does not characterize the access as good because of the I-5 ramps, but rather because NE 145th Street and 5th Avenue are major arterials, and it would serve the communities east and west of I-5. The continued congested conditions on I-5 is expected to discourage patrons from the north from taking longer trips on the freeway when there would be accessible stations closer to their origin or destination.

I-125-002

The option to locate the 130th Street Station to the south side of NE 130th Street was explored by project designers. The freeway ramp configurations and design challenges involved with reconfiguring the ramps resulted in a decision to not move this option forward. The Preferred Alternative includes the option for a future NE 130th Street Station on the north side.

I-125-003

The Draft EIS and Final EIS include a range of alternatives that do or do not involve replacing the 117th Street bridge. The preferred alignment for the guideway would not require reconstruction or modification of the NE 117th Street crossing.

Comments

I-126-001

Shoreline used to be a bedroom community created by the easy commute to downtown Seattle. No more. We are now a city with a small commercial base and under-utilized land. The 185th Shoreline station promises to create higher density housing, a new commercial district, and a more urban Shoreline. Put the parking as close to the station as possible. Build a multi-story parking facility. Rezone the surrounding area to let businesses buy out homeowners (profitably). Build the station to shape the future, rather than remediate the past. We look forward to a more "fun" Shoreline. Banish the boring!

SOUNDTRANSIT
RIDE THE WAVE

I-126-001

Thank you for comment regarding the 185th Street Station. The preferred alternative includes a multi-story parking garage on the west side of I-5 with improved pedestrian access along NE 185th Street across I-5. The City has developed a subarea plan near the proposed 185th Street Station that envisions higher density development near the station. Rezoning is the responsibility of the City of Shoreline and not part of the Lynnwood Link Extension project.

Comments

I-127-001

As an avid walker & cyclist, I'm advocating for a station location @ 155th Street to serve the Ridgecrest neighborhood. A 155th location would allow a greater number of Shoreline residents to access LINK via non-motorized means which best supports ST's policy of reducing carbon emissions. Such a location would also allow for good connecting bus service (east-west) to/from the Central Market/Sears redevelopment zone and provide continuation service to Greenwood Ave off of Westminster. Bike lanes already exist on 155th west of 5th Ave NE and are slated for expansion to the east. In terms of station spacing, a 155th station would fit well with a 130th station for which I also support. Please prioritize those most affected in Shoreline and maximize benefits to our community by considering 155th!

SOUNDTRANSIT RIDE THE WAVE

I-127-001

Your preference for a NE 155th Street Station is noted. Although the station is not part of the Preferred Alternative, all of the stations would feature multimodal access improvements in the station areas. Sound Transit is also coordinating with the City of Shoreline on opportunities to enhance station accessibility.

Comments

I-128-001

I am in the area closest to Segment A on 185th. I like option 1 the most because it preserves the most number of houses and seems to impact less residence. Option 2 is acceptable but offers less opertunity for development around and in the Shoreline center. Option 3 destroys the open space used for hiking, dog walking, and many other activities. It will directy effect my property and will increse air polution. I like the foot bridge over I5. I also prefer the elevated option for the rail because it looks better and displaces less people and will require less property to be purchased.

SOUNDTRANSIT RIDE THE WAVE

I-128-001

Thank you for your comment stating a preference for the 185th Option 1 Station (Alternative A1). Alternative A1 with modifications, was been identified as the Preferred Alternative. The Sound Transit Board will select the project to be built after publication of the Final EIS.

Comments

I-129-001

Option #3 : The parking under the power lines is a concern because of EMF's and the Tolt River water runs underground. Has there been approval by the Seattle Utilities, who maintain the property and the water pumps.

SOUNDTRANSIT RIDE THE WAVE

I-129-001

Parking lots, streets, and recreational trails are constructed regularly under these types of transmission power lines and over water mains. As noted in Section 4.13 there would be no impacts due to electromagnetic fields. If Option 3 were selected in the project to be built, improvements within the limits of the Tolt River water supply easement area would be required to meet Seattle Public Utilities (SPU) design standards, and any such improvements must undergo an SPU design review prior to construction.

Comments

I-131-001 Long time supporter of light rail (grew up on it in New York + Chicago). Glad to see it finally here in Seattle. LONG OVERDUE!

I-131-002 I strongly encourage using the freeway medians for at grade or above grade use of the right of way. Land is already being used for transportation and would not impact land owners adjacent to freeways as delineated in several alternatives. To achieve this in places reduce number of lanes on freeway. You want those people on the train. They won't need their vehicles. Therefore, no need for the pavement. Thanks to the team that put this together.

SOUNDTRANSIT RIDE THE WAVE

I-131-001

Thank you for your comment. Sound Transit appreciates your support.

I-131-002

The proposed rail alignment is primarily sited in existing right of way outside of traffic (i.e. I-5) to avoid operating and safety conflicts. Removing capacity on the freeway in order to construct light rail would greatly worsen congestion and degrade overall transportation system function. Construction impacts would also be much higher. An above-grade alignment would also need to have more space in the median than is available from Northgate to nearly Mountlake Terrace, would conflict with multiple existing bridges/overcrossings, and would lack room for stations.

Section 2.5 of the Final EIS explains the factors affecting the range of alternatives. The factors reflect the constraints posed by I-5 and its limited available right-of-way, as well as other community and environmental conditions along the project corridor. In addition, refer to the I-5 Light Rail Compatibility Report (Sound Transit 2012, included as Appendix Q of the Final EIS) which is the basis for the conceptual engineering of the Draft EIS alternatives and their assumptions about the use of WSDOT right-of-way.

Comments

I-133-001

Link and the Lynnwood Extension are vital to giving the region an effective alternative to driving. The most important criteria for station siting is proximity to neighborhood centers, bus/bike/pedestrian access, and TOD opportunities.

130th station is vital, so alternatives A5 or A10 are best. 130th is necessary to give Lake City and northwest Seattle effective access to Link via a feeder bus, which would also connect those two areas together. We don't need the elevation of A7 and A11 because there are no traffic crossings to eliminate or spectacular views to see, so save money and build at-grade.

It's hard to choose between 145th and 155th, but 155th is slightly better due to being a pedestrian-friendly street

SOUNDTRANSIT RIDE THE WAVE

I-133-001

Your comment regarding the benefits of stations at NE 130th and 155th Streets is noted. Consistent with the Sound Transit Board's direction for a Preferred Alternative, the Final EIS includes an option for a station at the NE 130th Street.

BY EMAIL: LynnwoodLinkDEIS@soundtransit.org

BY MAIL: Sound Transit
Draft EIS Comments c/o Lauren Swift
401 S. Jackson St., Seattle, WA 98104

I-133-001 (continued) Without traffic congestion, and fewer major parcels that would block upzoning, and being closer to the 185th & Aurora Center and existing crosstown bus 330 there.

I-133-002 Mountlake Terrace station must be on the east side of the freeway to facilitate transfers to buses and a shorter walk to the city center. 220th station may be a good idea if Snohomish County residents support it. So either B2, B2A, or B4 would be OK.

I-133-003 Lynnwood station should be on the north or west side of the transit center to give a shorter walk to the emerging urban village, so C1 or C2 are OK. C3 is bad because it's the longest walk from the park & ride and I-5 being sandwiched between the park & ride and the city center and has no immediate walkshed.

~~There are those who have objections~~

I-133-004 Do not allow concerns about impacts to Scriber Lake Park or the Latvian Center to stand in the way of effective transit for hundreds of thousands of non-drivers and would-be non-drivers in the region. This is our best and only hope to have effective rapid transit in the region. So we must think long-term.

Thank you for your input!

Your preference for Alternative B2, B2A, or B4 is noted. The Sound Transit Board has identified Alternative B2 as the Preferred Alternative. The Preferred Alternative as discussed in the Final EIS includes a station on the east side of I-5 at the Mountlake Terrace Transit Center and further considers an option for a station at 220 Street SW. Please see Chapter 2 of the Final EIS for a description of the Preferred Alternative.

I-133-003

Thank you for describing your concerns about walkability with Alternative C3, which led to your preference for Alternatives C1 and C2. The Sound Transit Board has identified a modified Alternative C3 as the Preferred Alternative. Please see Chapter 2 of the Final EIS for a description of the Preferred Alternative.

I-136-001

My family moved to the Seattle area in 1987 and our family became the Caretakers of the Latvian Lutheran Church. We grew up attending Latvian School, going to Latvian folk dancing, helping w/ senior citizen lunches, going to Latvian Bazaars and other numerous activities. This is the life of a Latvian-American child and continues into adulthood. By building this light rail system, you affect the senior community that built this center by hand w/ ~~donations~~ donations collected over 40 yrs ago. You affect my age group who is now bringing their children to school and continuing the culture — you are affecting the future Latvian children, as well as our fellow Estonian and Lithuanian members who also share our center. We have had to move before due to imminent domain — please do not make us move again — we will not find a "home" that carries the significance of this center. Sincerely, Diana Petersons

SOUNDTRANSIT RIDE THE WAVE

The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE, which avoids the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property. Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A.

I-137-001 We are the caretakers at the Latvian Lutheran Church. We are originally from Milwaukee WI. Every major city in America has a Latvian community center. Most of the centers were built by the "greatest generation". We noticed that when we took over the center, unlike other centers, there is the whole west coast Latvian community that uses the church and center. Not just the city of Seattle.

I-137-002 To resolve the issue with no major hassles and a devastated Baltic community, shorten the 130th street exit. It's silly to have such a long exit lane. Go see for yourself, just move the rail over 50' and shorten the lane. It would work, if we use a "common sense" solution.

Thank you.

I-138-001

The significance of the Latvian Luth. Church of Seattle to the Baltic Community ~~xxx~~ is undescribable. The devastation between 3 cultures and the loss of their church is too much to bear. I really hope that Sound Transit provides a different approach to building the link rail from Northgate to Lynnwood rather than running through the church parking lot creating little to NO access. Please consider that you're not just demolishing a church but 3 Baltic communities.

Latvia, Lithuania, Estonia !!!

Roger Iwata
North Community Outreach Lead
Sound Transit

August 24, 2013

Dear Mr. Iwata:

Re: Sound Transit Link Light Rail system impacting the Seattle Latvian Church and Center at 11710 3rd Ave N.E, Seattle, WA 98125

The purpose of this letter is to voice concerns over the plans for the Lynnwood Link Extension of the Sound Transit Link Light Rail system, which includes alignment along the east side of I-5, impacting private property owners and community groups.

I-141-001

The primary concern is the proposed extension and alignment onto the property of the Seattle Latvian Center, which could potentially limit or completely eliminate street access to the Center's parking lot, cutting off access by Center users and rendering it unusable. The church and center is a custom built and planned facility for the Seattle Latvian community which includes a church, full service kitchen, school rooms, library, and the main hall area which includes a stage. This structure is utilized by the Seattle Latvian, Estonian, and Lithuanian communities for religious functions, community events, family gatherings, birthdays, baptisms, confirmations, end of life ceremonies, and extended to the Seattle community through rental opportunities. Weekly usage of the center includes but is not limited to, church services, folk dance practices, choir rehearsals, Latvian school classes as well as other special interest groups.

The Seattle Latvian community is not only active within the city of Seattle, but also on a national and international level, most recently having taken part in the Latvian Song and Dance Festival in Riga, Latvia. Collectively, they have contributed to the culture of the city on a continuous basis at such events as the Folklife festival and the Baltic Rights of Spring performance at the Seattle Public Library. The American Latvian Association recently held their annual Congress meeting in Kent.

Having spent many years of my childhood at this center it is considered a second home and the growth place of my Latvian heritage. Many Saturdays were spent at the Latvian school learning about culture and language while my other friends watched Saturday cartoons. Sundays were the day for attending church and folk dance rehearsal, both which were and still are located at the center. I was baptized and confirmed at the center as were other Latvian community youth.

Loss of this center would be an irreparable setback for all involved communities. The current center was built after the first Seattle Latvian Center in Tacoma was claimed by Eminent Domain for an I-5 expansion project in the 1970s. The Latvian community would be hard pressed to repeat this relocation effort in the current economic, real estate climate.

The Link Light Rail system is a much needed improvement in the Seattle area and should be celebrated for connecting communities and improving Seattle's access to the areas many cultural, recreational, and business uses. This project should enhance, not threaten the existence of this sort of community center.

Please take the Seattle Latvian Center and Lutheran Church in to consideration as Sound Transit continues plans for its Lynnwood Link Extension and work with them to come to a solution that works for both parties.

Thank you,

Aldis Raisters

Comments

I-142-001

This comment is in regards to the Latvian Lutheran Church property. I am concerned that the headlights of the trains, if the elevated option is chosen, will shine in the north & east facing windows during evening services. Since the trains will come every 4-10 minutes this means services will be disrupted 3-7 times. What are options to mitigate light "pollution" from the trains?

SOUNDTRANSIT RIDE THE WAVE

I-142-001

Additional discussion of headlight impacts of light rail trains has been added to the Final EIS, Section 4.5. For the Latvian Evangelical Lutheran Church, the orientation of the route is roughly parallel to and approximately 50 feet from the nearest building and the focus of headlights on the rails will limit the potential for headlights to shine directly into church windows. In addition, noise walls are currently planned between the light rail line and the church; see Appendix G Figure G-17 for a photosimulation of the Preferred Alternative, looking from the church grounds.

I-143-001

It is not acceptable to me that any part of Latvian Lutheran Church property is taken by Sound Transit. The church and community center was built in 1970-71 by volunteers and donated money (no tax payer funds!) My father, Alfreds Rozenis, was one of the volunteers - workers with 400+ hours. My sons were christened, went to Latvian School and danced in Trejdeksmitas (Treydance at Folklife Festival, Seattle Library, Nordic Museum) for many years. Now their children are attending Latvian School and my niece is still dancing in Trejdeksmitas. I have been active in church but especially in Embroidery group for last 20 years. We meet on Monday and Saturday every other week. Our hand work support the Latvian Center. I go to the Latvian Church/ Community every week for some activity.

To: Iwata, Roger; Lynnwood Link DEIS
Cc: Tami Johnson; sonia glenn
Subject: Comments regarding August 20,2013 Northgate Community Meeting

Hello Mr. Roger Iwata,

My name is Wyvonne Ray. I live in the Northgate area and spoke with you at the Northgate Community Center August 20, 2013 to discuss the LLE project.
My address is 12045 5th Avenue NE, Seattle Wa. 98125. During the discussion you mentioned that my home would be considered a "partial acquisition" versus a full acquisition.

I-144-001 I have the following concerns and would like your feed back addressing my concerns at your earliest convenience:
1. A partial acquisition will not be an option due to the retaining wall being pushed-moved to close to my home, needing to remove my current garage structure and trees.

I-144-002 2. Increase noise and vibrations leading to Insomnia due to having the new LLE in place 24/7 in the Northgate area.

I-144-003 3. Devaluation of my current home and property. No one would be interested in buying a home this close to a light rail system. I would not be interested if I was a potential buyer.

I-144-004 If you are interested in obtaining my home and property to complete the LLE, I would be open to discussing a "full acquisition" proposal.

Best Regards,

Wyvonne Ray
12045 5th Ave NE
Seattle WA 98125
206-679-9138

1

I-144-001

Thank you for your comment. Final determinations of the property needs for the project, including acquisitions (full or partial) and displacements, will be based on the project's final design after Sound Transit completes the EIS process, selects the alternative to be built, and develops final engineering and design plans. Sound Transit policy provides for a fair and equitable means of addressing real property impacts across its projects. Sound Transit is available to answer questions and provide additional information about the acquisition and relocation process, so please feel free to contact the Lynnwood Link Extension project outreach staff member, Roger Iwata at: roger.iwata@soundtransit.org.

I-144-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS. Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. Mitigation is also proposed to address vibration for your property, as discussed in the Noise and Vibration Technical Report, Chapter 5.

I-144-003

Section 4.3.4 of the Draft EIS acknowledges that some studies have documented decreased property values, particularly along a light rail route rather than in the vicinity of a station. Other studies have shown increases in the value of some properties on or near rail alignments. Negative impacts on property values would most likely occur when the light rail project results in noise and visual impacts noticeably greater than what currently exists. At your property, the alignment would be in a retained cut, which would lessen the potential for visual impacts. Noise impacts would be mitigated as described above.

I-144-004

Your preference for a full acquisition proposal has been noted. Please see the Final EIS for the current proposed list of potentially affected properties. However, Sound Transit will not finalize which properties will be full or partial acquisitions until final design, which is after the environmental review process is complete and after Sound Transit has selected the alternative to be built. Please contact Sound Transit for further discussion of your property.

Subject: Support to save the Latvian Community Center

Hello,

I-146-001

I wanted to add my voice to urge you to consider alternate routes for the Sound Transit light rail Lynwood extension that would preserve the Latvian Lutheran Church and community center. This building has been a part of my and my family's lives for decades, and has served as a link for Latvian Americans in Seattle and the entire West Coast. I went to church, Latvian saturday school, and had my wedding reception in that building. My children now go to Latvian school in that building to preserve our family language and traditions and we often attend the church services. This building is so meaningful to so many people, and it continues to thrive and provide a space where a cultural group is able to keep family & cultural traditions alive. It is also a church, place or worship, and school. It also serves as an essential location that brings together Estonian and Lithuanian families who live in this area. My grandmother's generation, who came to this country in exile, worked SO HARD to build this building and community in order to preserve their traditions and language, and it is working. It would absolutely not be right to take that away.

I also absolutely love the fact that more public transportation is being built and certainly do not think this project should not happen, just that it needs to be done so that important cultural sites that have such meaning to such a large community are not impacted.

Thank you!

Sonja Olson
Seattle, WA

Comments

I-147-002

Where I live the address shows my house is (orange color) severe noise impact Requiring mitigation after the rail is finish and we find the noise is to high for us. I understand we might able to have extra insulation to help with the noise. But how about summer time. We have our windows open. deck sliding door open all the time during summer and other times. cause I like my house have air flow. that means insulation in summer while not help with the noise. Do you have other option for us? or we have to suffer with the noise during the summer time?? thank you for your time.

I-147-003

(We) I am not against the light rail. I believe will help with the traffic. and hope the enviorment around the trainsit will be more beautiful. Welcome more and out more green.

SOUNDTRANSIT RIDE THE WAVE

I-147-001

Thank you for your comment stating your preference for Alternative C3.

I-147-002

The Preferred Alternative evaluated in the Final EIS is a modified version of Alternative C3, which would not be located near your residence. If Alternative C1 or C2 were constructed, there would be a noise wall along the entire elevated structure from I-5 to the Lynnwood Transit Center Station, so your residence would be protected from noise by noise walls.

I-147-003

Thank you for the support. Sound Transit appreciates your comments.

Re:
PLEASE SAVE THE LATVIAN CENTER!!

Dear Sir or Madam:

I-148-001

I am writing today to express my concerns over the planned light rail extension to Lynnwood... specifically how this project is going to impact our community's church and cultural center next to I-5 near 117th and 3rd. This building is a HUB to our community – a landmark and monument to an immigrant community who designed, financed, and built it themselves, and it is imperative that it be allowed to continue its function as it is, where it is.

I am a member of the local Latvian-American community. I was born in Edmonds, WA. I represent the second generation of my family to be born outside of Latvia.

My grandparents were forced to flee Latvia during the Second World War when Soviet Russia invaded the Baltics for the second and final time of that conflict. Like so many in their generation, they fled to Germany to await paperwork to immigrate to a new land to seek a better life for their families.

1

I-148-001

The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE, which avoids the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property. Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A.

With little-to-nothing to their names they finally arrived in America and began to start a new life, from scratch. Through hard, honest work and an incredible community of other Latvians joining together, they not only survived but thrived, and in the 1950's the community purchased a church. Not 10 years later the city claimed this church as eminent domain, and our community again came together to start from scratch.

On a new piece of land the Latvian community together designed, financed, and constructed the Latvian Lutheran Evangelical Church and Community Center as we know it today. This building may be listed as a "church" in Sound Transit documentation… but it is so incredibly much more to the communities it serves.

This building is the HUB of not only the Latvian, but also the local Estonian and Lithuanian communities with reach as far away as Alaska, California, and well into central US and Canada. This building has been the home of the Seattle Latvian School for over 50 years… a school I myself attended as a child and where my children will be returning in September to continue their studies. This building has been the rehearsal and performance space for the local Latvian folkdance group "Trejdeksnitis" for just as long… a folkdance group where my parents met and fell in love, and also where my wife and I danced when we were younger. The Latvian Center acts as the official polling place for Latvian, Lithuanian, and Estonian elections to serve citizens of those countries who reside in our region. The Center also hosts countless academic society functions, weekly choir rehearsals, community weddings and celebrations, art exhibits, musical performances, plays… the list goes on and on. The presence of this center has also been instrumental in the establishment and perseverance of the Baltic Studies program at the University of Washington, and is a meeting place and home to many Baltic organizations with charitable missions both domestic and abroad.

And yes, it is also a church which offers services regularly in the native languages of Latvia, Lithuania, and Estonia. A church where my father and I both were confirmed, the church where I was christened, the church where I have seen countless friends and family wed, and the church where I've bid a final farewell to several others.

It is imperative that this building face minimal impact from the Sound Transit expansion to Lynnwood… both during construction and after completion. Elimination of the Latvian Center for Sound Transit expansion CAN NOT be considered in your construction plans. The loss to our communities would be completely devastating.

This building is priceless to our communities, and it just CAN NOT be replaced or substituted or adequately compensated for!

I implore the decision-makers at Sound Transit…

PLEASE PRESERVE THE LATVIAN CENTER!

Thank you for your time and consideration.

Sincerely,

Valdis J. Riekstins

I-149-001

I am extremely concerned about the impact this ST extension project will have on the Latvian church & community center near 117th & 3rd.

This building is a living landmark to the community that designed, financed, and built this structure. It serves our community as so much more than just a house of religion. It is the HUB of our baltic communities here in the pacific NW.

Any impact the extension project will have on our center must be minimized!

SOUNDTRANSIT RIDE THE WAVE

over →

I-149-001

The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE, which avoids the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property. Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods.

I support Light Rail. I work for HMM on the U-Link project. I am Latvian. I helped build the Latvian church and Community Center. We lost our ~~1st~~ first community center to City of Seattle for a park. This center is the cultural hub for the Baltic community. It is used by many people for various functions through out the year. I believe we are adaptable. We can live with change. We do not want to lose our gathering place. We do not want to lose our constant. Please make it happen.

SOUNDTRANSIT RIDE THE WAVE

I-150-001

The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE, which avoids the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Comments

I-153-001

Where our house is located, ~~and~~ we are concerned that the value of our home will be greatly depreciated by either option 1 or option 2 of the station choice at NE 145th St. This same concern exists relative to the link line going through our neighborhood. Other concerns are

I-153-002

with a parking structure across the street, we would have more:

- cars in & out of the garage (in option 1 directly across our driveway
  - * lights in our windows all the time
  - * traffic (500-650 movements twice a day)
  - x privacy
  - x pedestrians increase
  - x bicycles
  - * exhaust emissions
  - x litter
  - x crime
  - * security
  - * homeless people

I-153-003

- noise from the station signals 20 hrs/day
- relocated ramp would move noise from accelerating traffic on on ramp

I'm sure we have many more concerns but our biggest is the devaluation of our property value

SOUNDTRANSIT RIDE THE WAVE

I-153-001

As discussed in Section 4.3.4 of the Draft EIS, improved transit access along with other amenities such as street improvements, including sidewalks and landscaping can positively affect the convenience, visibility, and desirability of surrounding residential properties. Sounds walls needed for the light rail project also have the potential to lower traffic noise from I-5 in the area. The discussion cites research showing that station areas can see increases in property values, but it also notes other factors such as general neighborhood conditions, overall market forces, and local government planning policies as also being important determiners of value. However, the Preferred Alternative features Alternative 3 Option 2 for the NE 145th Street Station parking garage, which would place the parking garage one block south of NE 148th Street.

I-153-002

Sound Transit works with local jurisdictions during final design of stations and park-and-ride garages to integrate them into the surrounding neighborhood and alleviate/minimize their adverse impacts. As noted above, the project would include street and sidewalk improvements, landscaping, lighting, and other amenities. Visual effects are discussed in Section 4.5, with mitigation described in Section 4.5.6. The project features intersection and street improvements to help alleviate congestion, as discussed in Chapter 3, Section 3.2.4. The potential for safety and security impacts is addressed in Section 4.14 and emissions are addressed in Section 4.6, but no adverse impacts are anticipated. There would be increased activity in the station area, including pedestrians and bicyclists, but increased levels of activity can have a positive effect on safety and security. Sound Transit also would maintain the stations to be clean and sanitary, with active surveillance systems that include security personnel and coordination with local police, fire, and other emergency service providers.

I-153-003

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

I-154-001 at 185th the parking is Not going to keep up with Demand. I Lived in Cal. F. and have Seen the Caos around the stations with Cars parked For Blocks around on the once quiet residential streets. I Feel my propesty

I-154-002 Value will Drop Because of this Parking with the Homeowness Being very unhappy with Cars Flooding once quiet streets. also my

I-154-003 Back yard Faces west and I don't really want to See trains going By every 10 Minutes

I-154-004 will the City have to set up Parking Zones For residents on is street Parking gone For us?

SOUNDTRANSIT RIDE THE WAVE

I-154-001

See Section 3.6.7 for mitigation measures to address the potential for spillover parking in neighborhoods.

I-154-002

Section 4.3.4 describes the potential effects of the project on property values. The discussion cites research showing that station areas can see increases in property values, but it also notes other factors such as general neighborhood conditions, overall market forces, and local government planning policies as also being important determiners of value. Improved transit access at the station, along with other amenities, such as street improvements, including sidewalks and landscaping, can positively affect the convenience, visibility, and desirability of surrounding residential properties. Noise walls needed for the light rail project also have the potential to lower traffic noise from I-5 in the area.

I-154-003

Sound Transit acknowledges your concern about seeing trains pass by your backyard. In this location, the alignment of the light rail is just east of I-5 some distance from your home. Also, there would be noise walls along this section of the alignment, which would shield the passing train from residences on the east side of the alignment.

Text has been added to Section 4.5 in the Final EIS describing the visual effects of trains passing periodically.

I-154-004

The City could consider parking zones or other measures as described in Section 3.6.7 of the Final EIS.

I-155-001

Proposal N.E. 185th ST. station - Option 1 appears to be the most efficient option because it has the least impact on the neighborhood while it meets the objectives of a 500 space parking garage and an at grade station which will reduce noise & sight impact. My family as well as a majority of our neighbors prefer the N.E. 185th ST. station - Option 1.

Thank You.

SOUNDTRANSIT RIDE THE WAVE

I-156-001

My vote is for overhead rail not ground level - lived in this house for 38 years - wife has "MS" House is handicap ready we need to stay - Thank you.

SOUNDTRANSIT RIDE THE WAVE

I-156-001

Thank you for your comment stating a preference for elevated rail as opposed to ground-level. Sound Transit recognizes your concern for maintaining your current residential location, with its specific handicap renovations. The Final EIS identifies properties affected by potential acquisitions in Appendix I-4.1. Sound Transit policy provides for a fair and equitable means of addressing real property impacts across its projects, and this includes a commitment to provide replacement structures in a manner consistent with state and federal law. This policy has been successfully implemented on several of the Link lines already. While Sound Transit will endeavor to relocate displaced parties in the same neighborhood or area, the work is done in consultation with the displaced parties, who may or may not choose to stay in the same area. They will, however, be placed in structures that remain affordable to and compatible with them; this effort includes interviews with the affected parties to help determine affordability and compatibility, as well as compensation and assistance programs that meet individualized needs and ensures safe and sanitary structures.

Comments

I-157-001

I am concerned about the parking lots around the proposed 185th St Station. I would prefer the SCL right-of-way remain a green space. Building a parking lot west of I-5 (option 1?) would create long range opportunities to build a LID over I-5 potentially reducing noise and increase opportunities for walkable space and unique neighborhood character.

Please introduce neighborhood parking permits so local ~~rest~~ residents can have a place to park on the street or recieve guests.

SOUNDTRANSIT RIDE THE WAVE

I-157-001

Thank you for stating your preference for the garage site in 185th Street Station Option 1. The Preferred Alternative features a parking garage west of the station at NE 185th Street. See Section 3.6.7 for Sound Transit's proposed mitigation approach to address potential parking impacts on neighborhood streets.

Comments

I-159-001

Prefer 145th over 155th — worked on Shoreline subarea plan for 2 years, where we addressed issues of 145th → it needs to be addressed no matter what in terms of current issues — 155th is currently a stable residential area — why disrupt it !!?

— also would have preferred 205th over mid-Mountlake Terrace station — just seems more sensible

SOUNDTRANSIT RIDE THE WAVE

I-159-001

Thank you for your comment stating your preference in Segment A for a light rail transit station at NE 145th Street and not at NE 155th Street. The Mountlake Terrace Transit Center Station maximizes previous infrastructure investments that anticipated light rail serving the area.

Comments

I-160-001

I am very concerned about traffic and parking in the neighborhood during construction and after. 185th is busy enough now and will only get worse. More cars, more people - a big impact on the surrounding streets. Are we going the way of neighborhood parking stickers - zone parking - like in Seattle?

SOUNDTRANSIT RIDE THE WAVE

I-160-001

Your comment regarding traffic and parking impact concerns is noted. Although special parking management strategies will be selected by local jurisdictions, Sound Transit identifies potential measures to mitigate potential parking impacts in neighborhoods in Section 3.6.7; measures could include neighborhood parking restrictions but would ultimately be decided through a city-managed process. For an updated assessment of operational traffic impacts and associated improvements, please see Section 3.2.4. See Section 3.3 for construction impacts, and 3.6.9 for construction period mitigation.

~~After~~ During and after WWII Latvians were prevented from and prosecuted for celebrating their heritage & speaking their language and maintaining their national identity. For those Latvians that fled the country for Departed Persons refugee camps in Germany and later for countries such as the US that would accept them, preserving language and cultural heritage became very important. Continuing to do so remains important to us and we have to have a place to come together. The threat to our church/hall hits close to home and reactivates old fears around losing track of who we are. Eliminating our building or cutting off access is an unacceptable product of the Lynnwood Extension

SOUNDTRANSIT RIDE THE WAVE

I-166-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE which avoids the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

I-167-001

The Latvian Lutheran Evangelical Church and Community Center is ~~a~~ the center for Baltic activities in Seattle, Washington and the North-west. It is also part of a larger network of Latvian Churches and Centers in the United States. We cannot function as a community without this facility. Elimination of the property is unacceptable and interference, during construction, with our cultural and religious activities would also be damaging to our community. Our cultural identity must be considered and respected as Sound Transit plans for the Lynnwood Link Extension.

The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

I-168-001 Comments LYNNWOOD (C1, C2, C3) TO FINAL STATEMENT:
ADD to Earthquake / Engineering Designs especially in wetlands

I-168-002 o Noice Issues especially on curves ( ) Plus wear & tear on the rails better solved by keeping line fairly STRAIGHT (C-3)

I-168-003 o Wildlife Habitat — need less Loss (C-3) Best

I-168-004 o Residences Loss (C-1) 77 units / (C-2) 3 units / (C-3) 0

o Business Dislocation (C-1) 33 / (C-2) 2 / C-3 1

I-168-005 o Photographs AT KEY LOCATIONS to FINAL STATEMENT

I-168-006 o Tree Buffer for Noice IMPORTANT DESIGN

PERSONAL: WALK THE ROUTE: PERSONAL KNOWLEDGE

I-168-007 DETAIL MAPS & DESIGN similar aerial overhead map displayed and ADD key land marks USE: Before & After ILLUSTRATIONS AT LOCATIONS

I-168-008 PREFER: C-3 Less Impact Residents, Business, Wildlife and Wear & Tear On Line. Besides I LIVE HERE!! (C-1)

SOUNDTRANSIT RIDE THE WAVE

I-168-001

The Draft EIS and Final EIS include a summary of the geologic hazards that have been identified in the project areas. The project design will address identified geologic hazards (including hazards from wetland soils at Scriber Creek), and will include earthquake engineering in accordance with applicable building codes. The earthquake engineering includes evaluations of and design for ground shaking, liquefaction, lateral spread, liquefaction-induced settlement, and seismically-induced slope instability. See Section 4.11 of the Final EIS, and Appendix I-4.11 for further details.

I-168-002

The noise analysis for the Lynnwood Link Extension uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Wheel squeal only occurs on tight radius curves, not on a tangent track, like the ones along this segment of the corridor. For areas with tight radius curves, trackside lubrication will be used to mitigate wheel squeal. See Section 4.8 of the Final EIS for further details.

I-168-003

This project will abide by all applicable federal, state, and local environmental laws and regulations. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects.

I-168-004

Sound Transit notes your comments regarding potential acquisitions related to the alternatives in Segment C. Since the publication of the Draft EIS, Sound Transit has modified some of the alternatives and has

identified a Preferred Alternative, which has no residential displacements in Lynnwood but still displaces several businesses.

I-168-005

Photographs at key locations together with visual simulations of alternatives have been provided in Appendix G to the Draft EIS. These include 45 locations chosen to illustrate typical design features and impacts as well as specific features where potential visual impacts are high.

I-168-006

Foliage, if dense, can provide slight reductions in noise levels. The FTA and FHWA provides for up to a 3 dBA reduction in transportation noise for locations with at least 100 feet of dense foliage that contains leaves year around. Because of the varying foliage in the project area, no reduction for foliage will be used in the analysis. Also, a 3 dB reduction in noise level is barely perceptible to most people, so foliage in virtually all areas of this project corridor will have little overall effect on light rail nor traffic noise.

I-168-007

Appendix F provides conceptual designs with more detail/scale. The EIS maps are designed to assist readers in identifying areas with potential impacts; depending on the topic (i.e., neighborhoods or parks), more detail is shown.

I-168-008

Thank you for your comment stating your preference for Alternative C3.

Comments

I-169-001

Strongly favor (130th + 155th) vs 145th Station locations for the following reasons:

Benefits of 155th

(1) Excellent tie-in with City of Shoreline development on 99 & 155th - especially bike access from 99 to 155

(2) A slower paced area, but still close enough. Feeder By bus would work very well - and the younger generation will be looking for feeder buses - not a parking space.

Negatives of 145th

(1) 145th is an extremely busy throughway. No-one will ever walk or ride a bike on 145th. Too much noise and pollution. Very ugly

(2) Gigantic traffic jams every single day at 145th & I-5. Would kill feeder bus access.

SOUNDTRANSIT RIDE THE WAVE

I-169-001

Thank you for your comment stating your strong preference for a light rail transit station at NE 130th Street and NE 155th Street and the reasons why you support these stations over one at NE 145th Street.

Comments

I-170-001 (1) I Want to be informed if NE 145th street OR NE 155th street be selected as a station when a decision had make.

(2) How is the station be build? Will it be elevated or not?

I-170-002 (3) Do N.E. 157 Street has ~~Sound~~ Sound Wall or retainer Wall built?

SOUNDTRANSIT RIDE THE WAVE

I-170-001

Thank you for your comment stating your interest in the construction of light rail transit stations at either NE 145th Street or NE 155th Street. Stations at both of these locations, including two layout options at NE 145th Street, would be elevated to go over either the northbound I-5 on-ramp or NE 155th Street. A final decision by the Sound Transit Board will be made following the publication of the Final EIS. Chapter 2 provides an overview of construction, but details of construction methods will depend on the final design and the contractor's approach.

I-170-002

Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, any existing WSDOT noise walls removed as part of the project will be replaced.

Comments

I-171-001

I am looking forward to light rail extending from Lynnwood to Seattle - and north to Everett.

Understanding that some property owners will be impacted no matter which alternative is selected, C3 - the station closest to I-5 and with the least impact on the community resources; homes crossed by C1 & C2 - is my preference. Keeping the route as streamlined as possible makes the most sense to me.

Thank you for moving this forward, whatever the solution.

SOUNDTRANSIT RIDE THE WAVE

I-171-001

Thank you for your comment stating your overall support of the Lynnwood Link Extension project and the proposal to ultimately extend the light rail system to Everett. Sound Transit also thanks you for stating your prefrence for Alternative C3.

WHEN THE ~~A~~ AIRPORT TRAIN PASSES, IT MAKES A HIGH-PITCHED SOUND IN MY 2009 CAR RADIO. I AM CONCERNED ABOUT A SIMILAR SOUND OR OTHER INTERFERENCE IN OUR CHURCH SOUND SYSTEM OR OTHER ELECTRONIC EQUIPMENT ~~AS~~ SUCH AS WI-FI IN THE BUILDING.

SOUNDTRANSIT
RIDE THE WAVE

I-172-001

Some people have reported brief interference with their car radios as the light rail train passes, but this is not a common occurrence for light rail systems. WiFi interference would not be a problem because the frequencies are different.

August 23, 2013

TO: SOUND TRANSIT
DRAFT EIS COMMENTS c/o LAUREN SWIFT
401 SOUTH JACKSON STREET
SEATTLE WA 98104

I-173-001

I attended the open house at Northgate Community Center August 21 and spoke on the Lynnwood Link Extension EIS.

I received a copy of the Summary DEIS which had some cost information in it after I spoke. The eight page handout at the sign-in desk had none.

I-173-002

Basically, my comments were that rail transit should not require a car to use and that stations should be at transit hubs and major destinations with minimum walking required- unlike the airport station which is as far away as possible from the terminal(on the far side of the parking garage).

Parking garages should be minimized, allocated to the highway budget not the rail budget. It looks like the garages cut the rail by 50%. Handicapped, young, elderly and poor need public transit. Tax dollars and debt should be used to make the system usable without a car.

I-173-003

See the CCC process that regional government was supposed to use coordinate all transportation and utility spending. The Bogue Plan of Seattle (1911) did that and the History of the Port of Seattle by Burke and Seattle Citizens Against Freeways by Tunks told how it was done since then. Excerpts from the two books are attached.

Hopefully the oil/asphalt/war conspiracy (HARPERS FEB. 1981) will be defeated so that we do not continue to use 4x our share of the planet's resources wasting 1/2 just commuting to work in major urban areas (that is why Senator Magnuson put Withdrawal and Substitution in DOT law-used by Oregon to get 18 miles of rail for 1/10 of what WA taxpayers will pay because our elected officials refused to allow a vote on it.

Barbara Zepeda
308E Republican #708
Seattle WA 98102
206-324-8571

I-173-001

The public meeting handouts were intended as an overview of the project as were the displays. Sound Transit thanks you for taking the time to comment to the Draft EIS based on your receipt of the Summary Draft EIS.

I-173-002

The stations are planned to serve patrons using a variety of modes, with the majority of passengers expected to arrive by modes other than driving. However, the parking supplies considered reflect estimated demand and help park-and-ride spaces provide access to light rail for areas transitioning from suburban to urban densities. Sound Transit's System Access Policy is targeted to balance auto access needs, transit, and pedestrian and bicycles.

I-173-003

Your opinions are noted. Sound Transit remains committed to an open public process for project decisionmaking, and funding for the Lynnwood Link project was approved by voters in 2008.

of King County would decide to create themselves into the Port of Seattle.[30]

Prior to this election there was an important matter that had to be decided—who would run for positions of commissioners. The Seattle Harbor Commission and the Seattle Commercial Club, as well as other parties that were sympathetic to the public port movement, realized that the utmost care had to be exercised in the selection of those men who would run as the Port's first commissioners.* The special committee that Scott Calhoun was chairing for the Seattle Commercial Club, that had circulated petitions to put the Port of Seattle issue on the September ballot, acted as a screening committee for the selection of nominees to the Commission. As might be expected, those very groups that had worked so hard to defeat the public port legislation, i.e., the railroad and wharf interests, tried to place their own representatives on the ballot. Their strategy was apparent to almost everyone—they wanted to be certain that no port commission would carry out the mandate that the legislature had granted it, and put public interests ahead of private interest.[31]

Fortunately for the Port of Seattle, they failed, and generally the men that were nominated by the special committee of the Commercial Club and subsequently elected by the people of King County proved to be men of talent with a strong commitment to public service. The first man selected, and almost unanimously at that, was General Chittenden—the designer of the Lake Washington Canal. Chittenden, although paralyzed from the waist down proved to be almost tireless in his work for the Port in the brief years that were left to him. Chittenden was not only a brilliant engineer and an exceptionally learned man, but he also possessed a reputation throughout King County and most of the state for integrity and judgment—a reputation that was put to good advantage when the Port had to stand almost alone against occasionally hysterical critics throughout its first few years.

The second nominee that the Commercial Club put forward for one of the positions of Port Commissioner was by far the most controversial one, the former Populist Robert Bridges. Bridges had come to the U.S. from Ayershire, Scotland. It was in Scotland that he first experienced the inhuman working conditions that he was to campaign against the rest of his life. At the age of nine, according to Bridges' boast, he led his first strike when he headed a group of coal miners in a strike for better working conditions. When he arrived in King County in 1887, he went to work in the coal mines of south King County and became a union organizer. After working in the coal mines during the day, he taught himself how to read and write in the evenings and soon became an active force in various reform movements throughout the state.

Well-schooled in what the *Seattle Star* would call "The University of Hard Knocks," Bridges entered politics in 1896. In that year, after refusing a railroad pass and walking from Seattle to Ellensburg, he became the Fusion candidate for State Land Commissioner and was easily elected as the Populists swept the state. One of his first acts as Land Commissioner was to severely attack the Second Harbor Lines Commission for their giveaway of much of Seattle's valuable tidelands to the private dock and wharf owners.[32]

Looking more like a longshoreman than a port commissioner, Bridges stood six feet tall, with a great bony, broad face that seemed to wear a perpetual snarl, as it looked out from under a closely cropped head of hair that appeared to have been trimmed by an unsteady barber wielding a pair of hedge trimmers. The belligerent appearance of his looks was matched by an equally antagonistic personality and he never hesitated to attack what he termed simply "the interests" or the "kept press." He remained a controversial figure all his life. But even Bridges' enemies, who were numerous, gave him a certain grudging respect. Soon after Bridges was nominated by the screening committee, the *Town Crier*, the unofficial

*Section Two of the Port District Act provided that any qualified voter could run for one of the three positions available after he had secured the signatures of 100 qualified voters on a nominating petition.

organ of the Chamber of Commerce, anticipating Bridges' domination of the Port Commission, warned its readers that his election would undoubtedly destroy the "usefulness" of the Port Commission—a fateful prediction that was, to the *Town Crier's* horror, soon realized.[33]

The third nominee, C.E. Remsberg, was something of a mystery and a bit of a "wheeler-dealer." Nominally a Republican and chosen to balance the ticket between the supposedly neutral Chittenden and the Populist Bridges, Remsberg had come to Seattle shortly after the fire of 1889. Intending to only visit the city before returning to Virginia, he sensed that there were greater business opportunities in Seattle, and he decided to stay on. After investing two years' work in writing *The Revised Statutes and Codes of the State of Washington* and finding little demand for the book, he turned to real estate speculation in the northern part of the city. He had been a Justice of the Peace briefly from 1890-95, and was the manager of a small bank in the Fremont section of Seattle. He was, despite these ties, philosophically committed to the idea of municipal ownership and in some ways would prove himself as politically radical as Bridges.[34]

The actual decision by the voters of King County on September 5, 1911, to create a municipal corporation to be known as the Port of Seattle, was a fairly easy affair. The future Port had the support, in varying degrees of intensity, of every major newspaper in the city. The only groups that opposed it were the private dock and wharf owners. Even Colonel Blethen's *Seattle Times*, which tended to look on any mention of municipal ownership as something akin to a radical Wobblie plot, gave the proposal a limited degree of support. With such support the election proved to be a rather one-sided event and the Port of Seattle was created by a margin of more than three to one (13,771 to 4,538). The race for the three commissioner positions was equally one-sided, with Bridges, Chittenden and Remsberg easily defeating their opponents. But before the Port Commission could even begin to draw up a comprehensive plan the opponents of municipal ownership were actively engaged in trying to reduce the Port to little more than a welfare agency for the private dock owners. Behind the Port were the long years of bitter struggle, while ahead of it lay, not a respite, but almost ceaseless controversy to maintain the very fabric of a public port.[35]

vituperative spokesperson for the highway lobby, swallowing their orders without any attention to facts. The bill she signed merely changed the Department of Highways name to the Department of Transportation—the obsolete and useless department of transportation we still have. Her DOT law perpetuated the old, completely closed machinations in the Highway Department. It enlarged the highway commission from five to seven members, and the highway commission members were still figureheads, who merely nodded from time to time to acquiesce to the decisions that had already been made. The secretary was to be appointed by the governor from a list of three persons submitted by the commission, and the secretary was to have no term of office—unless forced out of the job by proof of wrongdoing.

The DOT perpetuated all of the old practices controlling spending. The department still would be funded with state highway trust funds that the State Constitution amendment limited to being used for ferry and road purposes only—so the transportation planning

ME FIRST-ME, ME, ME-- ME!!
CAN'T YOU SEE- I'M STARVING TO DEATH?

WASHINGTON COALITION FOR SENSIBLE TRANSPORTATION

processes could not be comprehensive and multimodal. The highway budget would continue to be used to coerce legislators to vote for bad bills at the threat of losing their highway projects; the highway budget bill would still be kept undercover until the end of the legislative session to prevent any worthwhile legislative review.

Now, in 1999, the highway lobby has a complete victory:

- The state of Washington still has no Department of Transportation—the electorate has no control over the spending of billions of dollars.
- The gas tax has been raised and raised.
- Referendum #49 was passed by 58% of the voters in the Washington State November 1998 election. It was a very clever move—all of the people who paid for state motor vehicle licenses were to get a $30 cut in their motor vehicle taxes. The campaigners were able to conceal the fact that Referendum #49 made the state lose $1.9 billion general funds (school funds, etc.) that were transferred to the state highway trust!

Seattle Saves Seattle?

Seattle will be saved only if the elected officials and the people of the city decide to save themselves—to pass this ordinance:

The city of Seattle hereby prohibits any additional capacity for motor vehicles in the city, except for a bus/rail transit ramp from I-90 at I-5 to the stadiums.

To quote Doug Kelbaugh: "Seattle must control the motor vehicles—the motor vehicles cannot control Seattle".

Can Seattle be saved? The saving of Seattle starts late, maybe too late. Seattle has suffered irreparable damage from the construction and use of the big freeways into and through the city: Interstate 5 was supposed to be build east of Lake Washington, but political decisions were made for it to go through downtown Seattle—and the I-5 corridor bisected the two narrow peninsulas of the city, forced thousands of people out of their homes, created a noisy, polluted environment for those residents left within six blocks of the right-of-way and ramps, and made east/west travel difficult anywhere in the city. The construction of and traffic on the SR 520 bridge and highway have devastated the lovely fragile waterfront from Laurelhurst and the University on the north and the Arboretum, Montlake, Portage Bay and Roanoke on the south. To Whom It May Concern at Sound Transit:

I-174-001

The Seattle Latvian Center and Church have been a part of my life, literally, as long as I can remember. I am very concerned about the impact that light rail will have on the Center.

Starting as a very young child I attended Latvian School every Saturday. I started early because my Mom volunteered as a teacher at the school. My two brothers and cousins also went to Latvian School. Now, my older brother's kids have already gone through Latvian School. And, my younger brother's kids are currently enrolled. Seattle Latvian School is still thriving!

The Church has served as the foundation of many of my life's most important events. I happened to be born just before the church was built so I was christened at an interim church (after the City of Seattle forced the Latvian Community out of their original location in Wallingford). Over the years I have attended many christenings and wedding and, unfortunately, funerals. My brothers and I were all confirmed at the Church. This past May, in front of all of our friends and family, my wife and I were married at the Latvian Church.

May 5, 2013

The Latvian fraternities use Latvian Center for meetings and events. The center provides plenty of space and a central location where members from throughout the Pacific Northwest can gather. As a member of a Latvian fraternity I am occasionally called upon to serve in an honor guard when another member passes away. That is one of the traditions we use to show respect.

I-174-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Since the publication of the Draft EIS, Sound Transit has revisited the alternatives in Segment A and modified them so that none of them would result in the displacement of the Seattle Latvian Center and Church. Please see the Final EIS for a description of the updated Segment A alternatives in Chapter 2 and revised text on the potential impacts to the Seattle Latvian Center and Church in Chapter 4.

I-174-001

Latvians honor their dead. You can see that if you stop by the Latvian Cemetery at Evergreen Washelli. Like many of my friends and family, we regularly stop by the cemetery to tend to the graves. It's in our DNA. It doesn't matter what time I stop by, weekday or weekend, more often than not I will see another Latvian at the cemetery there doing the same thing. Even if we're not leaving flowers, we're there to clean the headstones, pull weeds, or whatever needs to be done. I would think we have the best-kept part of the cemetery! I need to point out the close proximity of the Latvian Center to the Latvian Cemetery at Evergreen Washelli. All four of my grandparents are buried there.

We have less serious fun at the Latvian Center, too. Coming up on September 7 will be the annual golf tournament. After taking over the Jackson golf course for a day, we head back to the Center for steaks and tall stories about golf. People fly in from out of town for this event. The evening ends with the crowd gathering to sing songs. That may sound corny if you haven't been raised that way.

The Latvian Center is a crucial cultural hub for many families like mine in Washington State. I hope that Sound Transit can figure out a way to proceed with their expansion to Lynwood without destroying such an amazing place.

Thank you.

Subject: east-west traffic near stations

I-175-001

Hi -- If stations are built at either N. 155th St. or at N. 185th St. in Shoreline, the construction process and ultimate layout of the station areas must take into account the important function of these two east-west corridors. As is well known, east-west traffic flow is more difficult because of the lack of corridors vs. north-south traffic flow. Currently, for the cities of Shoreline and Lake Forest Park, the most expeditious traffic flow is on N. 155th St. and N. 185th St. This is because flow on N. 145th St. and SR 104 is hampered by traffic density and numerous traffic signals at their I-5 interchanges.

So, if stations are built at either N. 155th St. and/or N. 185th St., make sure that east-west traffic flow for pedestrians, bicyclists and vehicles is as little impeded as possible during both construction and subsequent light rail operation. Such mitigation measures as double-left turn lanes and sequentially timed traffic signals should be included.

Thanks for listening!

jeff altman
18474 40th Pl. NE
Lake Forest Park, WA 98155
206/364-2180

1

I-175-001

The EIS includes an evaluation of how station sites and their construction activites would affect east-west alternatives. The project's detailed construction management plans will maintain effective east-west access and accommodate bicycle and pedestrian traffic as well. See Chapter 3 for more detail on traffic impacts and Section 3.6 for potential mitigation. Appendix H also shows conceptual plans for the Preferred Alternative, which includes further detail on some of the street improvements featured in the Preferred Alternative to maintain effective traffic operations.

I-176-001

Of the B segment alternatives that I've looked at, my wife and I both prefer the B2A alternative. It would be optimal to have the rail station be in the parking lot of the transit center rather than the freeway median. Ridership would be higher, and it would also leave the current freeway bus station open during a lengthy construction period.

We like the idea of having 2 Mountlake Terrace stations in place. The parking at the current MLT Park and Ride can be a nightmare during the middle of the week, especially during fall and winter months while UW is in session. Sometimes the lot is full by 9am and doesn't have vacant spots until early afternoon. Having an additional station at 220th would relieve pressure on an already overstressed Mountlake Terrace Transit Center.

Our second preferred option is B1, which has a lower environmental impact than B2A and is more affordable.

Lastly, if alternative B4 is NOT chosen, I'd love to know what would happen to the current freeway station. After all that time and money putting that quality station in place, it would be a shame to scrap it entirely. Hopefully it could be put to some valuable use.

1

I-176-001

Thank you for your comment stating your preference for Alternative B2A with the second Mountlake Terrace light rail transit station at 220th Street SW and your second choice support for Alternative B1. The continued use of the Mountlake Terrace freeway station is not a Sound Transit decision. The agency will coordinate with the bus transit agencies to realign bus services to serve the new light rail transit station. Sound Transit is also participating with others in planning for potential options for the existing freeway station, although this depends on the decisions about the light rail project to be built.

Subject: Latvian Center Sound Transit EIS

Comments;

I-177-001 1. The Latvian Lutheran Church and Latvian Center are linked as a cultural resource for Latvians and other Baltic Countries sharing a cultural heritage marked historically by repression and oppression felt by the older members who fled in 1944 and then spent years in displaced person camps in Germany prior to immigration to the USA and other countries. This center and church is their only meeting place and has been for nearly 40 years. The Church and Center are inseparable and the Sound Transit link proposed will destroy this resource regardless of which alternative is chosen. Insufficient discussion of this issue in the EIS.

I-177-002 2. This project should be a design-bid-build project which will allow more time and more public input as time goes on.

I-177-003 3. This project impact should require a Full EIS to adequately address alternatives that will not impact the Latvian Church and Center.

I-177-004 4. An engineering assessment should be included in EIS to assure that the project will not affect the Church or Center with excessive noise and vibration from the proposed route and and trains.

I-177-005 5. It may not be possible to provide adequate financial or other mitigation due to the necessary encroachment on the property by this project. To relocate the Center from the Church is the equivalent of separating a child and its parents.

I-177-006 6. Reconsideration of an alternate route or project bypassing entirely the Latvian Church and Center is the only proper way to save this cultural heritage gathering place from destruction.

Thank you,

David C. Johnson, J.D.
8168 Cultus Bay Rd.
Clinton, WA 98236

I-177-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church.

I-177-002

Sound Transit acknowledges your comment stating your preference for design-bid-build procurement method for construction of the Lynnwood Link Extension project. A final decision on this issue may be expected soon after Sound Transit makes a final decision on the selected alternative following the publication of the Final EIS. Irrespective of the method of procurement, Sound Transit will continue to conduct community outreach activities.

I-177-003

Since the publication of the Lynnwood Link Extension Draft EIS in June 2013, additional engineering was undertaken to reduce adverse effects on the Latvian Evangelical Lutheran Church property and facilities. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall (also called the cultural center). Access to the property and its functions will be maintained, but involve a street realignment.

I-177-004

A detailed Noise and Vibration Technical Report was prepared in support of the EIS to assess potential noise and vibration impacts on the Church and other projects. Since publication of the Draft EIS in June 2013, additional engineering has been undertaken to refine the Segment A alternatives and avoid or further minimize adverse effects on the Church. With the engineering design refinements to the Segment A alternatives, additional updated noise and vibration analysis was conducted to re-assess potential noise and vibration impacts on the Church. See Section 4.7 in the Final EIS and the technical report

included with the Final EIS. If noise and/or vibration impacts are predicted, Sound Transit has identified mitigation.

I-177-005

The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE which avoids the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describing the acquisition impacts; Section 4.4 describing impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

I-177-006

Thank you for your comment stating your preference that an alternate Segment A route for the proposed Lynnwood Link Extension project that would entirely bypass the Latvian Evangelical Lutheran Church. As noted above, a design modification to maintain access avoids the potential for displacing the church.

Subject: Rail routes C1-C3

I-178-001 After reviewing the DEIS, I'm convinced that route C3 is the best. It connects directly to the Park-and-Ride & adjoins the Transit Center. **Most important:** It does not destroy valuable and irreplaceable park space and green space. Light rail should serve the cities it connects, and not destroy their livability.
Dr. Garry Kampen

1

I-178-001

Thank you for your comment stating your preference of Alternative C3 because of reduced impacts to parklands.

Subject: Comment c/o Lauren Swift

I-179-001

I strongly favor alternative C-3 which is the only alternative that doesn't unbelievably take a wetland set-aside bought with conservation futures based on its resource value to the region of a perpetual nature.

One would think such a flaunting of condemnation procedures would be challenged up to the Supreme Court for affecting an in-perpetuity easement for the public good.

Public set-asides particularly close to urban centers are of high value to the population in addition to their importance for the good of the planet.

If option C-3 is the one passing close to hotels, a station stop should be designed to accomodate hotel customers to use transit to arrive and conduct business or travel to recreational opportunities.

I would like to be added to the mailing list for information pertaining to this decision.

George Lockeman, 2430 81st Pl SE, Everett, WA 98203 Sent from my Verizon Wireless BlackBerry

1

I-179-001

Thank you for your comment stating your strong preference for Alternative C3 due to reduced impacts to the nearby wetlands and avoidance of direct impacts to Scriber Creek Park. Thank you for your suggestion that easy access to the light rail transit station should be provided to nearby hotels. The Preferred Alternative includes pathways as well as street and sidewalk improvements to improve connectivity in the area.

To: Lynnwood Link DEIS
Subject: Lynnwood Light Rail DEIS

I-180-001 I support a light rail station at NE 130th Street. It will be useful for trips from Lynnwood to Lake City and also to parts of SR99, assuming reasonably good bus connections. I actually would occasionally use a light rail stop at 130th to get to Krispy Kreme on SR99 before work, and to Lake City Gyros after work; these are just two examples of the many new connections that would open up.

Options A7 and A11 seem too expensive, so I would support A5 or A10.

I-180-002 Extending light rail to an Alderwood Mall station as soon as possible is very important, although I realize this is beyond the scope of Options C1/C2/C3.

Mike Manderscheid
Lynnwood

1

I-180-001

Thank you for your comment stating your support for a light rail transit station at NE 130th Street and Alternatives A5 and A10. Regarding bus service at the new light rail transit stations, changes to bus services will be considered by Sound Transit, King County Metro, and Community Transit as the project approaches operation. Initial plans used in the EIS analysis anticipate improved east-west connections to the station areas with connections to other north-south corridors.

I-180-002

Thank you for your support of Sound Transit's light rail extension program and your particular interest in a future light rail station at the Alderwood Mall to the north along the I-5 corridor.

Subject: Lynnwood Link Extension DEIS Comments

September 6, 2013

To whom it may concern:

I am a resident of the Ridgecrest neighborhood in Shoreline, Washington and live near the intersection of NE 148th and 6th Ave NE. As such, I will focus my comments on the light rail impacts to that immediate area.

I look forward to having Sound Transit Link Light Rail service extended to the area and hope the future station will be thoughtfully designed to complement the existing character of the quiet residential neighborhoods nearby.

Below are a few of my observations on information provided in the Draft Environmental Impact Statement:

1. Preferred Alternative Segment A:

I-183-001 a). A1: At-grade/elevated to NE 145th and NE 185th east side stations.

b). Referencing the DEIS Appendices Figure G-34 and G-35 Viewpoint 10: Less elevated tracks along Jackson Park golf course indicated in Figure G-34 are more consistent with scale of surroundings, especially when compared to figure G-35. Same is true when comparing DEIS Appendix Figures G-31 and G-32 Viewpoint 9.

I-183-002 c). Minimize disruption to current tree canopy/ forested character/ Thornton Creek wetland zone at east side of I-5 as experienced when driving north past 130th towards Shoreline. Currently appears as a transition from the less forested areas south of 130th to much more densely forested zone- this character should be maintained as much as possible.

I-183-003 d). Current Northbound 145th street off-ramp/ 5th Ave NE interchange creates a dangerous weaving traffic pattern. Elevated light rail and parking garage at 145th will only increase the congestion at this interchange. Any solution will require major improvement to the traffic flow through the intersection. 5th Ave NE is also the only reasonable access from the Ridgecrest neighborhood to Northgate, so maintaining this local access route is critical.

I-183-004 e). Major improvements needed to pedestrian and bicycle infrastructure in the area to improve safety of station users traveling to and from the station, especially along 145th and along 5th Ave NE (South of 145th).

2. NE 145th Station Layout comments:

I-183-005 a). Station Layout Option 1 (Preferred)

-Seems to maintain existing traffic flow at 145th while filtering new congestion created by Park and Ride Garage users.

-Maintain existing 20' +/- swath of mature trees along 5th Avenue NE at current Park and Ride entrance!! Consider a more compact parking structure with additional level (similar to Option 2) to accommodate this. Would preserve tree canopy character entering into Ridgecrest neighborhood and provide a

1

I-183-001
Thank you for your comment noting that the lower elevation alternatives are more visually consistent with the surrounding area.

I-183-002
This project will abide by all applicable federal, state, and local environmental laws and regulations. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts to environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure there is no net loss of ecosystem function and acreage as a result of agency projects.

Sound Transit will also abide by the tree replacement policies of WSDOT and local ordinances.

I-183-003
Mitigation measures for increased traffic congestion as a result of the station at 145th will be included as part of the project. 5th Avenue NE access will be maintained similar to today. Please see potential mitigation included in Chapter 3 and Mitigation Plan.

I-183-004
The Preferred Alternative's NE 145th Street Station includes improved sidewalks and bike lanes along 5th Avenue NE and portions of NE 145th Street; please see Section 2.4 for other standard elements of the stations.

I-183-005
Your comments stating your preferences for the two layout options for the NE 145th Street Station are noted. The Preferred Alternative has updated the design based on Option 2.

I-183-005

natural visual/acoustic buffer to the parking garage. There is an especially nice grove of mature trees in and around the current park and ride at the east and north edges.

-Plaza landscaping at corner of NE145th should reflect character of entering a residential neighborhood. Natural vegetation, rain gardens, pedestrian scale all important. Appreciate possibility of detention pond indicated in Option 2 working as a rain garden/place marker/white noise buffer to the freeway noise. Work with City of Shoreline on goals for this plaza.

-Existing northbound on-ramp location creates hazard for pedestrians heading to/from the Park and Ride from cars turning onto the ramp. This hazard will only increase with increased pedestrian and vehicle activity in the area. Crosswalk should be well marked and signed. Consider eliminating Bus flyer off ramp to reduce width that pedestrians must cross and to reduce undue traffic complexity.

-Scale of retaining walls at plaza seems excessive- consider gradually transitioning landscape to mimic flowing landscape that currently exists.

-Provide acoustical separation at platform level so that noise from freeway is not overwhelming while waiting for train. Current freeway bus flyer stops are extremely unpleasant to stand at- would hope to avoid the same downfall with the light rail stations.

b). Station Layout Option 2-

-Seems to create a more compact/clearly defined Station Area with the northbound onramp at the north edge of the station zone. Concern is that it may only exacerbate the current congestion at the intersection. Park and Ride exit location would appear to cause additional congestion at peak hours.

-I like how this layout has more presence along NE 145th as a beacon- it may help reduce perceived distance for residential commuters living across 145th west of I-5.

-Like how it pulls the station to the edge of the Ridgecrest neighborhood for fewer potential noise/visual conflicts. Maintains residential buffer at NE 148th street- trees should be preserved in this zone if possible.

c) General Comments about 145th station-

I-183-006

- Hope that Sound Transit station design team would work closely with the adjacent neighborhoods (especially Ridgecrest and Parkwood) during the design phase to create a welcoming, appropriately scaled, thoughtfully designed station and parking garage that fits with the neighborhood character.

Thank you for your time in considering my comments.
I am looking forward to a consistently reliable form of public transit for the region!

Sincerely,

Kyle Phillips

206-282-2488
kyleiphillips@gmail.com

2

I-183-006

The Sound Transit Design Team is committed to working with local jurisdictions and neighborhoods in designing functional and attractive facilities that are as consistent as possible with neighborhood scale and character. The Section 4.5.6 of the Final EIS includes additional discussion of potential mitigation measures for station and parking garage visual impacts.

Subject: Lynnwood Link Extension in Shoreline

Hello,
I was unable to attend the recent meeting you had at the Shoreline Center due to working. My husband attended and brought home materials which I've read through.

I-184-001

I have one question/comment. We live on 188th St. between 10th Avenue and 15th Avenue NE. I see this street as one of the routes people will use to get to the parking area/garage for the light rail. Our street has no side walks. It has a hill and a curve on it. It is posted currently with a 25 mph speed limit which is way too fast to be going around a blind curve in a residential area. We already have difficulty getting out of our garage and drive during the "rush hour"
times. We have children who use the street, and elderly people crossing to get their mail. Some people drive irresponsibly through this hill and curve area.
If we are to have increased traffic, then we need speed bumps - not humps but actual bumps. Posting signs won't do anything to change behavior.
My husband told me that the person he talked to at the meeting said that Perkins Way will be the main route to the light rail. How will this be enforced? Our street would be the quicker cut through from Lake Forest park areas and areas north of 15th.
As a driver I know that I don't always follow "arterial" signs, or signs saying "To _____" if I know a quicker way to get there or a way that has less traffic on it. I would suspect I'm not the only one to do this.
I would appreciate more details in future meetings about who is determining this traffic pattern, EXACTLY how it will be marked and enforced. And I want to talk about major deterents to using other routes.
Thank you for your work on this. I hope to be at the next meeting - work permitting.
Karen Summers

1

I-184-001

Sound Transit has identified potential cut-through traffic as a potential impact for station area neighborhoods, and identifies mitigation in Section 3.65, which describes measures that could be developed in coordination with the local jurisdiction.

Subject: Scriber creek park

I-185-001

My husband, Ryan, and I believe that the citizens of Lynnwood would be better served if the third alternative (C-3) were to be chosen which affects six to twenty properties, eliminates one business and runs along I5 at the cost of $340 million.

Fewer people would be displaced and the park which was funded by a group (Conservation Futures) who designated it for conservation would be retained for thousands of people. People from outside the city of Lynnwood use the park as well. We have enjoyed the park a few times a year for over twenty years and would really miss it.

We think those two reasons alone make the C-3 decision the only correct one.

Thanks,
Ryan & Sharla Unruh
14525 81st Ave NE
Kenmore, Wa 98028

1

I-185-001

Thank you for your comment stating your preference for Alternative C3 due to fewer displacements and impacts to Scriber Creek Park. Alternative modified C3 is the Preferred Alternative, which avoids the park property.

To: Lynnwood Link DEIS
Subject: Comment

I-186-001

Please consider the C-3 plan for the new light rail to Lynnwood. This is the most honorable choice since you will not be destroying a conservation park.

Sound Transit has made some very foolish choices with their planning in recent years. If you want the voters to continue to fund ST then it is highly suggested you pay attention to the voting public. They could underfund ST by voting against any new money's that are requested.

Please take the high road and leave the conservation park option alone.

Thank you,

Shelley Weyer
Everett, WA

1

I-186-001

Your preference for Alternative C3 due to its avoidance of Scriber Creek Park is noted. Modified C3 is the Preferred Alternative, which avoids Scriber Creek Park.

Subject: Lynnwood Link

My name is Linda Willemarck. I live at 4900 200th St SW in Lynnwood. Since learning about the Sound Transit's Alternatives for the Lynnwood Link, a mere 3 months ago, I have spent a great deal of time trying to understand what properties are involved and what impacts it will have.

I-187-001

As you know, both the C1 and C2 Alternatives would be going down 52nd Ave West/Cedar Valley Road. In my research I found a very compelling document that really puts into perspective the importance of this area. The document reads, quote "...an established single family neighborhood containing hundreds of affordable homes and is in close proximity to several affordable housing apartments and condominium complexes, all of which would be adversely impacted by light, noise, property values, and other impacts ..."
"directly impacts hundreds of affordable homes when there are other sites available, raises social justice issues..."
"...located adjacent to significant city recreational resources of Scriber Creek and associated wetlands, and the city's Scriber Creek Park, that provide places to experience nature in close proximity to Lynnwood's City Center and regional Interurban Trail, both of which would be negatively impacted..."

I-187-001

Thank you for your comment expressing concerns about the adverse effects of Alternatives C1 and C2, including citations from the City of Lynnwood Resolution #2012-07 requesting elimination of routes along 52nd Avenue W and Cedar Valley Road from further consideration.

While the alternatives are evaluated in the Final EIS, they are not the Preferred Alternative. Section 4.4 of the Final EIS includes a detailed analysis of potential impacts to the 52nd Avenue West area, and it also summarizes the Environmental Justice analysis contained in Appendix C. The analysis does not identify impacts at the levels the City's resolution describes.

In November 2013, the Sound Transit Board identified a Preferred Alternative based on Alternative C3 with some modifications to its alignment as it enters the Lynnwood Transit Center. Please see the Final EIS for the description of the Preferred Alternative, which was developed in collaboration with the City of Lynnwood, and which avoids direct impacts to Scriber Creek Park and avoids running along 52nd Avenue W.

I-187-001

"...Therefore, the City Council of the City of Lynnwood does hereby resolve and request the Sound Transit Board to remove from its potential sites and evaluations list the Lynnwood 52nd Avenue West/Cedar Valley Road site..."
....that such site not be included in any environmental analysis, due to its many significant and unresolvable and irreparable impacts upon the City of Lynnwood, its residents and businesses and upon the Edmonds School District."
These quotes were taken from Resolution No. 2012-07 of the City of Lynnwood, Washington, regarding issues concerning the potential siting by Sound Transit. It was signed by Mayor Gough of Lynnwood on 10/22/2012.

I-188-001

Thank you for your comment stating your preference for Alternative C3.

MR. CAMERON: Hello. My name is Michael Cameron, M-I-C-H-A-E-L, C-A-M-E-R-O-N. I live at 20035-12th Avenue Northeast, Shoreline.

That property butts right up against the Exit 177 offramp going north.

Conceptually, I'm a big supporter of the project. I think it's a good thing for the region. I think it's probably what the region needs, overall. But that enthusiasm's tempered a little bit by reaction to some of the current designs of the plan. And I'm hoping that some of those can be addressed in the final EIS. Those are going to be recommendations today.

Specifically, the design issues that I have are how they directly impact me, as a private property owner, and our house, specifically, with regards to noise and the visual impacts.

I-189-001

I'm encouraged by the numbers that I read in the draft EIS with regards to noise and the impacts that the mitigation plans in place will have. Sounds like -- no pun intended -- that the mitigation plans will be able to deal with much of the sound in the area.

I'm a little bit skeptical of them, however, because the microphone locations that they used were quite a distance from my house and the neighborhood, so it's -- theres's a lot of topography changes, hills, valleys, trees

I-189-001

Thank you for your comment. We have added noise monitoring sites in your area, including one near your home at 20039 12th Ave or 20041 12th Ave for use in the Final EIS analysis. The analysis considers topography, vegetation, and noise barriers; more specific details are given in the Noise and Vibration Technical Report for the Final EIS, which identifies mitigation by address. During final design, mitigation definitions will be further evaluated to ensure they achieve the noise reduction required to be below the impact threshold.

I-189-001

and things, some of the trees that will be removed, that I think need to be taken into account with those. So my hope is that the study would be repeated, a least with a couple additional microphones, sort of in my neighborhood, to make sure that the estimate of sound impact on the final EIS is appropriate for the location.

I-189-002

All of -- the next issue is that the current draft EIS identifies the visual impact of -- on my house, on my property, as low. I take issue with that. All the designs for the light rail have the track less than a hundred feet from my property. They are elevated 25 feet above the I-5 offramp. Adding another 12 feet for the train, 5 to 10 feet of superstructure indicates a structure three to four stories high a hundred feet from my house. That's not a low impact.

So I'd like to see a reevaluation of the visual impact on my property. I'd like to get a good idea of how many trees will remain as this will mitigate some of my visual concerns. Currently, when I look out the window, I just see filtered light through a bunch, you know, of evergreens that definitely won't be there.

I'd like to see an artist's rendering on how the track is expected to look from the neighborhoods, specifically my neighborhood, as opposed to I-5, which doesn't really impact people when they're driving by it at

I-189-002

The Final EIS includes an updated assessment of impacts of the elevated structure in your area, but the Draft EIS was not intended to define visual impacts parcel by parcel, but rather for larger areas or viewsheds. It is accurate that some locations, particularly those immediately near the facility, could have higher localized impacts. Mitigation measures could include replacement plantings, but clearing and visual impacts are likely unavoidable in some locations. Sound Transit's tree clearing policies for elevated light rail provide for clearing within 30 feet of the centerline of the structure, or about 15 feet from the edge of the structure. The Final EIS, Section 4.5.6, identifies visual impact mitigation measures for the project, but the detailed definition of plantings in specific locations would be accomplished during final design. Replacement trees would be considered where space was available, but likely would take time to mature to replace the screening.

I-189-002 60 miles an hour. Knowing the visual impact with an artist rendering from property is much more useful.

I-189-003 And finally, I'd like to see a consideration of keeping the train at ground level at that location. I think that would go a long way. And perhaps placing the track between the offramp where it splits from the main I-5, that is, moving it west about 20 feet, such that the track would cross the offramp 500 feet further south than is currently planned.

That's it. Thank you.

MR. ROBERTS: Thank you.

I don't have anyone else signed up to speak. But if there is someone who would like to address us, this would be a perfectly appropriate time. So is there anyone else who would like to speak tonight to us?

///

///

///

///

///

///

///

I-189-003

Sound Transit has reviewed your suggestions to consider whether they have the potential to avoid potential impacts near your property.
As the light rail profile approaches the property from the south, it is coming out of a cut into the hillside adjacent to I-5. To lower the profile through this area would require cutting even further into the hillside. At about 800 feet south of the property, the existing ground drops about 40 feet. Traveling north, the ground continues to drop further as it becomes adjacent to wetlands and State Route 104. Heading north from there, the next major connection point is the elevated Montlake Terrace Transit Station at 236th St. SW. To maintain a light rail profile meeting established design criteria based on safety and efficiency and to minimize the most negative impacts through this area, an elevated structure maintaining a minimum height over the southern-most State Road 104 exit ramp is needed. The elevation has been refined for the Final EIS, and the visual impact information in this area was updated. Also, there are a number of design constraints that require maintaining the light rail alignment in the approximate location as shown in the Draft EIS and now in the Final EIS. Based on design guidelines for the use of the I-5 right-of-way between Sound Transit and WSDOT, the light rail project footprint is outside of an approximately 94 foot section reserved for the freeway and potential future improvements. The horizontal alignment is also constrained by a more narrow width of existing right-of-way between NE 185th St. to north of NE 195th St. To provide a horizontal design as shown in your Figure 2a-b, while still meeting the project's light rail design standards, would require further encroachment beyond the right-of-way and upon more properties and homes in this area. Therefore, Sound Transit is continuing to propose the Preferred Alternative design rather than your suggested alternative.

MR. CIRCENIS: My name is Edvins Circenis. That's spelled, first name, E-D-V-I-N-S; last name, C-I-R-C-E-N-I-S. I live at 6834-40th Avenue Northeast in Seattle, ZIP code 98115.

I-190-001 I'm also a member of the Seattle Latvian Lutheran church. The church was built primarily by a volunteer workforce. And I provided, without compensation, the conceptual and detailed design drawings for the construction of this church. The Latvian Lutheran church has been notified, prior to the DEIS publication, that our property at 11710 Third Avenue Northeast has been identified as one that Sound Transit may need to partially or fully acquire in order to construct the project under one or more alternatives.

Recognizing the seriousness of how this project may impact the Latvian Lutheran church and North Seattle communities, I am proposing, for your consideration, an option that, when properly executed, will save a number of properties from acquisition in the vicinity of Northeast 117th Street.

Looking at the satellite map, you will notice that the Latvian Lutheran church is right here and the freeway runs real close to our property. However, on the west side, there is a lot of room. So what I am proposing, to provide space for the needed Sound Transit, I'm proposing that

I-190-001

The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE, which avoids the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Please see Chapter 2, sections 2.6.1 and 2.6.2 for a description of the factors that led Sound Transit to place light rail east of I-5 rather than west of the freeway in this area.

I-190-001 the -- that the I-5 be relocated as needed, to the west, and the existing right-of-way as shown in my revised -- revised map in there. I revised it a little bit and moved the lanes to the west, and there still seems like maybe some room left on the west side as well. So depends on how much space we need. I don't think we need too much to do this.

I know that it's easier to condemn private property than it is to deal with federal government. But if you feel in your heart that it is worth saving Latvian Lutheran church, which is also a center for the Baltic communities in the Northwest, I sincerely hope that the Sound Transit board will give the alternative proposal its utmost consideration.

Thank you.

MR. ROBERTS: Next person is Inte Wiest.

///

///

///

///

///

///

///

///

///

///

MS. FAULDS: I would.

MR. ROBERTS: Please.

MS. FAULDS: Good evening. My name is Phoebe Faulds. My last name is F-A-U-L-D-S. And my family's house is at 1008-190th Northeast in Shoreline, Washington.

I-191-001 And I see that the project is affecting not just my house, but the community around it. I see that it affects the community center here. It's just over at the station but -- at the stadium, but it will affect a lot more than just the ball field. It will affect the communities that are having programs here, from dance lessens to swim lessons. And this is one of the only places that you can get a scholarship to get those service in Shoreline. Many, many low-income families use these services because they would not get these services any other way.

If you change this up, they won't get these services. You say that you're doing this for low-income housing around the area. But if you add low-income housing without services to low-income people, then you lose community and you make it less safe.

Once you lose community, it's really hard to get it back. So I hope that you'll reconsider the area, make sure that you keep these services in place, and reconsider anything that you might be taking away from the community.

Thank you.

I-191-001

Thank you for your comment on community impacts associated with the proposed NE 185th Street light rail station. Throughout project planning, Sound Transit has worked to minimize impacts on adjacent residential neighborhoods. Sound Transit recognizes the importance of maintaining the many community activities and services currently housed at the Shoreline School District property adjacent to the proposed transit station site. Property acquisition has been minimized to partial parcel acquisitions to preserve these community amenities. The impacts of Alternative A1 and the Preferred Alternative involves an edge of the stadium parking area and an auxiliary track. All of the existing programs and services would be able to continue operation at the stadium and the school district site. See Section 3.4.17 for more details.

MR. ROBERTS: Thank you.

Is there anyone else that would like to address us tonight?

Yes, please.

///

MR. JACOBY: Good evening. My name is Dan Jacoby, J-A-C-O-B-Y. I'm at 1243 North 160th Street.

I want to talk about, kind of, the future. And as you continue to plan, this is going to become more and more important. And that is, I straddle two generations, the baby boom, Gen X. I notice big differences between the two. And you look at the next generations, and you see even more big differences that impact, directly, what we're doing here.

The younger generations, it -- to me, the car was a status symbol. When I was in high school, getting a car was a big deal. Nowadays, kids don't really care so much. They'll ride mass transit. And the reason that that's more important is they got a lot of more of these gadgets, iPhones, smart phones, tablets, you name it.

To them, driving a car to work, to go home, to go out, they become disconnected. And they don't like that very much. If they ride the bus, if they ride the train, they can stay connected. And to them, even if it's a longer trip, it's still a better move.

I-192-001

When you're planning this, I think you can look at -- and especially, this will become important when Metro gets involved in terms of their bus lines -- making sure that there is plenty of connection via mass transit. I don't think you're going to need as many parking spaces as

I-192-001

While parking is an element of the access plans for the stations, Sound Transit anticipates that most patrons will arrive by connecting transit, walking, and biking. The alternatives under consideration provide additional parking for transit users compared to today. They were sized based on estimates of demand, which also account for an increased demand for travel using other modes to reach stations, including connecting transit. This also reflects Sound Transit Board direction, consistent with their adopted System Access Policy.

I-192-001 you might think because I think you're going to find a lot of people, especially the younger people, are not going to take the car to the train; they're going to take the bus to the train, if only there's a bus available.

This will help a lot. You know, he was talking about footprint. This could reduce footprint if you don't need as many parking spaces. But I think, also, it looks at not just the light rail, but what's next after that.

I-192-002 I'll tell you, if I wanted to make a gazillion dollars and I were an engineer, right now, I'd design buses and I'd design train cars where there's some way for a person getting into the bus or getting into the train to have a table top or something they can put their tablet on and continue to work. Because people are going to be showing up to work at ten o'clock, and they're going to be leaving at four. But they're going to be at work from nine to five because they're going to be on your train, and they're going to be on the buses.

So it's just something to think about as you go on and -- and, you know, start to solidify your plan, that you're going to see a greater demand for mass transit and a lower demand for cars as this goes on.

Thank you very much.

MR. ROBERTS: Thank you.

Next, Michael Cameron.

I-192-002

Thank you for your comment. Sound Transit will be working with local transit operators to develop refined transit service plans as the project nears operation.

MR. PETERSONS: Thanks, Paul. I've got to make this quick because I've got to go to birthing classes with my wife.

Hello. My name is Lukas Petersons. I am a member of the Seattle -- oh, should I start with my name and stuff? Sorry.

Lukas Petersons, L-U-K-A-S, P-E-T-E-R-S-O-N-S. I reside at 3009 North 130th Street, Unit 1201. And I represent the Latvian Lutheran church and center located at 117th and Third Avenue Northeast.

All right. So I'm a member of the Seattle Latvian community. And my parents are the caretakers of the Latvian church and community center, and they have been for the past 20-plus years.

I-193-001

Sound Transit's DEIS is proposing to run the North Link extension through our church's property, and a couple other alternatives are calling to eliminate our center altogether.

I wanted to speak on record to explain how much this church and community center means to myself and our greater Latvian community.

First, our church and community center serves as a living family tree. Our Seattle Latvian community's family tree is not only something replicated on a piece of paper. It is a living, breathing part of this community.

I-193-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. The Preferred Alternative in the Final EIS and all other alternatives now avoid displacing the church or church hall. The Final EIS describes the primary modifications for these alternatives in Chapter 2, Alternatives Considered.

I-193-001 The center provides a gathering place for Latvian children, teens, adults, and seniors alike. It is a place that is so important to our community and Latvian families. It is a family tree that cannot and, please, will not be uprooted.

Second, the DEIS understates the significance and importance of our church and community center. The service serves -- the center serves our Latvian community as a church, a gathering place, a school, and a facility to many Latvian community groups that exist in our state and also along the West Coast. In addition, it also serves as a gathering place for other Seattle Baltic communities, including the Lithuanians and the Estonians.

Now I'd like to speak on a couple items that are important to me in the church. I moved here when I was 8 years old, from Alaska, and my parents were asked to caretake the church. And one of the alternatives in the DEIS is basically going to tear down my childhood home along with the entrance to our church, so we would have no way to get in or out of our church.

Second, I also attended the Latvian school. I graduated there. And I really feel that preserving our cultural being is very important to us and the future generations. As I said, my wife's pregnant, and I would really love for my baby girl to be able to go to Latvian school and be able to folk dance and sing. And without the

I-193-001 center there, that won't be possible.

I graduated from the Latvian school. I taught the 4- and 5-year-olds there for four years. I folk danced in the Latvian troupe for over seven years and all our practices are held there at the center.

I have participated in many things there, volunteering at our annual Latvian rummage sale -- which is a huge success, and a lot of Seattle residents like that -- and along with our annual Christmas bazaar.

So in conclusion, I'd like to say that the Seattle Latvian Lutheran church and community center is and has been an important part of my life. It is a place that was designed, built, maintained, and loved by Latvians. It has helped shape my life and serves as a symbol of strength to all of us. Our community strongly stands together to protect the heart of our community.

Thank you, and I appreciate your time.

MR. ROBERTS: Thank you. Thank you. Lucas, if you have to get up and leave, we won't take it personally.

MR. PETERSONS: Thank you.

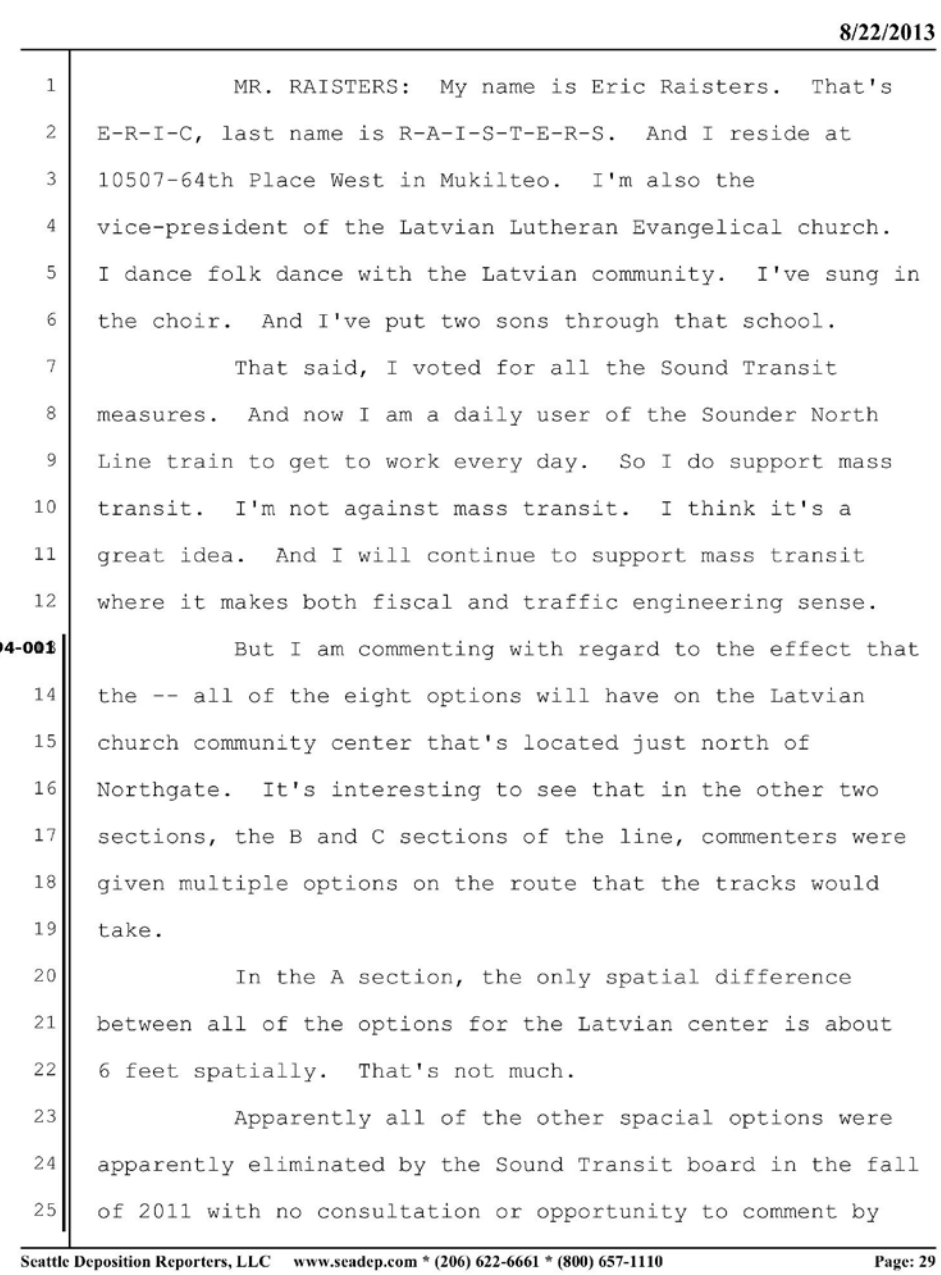
MR. ROBERTS: Next, we have Gunars Sreibers.

///

///

///

///



8/22/2013

MR. RAISTERS: My name is Eric Raisters. That's E-R-I-C, last name is R-A-I-S-T-E-R-S. And I reside at 10507-64th Place West in Mukilteo. I'm also the vice-president of the Latvian Lutheran Evangelical church. I dance folk dance with the Latvian community. I've sung in the choir. And I've put two sons through that school.

That said, I voted for all the Sound Transit measures. And now I am a daily user of the Sounder North Line train to get to work every day. So I do support mass transit. I'm not against mass transit. I think it's a great idea. And I will continue to support mass transit where it makes both fiscal and traffic engineering sense.

I-194-001

But I am commenting with regard to the effect that the -- all of the eight options will have on the Latvian church community center that's located just north of Northgate. It's interesting to see that in the other two sections, the B and C sections of the line, commenters were given multiple options on the route that the tracks would take.

In the A section, the only spatial difference between all of the options for the Latvian center is about 6 feet spatially. That's not much.

Apparently all of the other spacial options were apparently eliminated by the Sound Transit board in the fall of 2011 with no consultation or opportunity to comment by

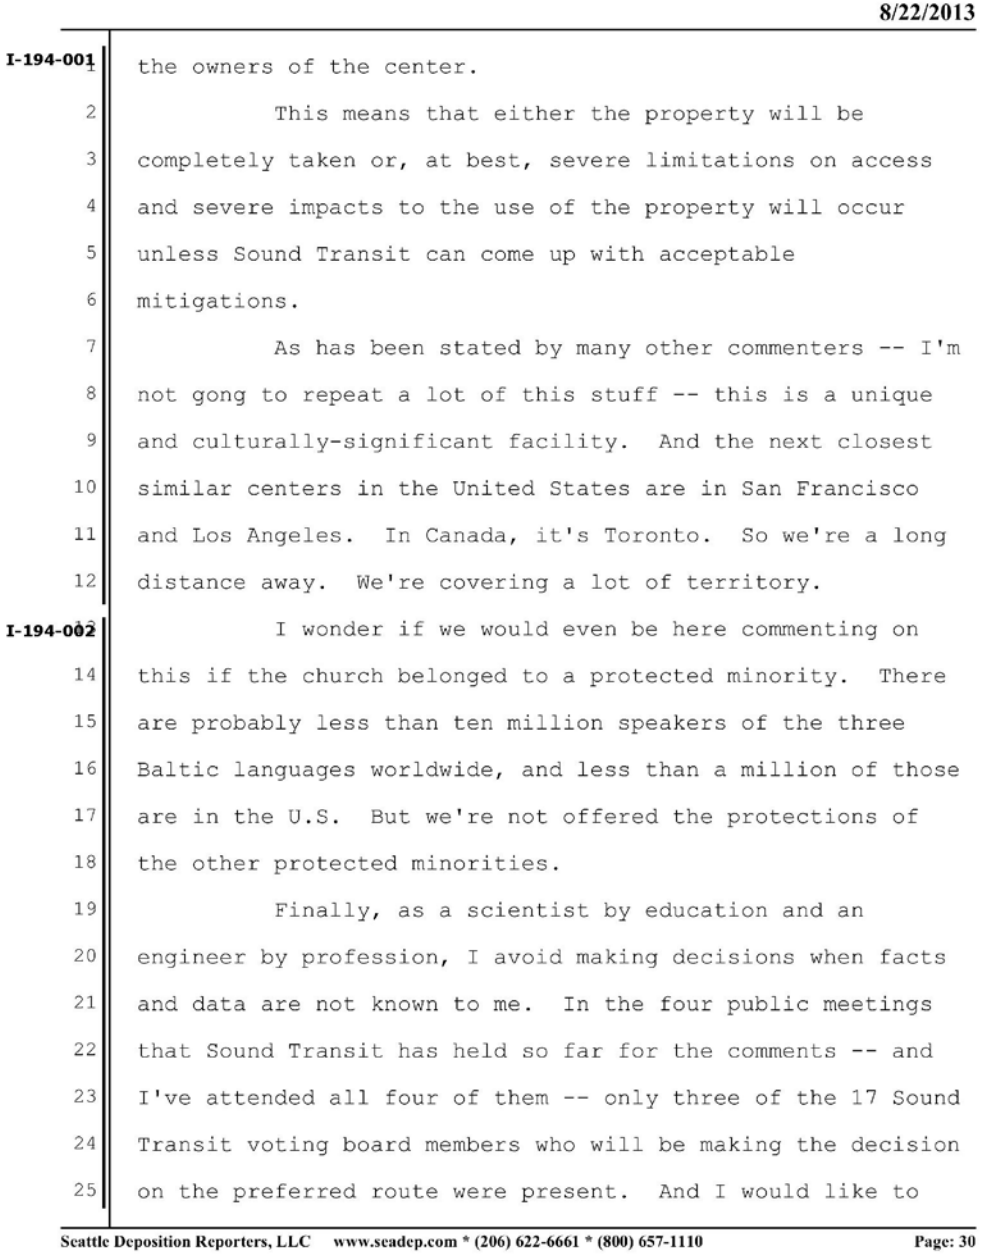
Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 29

I-194-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.



8/22/2013

I-194-001

the owners of the center.

This means that either the property will be completely taken or, at best, severe limitations on access and severe impacts to the use of the property will occur unless Sound Transit can come up with acceptable mitigations.

As has been stated by many other commenters -- I'm not gong to repeat a lot of this stuff -- this is a unique and culturally-significant facility. And the next closest similar centers in the United States are in San Francisco and Los Angeles. In Canada, it's Toronto. So we're a long distance away. We're covering a lot of territory.

I-194-002

I wonder if we would even be here commenting on this if the church belonged to a protected minority. There are probably less than ten million speakers of the three Baltic languages worldwide, and less than a million of those are in the U.S. But we're not offered the protections of the other protected minorities.

Finally, as a scientist by education and an engineer by profession, I avoid making decisions when facts and data are not known to me. In the four public meetings that Sound Transit has held so far for the comments -- and I've attended all four of them -- only three of the 17 Sound Transit voting board members who will be making the decision on the preferred route were present. And I would like to

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 30

I-194-002

The Sound Transit public outreach activities leading up to the publication of the Draft EIS did alert members of the Latvian and Baltic populations of the proposed alternatives for the Lynnwood Link Extension project and community members did become involved. Chapter 6 describes the public outreach for the project.

Although many of the Sound Transit Board did not attend the public meetings, the Sound Transit staff who did attend regularly, and who are the ones who interact most closely with concerned citizens, update the Board on the pertinent issues that should be considered on a regular basis. The Board was given the Draft EIS comments before they identified the Preferred Alternative and gave direction to modify all the Segment A alternatives so that none would require the displacement of the facility. Please find the updated description of the Segment A alternatives in the Final EIS Chapter 2, Alternatives Considered.

I-194-002 thank Councilman Roberts, Mayor Earling, and Snohomish County Executive Lovick for attending those sessions. Nobody from King County was there, nobody from the City of Seattle who represents our center.

This is less than a quarter of the board who have gathered the facts and the data required to make an intelligent decision. I hope, but have serious reservations, that the remaining members of the board will spend the necessary time to familiarize themselves with the probably hundreds of pages of comments and testimony so that they can also make an informed and intelligent decision. Sadly, the track record for this point for Sound Transit probably doesn't indicate that.

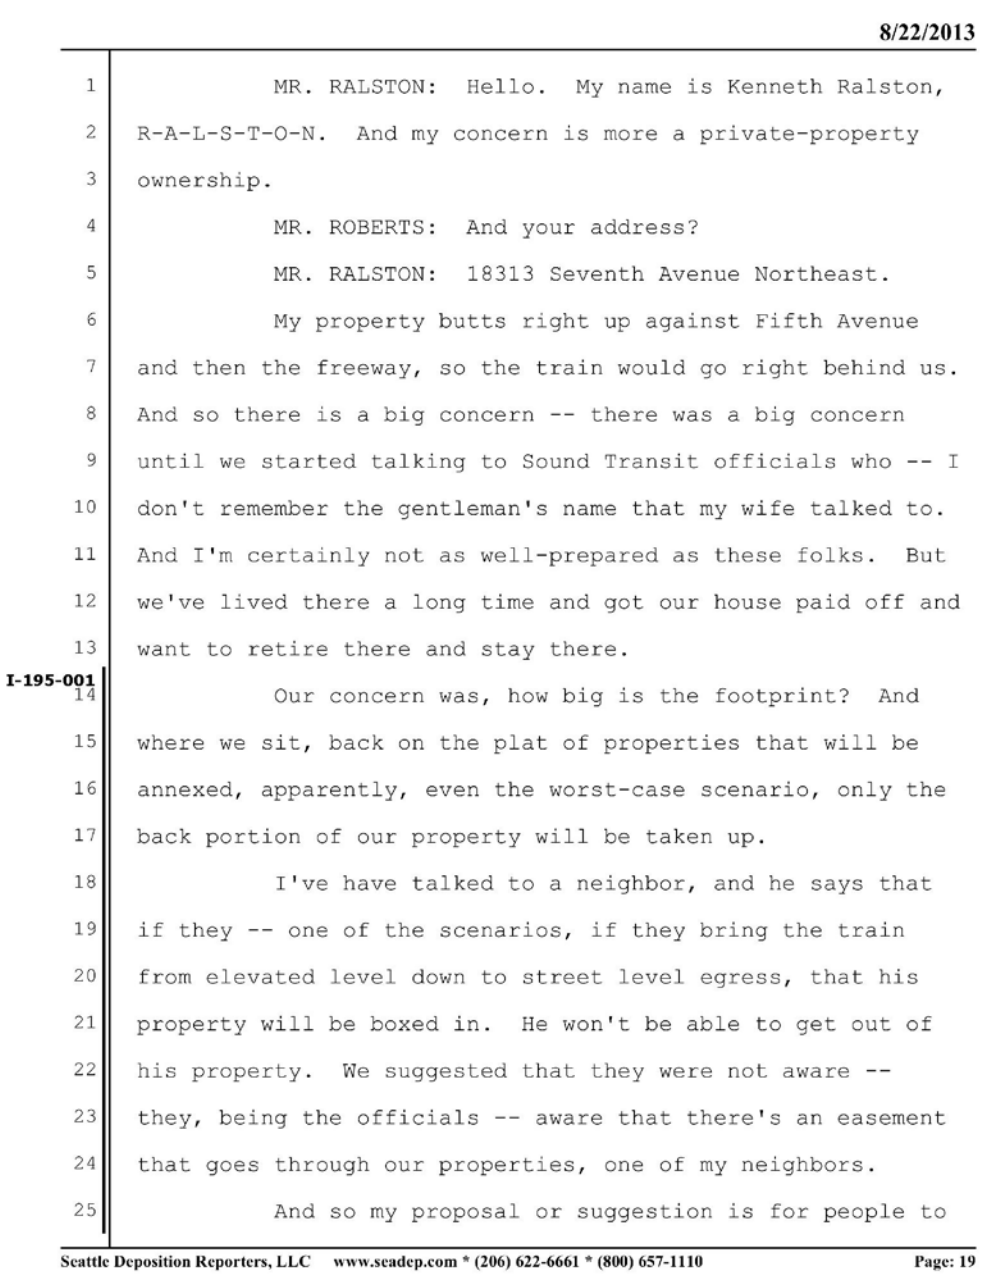
Finally, if the taking of the Latvian church should come to pass, the Sound Transit board will have the dubious distinction of matching what the Soviet Union did to the Baltic people, taking our land away twice, this time by the government of the land of the free and the home of brave.

Thank you.

MR. ROBERTS: Thank you.

Is there anyone who else wishes to address us tonight for the hearing? Anyone else?

Well, then I want to thank all of you for your comments. I want to let you know -- find my little notes



8/22/2013

MR. RALSTON: Hello. My name is Kenneth Ralston, R-A-L-S-T-O-N. And my concern is more a private-property ownership.

MR. ROBERTS: And your address?

MR. RALSTON: 18313 Seventh Avenue Northeast.

My property butts right up against Fifth Avenue and then the freeway, so the train would go right behind us. And so there is a big concern -- there was a big concern until we started talking to Sound Transit officials who -- I don't remember the gentleman's name that my wife talked to. And I'm certainly not as well-prepared as these folks. But we've lived there a long time and got our house paid off and want to retire there and stay there.

I-195-001

Our concern was, how big is the footprint? And where we sit, back on the plat of properties that will be annexed, apparently, even the worst-case scenario, only the back portion of our property will be taken up.

I've have talked to a neighbor, and he says that if they -- one of the scenarios, if they bring the train from elevated level down to street level egress, that his property will be boxed in. He won't be able to get out of his property. We suggested that they were not aware -- they, being the officials -- aware that there's an easement that goes through our properties, one of my neighbors.

And so my proposal or suggestion is for people to

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 19

I-195-001

At this stage in project planning, the property impacts are estimates and use map-based parcel information. Detailed land surveys and property assessments would be conducted during final design and subsequent real estate transactions. However, the project staff have conducted multiple field visits and surveys as part of the design and environmental process.

If access to a property is lost due to the project, that property becomes a full acquisition because Sound Transit cannot leave a property owner with no access to their property. That is one factor considered when the agency determines what type of acquisition (full or partial) is needed.

I-195-001 come out there and take a physical look at the properties a lot -- a lot stronger than they have. When you're doing an environmental study, you really need to come out and look at the property a little bit better.

Our property, for instance, we're -- we've got it registered as a wildlife sanctuary and planting, you know, natural flora, like it was a hundred years ago. We're moving back and back and trying to get rid of all the blackberries that we haven't taken out.

I-195-002 So the worst-case scenario that we were cited with was ground-level parking would -- and then I also heard about bringing the train to street level would force construction in such a fact -- manner that they would have to reconfigure Fifth Avenue that goes behind our property. And I don't support that configuration. That would be on ground-level parking that was spread out and take a lot of real estate.

So also, I am a supporter of the project. I am a supporter of light rail. It's been a long time coming, needs to happen. But again, like the gentleman said, reevaluation of how the land is configured and what you need to take as a footprint should have a lot of physical, you know, study. Come out and look at those properties.

This is all relative to the 185th Street station, by the way. I don't think I mentioned that.

I-195-002

Thank you for your comment stating your overall support for the Lynnwood Link Extension project and your concerns about potential adverse effects of station parking and reconfiguration of Fifth Avenue NE. Please see the updated conceptual design drawings in Appendix F. The Preferred Alternative would realign Fifth Avenue, but it does not feature ground level parking.

So anyway, that's pretty much all I have to say.
Thank you for your time.
MR. ROBERTS: Thank you.
I think this is a good opportunity to remind and repeat that staff will be here until eight o'clock. I think the -- for instance, the concerns that Mr. Ralston raised would be good concerns to make sure -- and I suspect you already have -- to be talking with the staff about those.
So I invite, at any point following our testimony, you to please raise these concerns with the staff and have dialogue there as well. Next is Dan Jacoby.

MR. SREIBERS: My name is Gunars Sreibers. That's G-U-N-A-R-S, S-R-E-I-B-E-R-S. And I'm representing the Latvian Lutheran church and community center at 11710 Third Avenue Northeast.

I-196-001 Well, here we are at Workshop 4 here -- Workshop 4, Hearing 4 for this project. I've attended every one of those workshops, every one of these hearings and made comments at every one of these. I think it's noteworthy that if you look at the attendance sheets for these last four open houses and workshops that it has had a large participation by members of the Baltic community, if you look at the names on that list.

Many have already commented on this project as part of this process, but many more are going to comment before the end of this period -- comment period. This project is -- really cuts at the heart of the Baltic community and Latvian community here the Seattle -- Pacific Northwest.

I think it's also important to note that if you look at the attention at the open houses, it was primarily Baltic people. But also we had an informational meeting, before these open houses even happened, at the Baltic -- at the Latvian center. Over 200 people attended that information session, and that was on short notice in the middle of summertime when people were on vacation. In fact,

I-196-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

a large part of the community was in Latvia celebrating a national celebration there. So there is a big deal and has gotten the attention of all of us.

The church and the center are extremely important the us both culturally and socially. We think that it should also be important to sound transit.

We're extremely disappointed, obviously, that the draft EIS failed to acknowledge the social and cultural aspects of our church and our center and its role here in the Pacific Northwest. I-196-001

I think there's one other thing I'd like to make clear, we do not oppose this project. We -- if you talk to members of our community, we're very supportive of the light rail project and really feel that it's a project that needs to be built. We just strongly believe that any option selected can be modified in such a manner that the Latvian center can continue to function during construction and continue to function in its current location after construction. We truly believe that's the case if people are willing to look at options creatively.

I also want to remind folks -- and this is very ingrained in our community -- the fact that we have been subjected to eminent domain, the taking of our property, once before. We had to rebuild this center once before. We do not feel that it is fair to be subjected to that one more

I-196-001 time again. We just want to exist at our current location and continue to do what we're doing right now, support the light rail project. Anything else short of allowing us to exist at our current location, continue to exist as a cultural hub and a social hub for the Baltic communities here in the Northwest would just be unacceptable to us.

Thank you.

MR. ROBERTS: Thank you, Gunars.

Next, I have Edvins Circenis. And if I -- I'm sure that name will sound better when you say it and spell it than what I just did to it.

///

MS. WIEST: Inte.

MR. ROBERTS: Inte.

MS. WIEST: And actually, it's Wiest.

My name is Inte Wiest, I-N-T-E, W-I-E-S-T. I live at 2030-151st Place Southwest, Lynnwood, Washington. I also am a member of the Latvian Lutheran church and Latvian community. I'm the vice president of the Latvian Association of the State of Washington and the secretary of the Ladies League of the Latvian Lutheran church and the assistant librarian at the library at our center.

Along with Edvins and many other Latvians, my father and brother, who, by the way, lived in Shoreline, worked many, many hours to help build this church on evenings, after work, on weekends.

I-197-001 I cannot begin to tell you how important this center is to me personally and to the whole Latvian community and to many, many members of the Estonian and Lithuanian communities as well.

People of all ages from prekindergarten children who study at the Saturday school to pensioners who attend services at the church and meet regularly at the center for lunch and cultural programs, the young people who practice folk dancing and give performances there, and people of all ages singing in the choir, this is a vital place. Much of our time away from our work and duties at home is spent at

I-197-001

Thank you for your concerns about the potential displacement or relocation of the Latvian Evangelical Lutheran Church and for highlighting its significance to the region's Baltic community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained.

I-197-001 center. It is a vital part of our existence and defines who we are as Latvian Americans.

If we lose our church and community center a second time, we lose part of ourselves. We need to find a solution that lets us keep our church and community center and allows Sound Transit to build the rail line to Lynnwood.

Thank you.

MR. ROBERTS: Dave Earling is going to pick up the map so that we can provide them.

The next person listed to speak is Kenneth Ralston.

MR. DOLAN: My name is Chuck Dolan, D-O-L-A-N. I live at 1220 Northeast 97th Street, Seattle, Washington, 98115. I'm here as the membership vice president of Horton Creek Alliance, and I'd like Horton Creek Alliance to become a party of record for any further communications on Section A and alternative thereof.

I-198-001

A couple things I'd like to say is basically I'd like to have the comment period extended. I think it's a little bit brief for the massiveness of the document considering I didn't really even know it had been released until I saw notice of this meeting late last week.

So I think extending the comment period for the DEIS would be appropriate. And at this time, I think that's all I'd like to say at this point. Thank you.

MR. LOVICK: Thank you.

I-198-001

Sound Transit does not have a party of record designation for those interested in the project. Your address has been added to the project's mailing list, per this request. The public comment period for the Draft EIS was for an extended period of 60 days (45 days are required) from July 26, 2013 to September 23, 2013 to allow greater opportunity for public comment.

MR. LOVICK: The next person is Imants Holmquist. Come forward, please.

MR. HOLMQUIST: My name is Imants Holmquist. That's I-M-A-N-T-S, H-O-L-M-Q-U-I-S-T. I live at 1712 44th Avenue Southwest, Seattle, Washington, 98116.

I'm a member of the Latvian community. I attended the Latvian School there for about 10 years in the '80s.

My grandmother is here. She left Latvian in 1941. I was a member on the National Latvian Youth Association's Board. We met regularly at the Latvian Center here at the Lutheran Church.

I-199-001 I just want to express that the regional and cultural significance of the church is something that is invaluable, not just to Seattle, but also regionally and nationally.

I-199-002 Many of the people tonight that will express comments will start to talk about some of the impacts it's had on the West Coast affiliations with the Latvians, and some of the impacts that the track would bring would be noise, of course.

It's a church. It's also a school. I have a 2- and 4-year-old, two daughters who attend the Latvian School every Saturday, and I'd like for them to be able to hear their classroom instruction. It'd be great if when they join the choir or join the dance group, they could

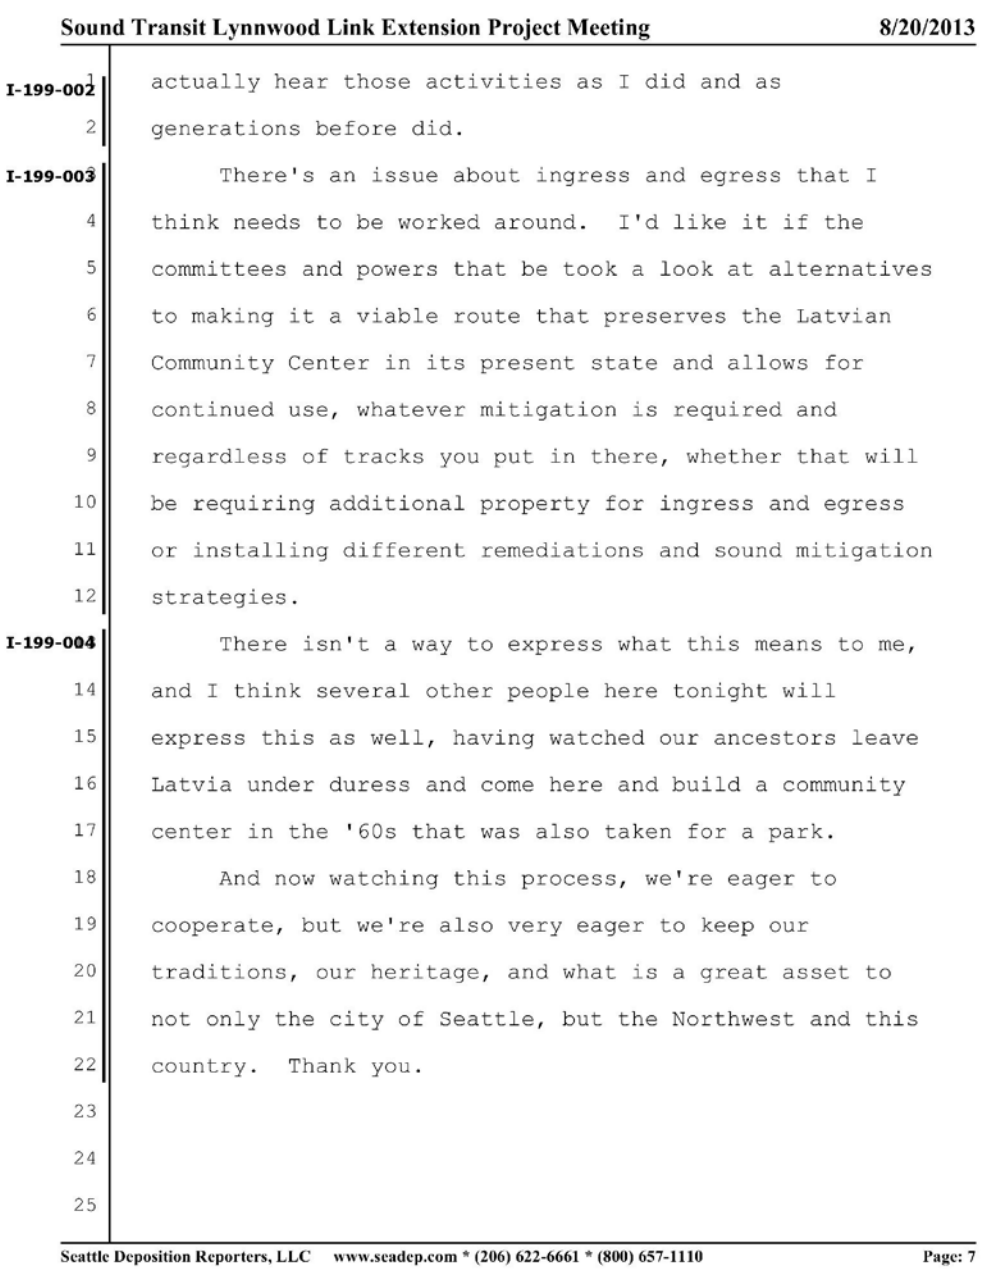
I-199-001

Thank you for your personal comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you, the region's Latvian community, the larger Baltic community, and those interested in Scandinavian studies.

I-199-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below these criteria. Sound Transit's policy is to mitigate moderate or severe impacts as per FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

The church was considered a noise-sensitive property, and the residences around the church are also noise-sensitive. For this reason, sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, any existing WSDOT noise walls removed as part of the project will be replaced.



Sound Transit Lynnwood Link Extension Project Meeting 8/20/2013

I-199-002 actually hear those activities as I did and as generations before did.

I-199-003 There's an issue about ingress and egress that I think needs to be worked around. I'd like it if the committees and powers that be took a look at alternatives to making it a viable route that preserves the Latvian Community Center in its present state and allows for continued use, whatever mitigation is required and regardless of tracks you put in there, whether that will be requiring additional property for ingress and egress or installing different remediations and sound mitigation strategies.

I-199-004 There isn't a way to express what this means to me, and I think several other people here tonight will express this as well, having watched our ancestors leave Latvia under duress and come here and build a community center in the '60s that was also taken for a park.

And now watching this process, we're eager to cooperate, but we're also very eager to keep our traditions, our heritage, and what is a great asset to not only the city of Seattle, but the Northwest and this country. Thank you.

I-199-003

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

I-199-004

Thank you for your personal comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you, the region's Latvian community, and the larger Baltic community.

MR. LOVICK: Charlene.

MS. JAUNDALDERIS: My name is Charlene Jaundalderis, C-H-A-R-L-E-N-E, J-A-U-N-D-A-L-D-E-R-I-S. I reside at 11510 Fourth Avenue Northeast, Seattle, 98125.

I-200-001 I'm an American, but I've become an adopted Latvian because I've been married to a Latvian for 50 plus years. And being raised in a small community in Yakima Valley, when I first came to the Latvian Association, I felt like I was back home because it's one community within a large city.

Since that time, they've included me in so many things, and now I am involved in our annual rummage sale that includes people from all over the Puget Sound.

People wait for it. We have increased attendance every year. The neighbors are kind enough to take our overflow of parking during that weekend, and it brings in our revenue that helps us maintain the Latvian Center for the year.

The other very vital function that we have during the year is in November we have our Christmas bazaar where the Latvian artists can bring in their things that they've made and sell it to the community as well as the parents love to come to that too because we have food and entertainment, Latvian ethnic food and entertainment, so

I-200-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church.

I-200-001

this is an indication that it's not just the Latvians that would be involved. It's also the American spouses that are involved.

I also publish the Latvian telephone directory for the State of Washington, which includes 700 plus families, which gives you an indication of how many are there. That's all. Thank you very much.

MR. LOVICK: Let's start with the first person signed up, Lori Kirsis. You have three minutes to comment, and we'll let you know when you reach the one-minute mark.

Would you spell your name?

MS. KIRSIS: Sure. Lori, L-O-R-I, Kirsis, K-I-R-S-I-S.

MR. KENNEDY: And if you could give your address, too, please, for the court reporter, that would be great.

MR. LOVICK: Yes. We will need full names, spell the name and the address for the court reporter.

MS. KIRSIS: It's 5377 44th Avenue Southwest.

I just wanted to add a personal note to the comments that you're receiving. I'm a member of the Latvian community, and I have been a member of the Latvian community my entire life.

The Latvian Church and Community Center has always been a part of my life. I've been involved with many events through my life there. I was married there. I'm a member of the Latvian choir. We practice and perform there.

I-201-001 I'm involved with fundraising for the community center and the church. I just want you to know it's a very vibrant community center, and it really will be

I-201-001

Thank you for your personal comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you and the Latvian community Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-201-001 severely affected by the current proposal, and making the Latvian Church and Community Center inaccessible is just not acceptable. Thank you.

MR. LOVICK: Does anyone else wish to comment? Step to the microphone, please.

MR. ORR: My name is Michael Orr, 1618 Bellevue Avenue, No. 302, Seattle, Washington, 98122.

I've got some notes here, but I don't really have a prepared speech. I think link in general and the Lynnwood extension is vital.

I don't have a car. I don't have a driver's license. It's difficult to get around on the buses. You really feel like a second-class citizen, and it limits the places that you can live and the jobs that you can go to.

I-202-001 Link is the biggest step forward we've ever had in this city. I think we need to do it. I think 138th Station is vital because it gives the opportunity for us to get to Lake City and northwest Seattle, two places which are kind of isolated from the rest of the city.

Regarding 145th and 155th Stations, there's good arguments both ways on those. I'm not really sure which is better. 145th is probably a little bit easier to zone with DOT, but 155th is more pedestrian friendly.

It doesn't have a lot of traffic congestion, and it's closer to 155th and Aurora. So geographically, that would be a better place if Shoreline is willing to do that.

I-202-001

Sound Transit notes your general support for the Lynnwood Link Extension project and your comments on the advantages and disadvantages of the proposed locations for light rail stations in Segment A.

I-202-002 The Mountlake Terrace Station I think needs to be on the east side of the freeway for better walking distance to the Mountlake Terrace City Center, which is a five-minute walk through the park. But if the station is on the freeway, it makes it a seven-minute walk, which is going to dampen the ridership.

The 220th station I don't know that much about, but it may be a good idea if Snohomish County residents want it.

I-202-003 For Lynnwood station, I support either the north or the west sides of the transit center because, again, those are better walking distance to the city center.

I don't support the park and ride location because it's a further walk from the city center, and there's no median walk shed. The park and ride is on one side and I-5 is on the other.

I-202-004 And finally, please don't give too much weight to the comments about Scriber Lake impacts or what you heard about the Latvian Center because we have to look at the impacts of a million people and their need for rapid transit and their need to be able to walk and bus to the rapid transit. That needs to trump any existing locations that serve a smaller number of people. That's all I have to say.

I-202-002

Your comments stating your preference for the Segment B alternatives that place the transit station east of the highway and not in the middle of the highway median are noted.

I-202-003

Sound Transit acknowledges your preference for either Alternatives C1 and C2 over Alternative C3 due to proximity to the Lynnwood city center.

I-202-004

Sound Transit appreciates your support. Sound Transit has modified the project design to minimize impacts as much as possible on Scriber Creek Park and wetlands, and the Seattle Latvian Evangelical Lutheran Church.

MR. LOVICK: And the next person is Lukas.

MR. PETERSONS: My name is Lukas Petersons, L-U-K-A-S, P-E-T-E-R-S-O-N-S. I reside at 300 North 130th Street, Unit 1201 in Seattle, Washington, 98133.

I'm a member of the Seattle Latvian community, and my parents are the caretakers of the Latvian Church and Community Center and have been for the past 20 plus years.

I-203-001

Sound transit's EIS is proposing to run the North Link Extension through our church's property and one of the alternatives is calling to eliminate our center all together.

I wanted to speak on record so we could explain how much this church and community center means to myself and our greater Latvian community.

First, our church and community center serves as a living family tree. Our Seattle Latvian family tree is not only something replicated on a piece of paper. It is a living, breathing part of this community.

The center is a gathering place for Latvian children, teens, adults and seniors alike. It is a place so important to our community and Latvian families, that it is a family tree that cannot and will not be uprooted.

Second, the DEIS understates the significance and important of our church and community center. The center

I-203-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Please see Section 2.5.1 of the Final EIS for a description of the refined Segment A alternatives that avoid displacing the church.

serves our Latvian community as a church, a gathering place, a school and a facility to many Latvian community groups that exist in our state.

In addition, it also serves as a gathering place for other Baltic Seattle communities, including the Lithuanians and Estonians.

Now I'd like to speak on why it is important to me. First, I moved here when I was eight years old and my

I-203-001

parents were asked by the church to care take the center. Their home sits on the church property.

With the proposed EIS alternative, it will not only affect my church, but it will also affect my childhood home. In addition, many Seattle Latvians live near the church in order to be close to the center, which serves as our home base to our very strong community.

Second, I attended and graduated the Seattle Latvian School along with many young Latvian children in our community. The school helps to strengthen our community and provides cultural preservation.

Third, there are many different ways that I have myself taken part in our Latvian community, all activities of which were held at our center and church.

I graduated from the Seattle Latvian School as well as taught the 4- to 5-year-old class at the Latvian School for four year.

I-203-001

I folk danced with the Seattle Latvian Folk Dance Group for seven years, and all of the practices were held and continue to be held at the center. I play Santa Claus in the Seattle Latvian School's Christmas program, and I have witnessed young Latvian children's excitement about how much they love the center and school.

I have participated in many events there as part of the catering team, which hosts celebrations on occasion for many local Seattle Latvians, including weddings, funerals, graduation and all the like.

I volunteer at many different community events, including our annual Latvian rummage sale and annual Christmas bazaar, both of which are well liked by the Seattle community at large.

In conclusion, the Seattle Latvian Lutheran Church and Community Center is and has been an important part of my life. It was a place that was built, maintained and loved by Latvians.

It has helped to shape my life and served as a symbol of strength for all of us. Our community strongly bands together to protect the heart of our community. Thank you. Also, check out our Facebook page at Save Seattle Latvian Church Center. Thank you.

MR. LOVICK: Is there anyone else who wishes to comment?

MS. PETERSONS: Good evening. I am Nikol Petersons, N-I-K-O-L, P-E-T-E-R-S-O-N-S.

I just wanted to say I am part of the Latvian community, which most of us here in this room are if you haven't noticed yet.

I-204-001 I just wanted to say that with the plan of the link rail and its running from Northgate to Lynnwood, I feel like it's a great idea.

However, taking away from our cultural environments, our church and things of that nature, I just don't feel like you guys may have taken a better look at exactly how the cultural significance of our center represents this community.

I was born in Milwaukee, Wisconsin. I moved when I was nine months to Alaska where there is another Latvian community up there.

My grandfather built a bunch of houses out there, and in turn my parents were offered the job as the caretaking -- they were offered the job to care take for the Latvian Community Center. I moved here when I was four years old.

The first language I knew how to speak was Latvian language. It was very instilled in our family. My

I-204-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church.

I-204-001 grandparents, that's all they spoke to me growing up. I actually didn't realize that my grandfather knew how to speak English. I only thought he could speak Latvian.

Anyway, I just wanted to say that I really think that the significance and importance of our center is not only for the Latvian community, but the city of Northgate, this whole neighborhood. We do a lot for them and have our rummage sales and stuff like that. Anyway, that's all I wanted to say.

MR. LOVICK: Eric.

MR. RAISTERS: Thank you. My name is Eric Raisters, E-R-I-C, last name is R-A-I-S-T-E-R-S, address is 10507 64th Place West in Mukilteo.

I-205-001 I am one of many of the Latvian community who are from all the counties of Washington. I also participate in the Folk Dance Group. We've had people that have come as far away as Bellingham and as far away as Aberdeen to participate in that group, so it brings together the community from all over.

I think you hear it from the emotions that are here exactly what the meaning of this center is and the lack of that is being brought out in the DEIS.

What I would like to comment on more than anything else is thank you to both of you gentlemen, and also in the first case of the comments period to the mayor who saw fit to come and find out about this.

I'm a little sad that in Sound Transit, the DEIS requirements, only one of the board members needs to be present at each one of the four comment periods, which means very few of them will actually get the emotion and get the information you need to base this decision.

I'm sorry that the requirement isn't that all the board should attend every single one of these at some point, and so I thank you two gentlemen for that.

I-205-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you and the Latvian community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained.

I-205-001

I hope you hear what is being said by the people here, and that's all I have to comment on. Thank you.

MR. LOVICK: And the next person is Inese Raisters.

MS. RAISTERS: Good evening. Hopefully, you can hear me. My name is Inese Raisters, I-N-E-S-E, R-A-I-S-T-E-R-S, address is 10507 64th Place West in Mukilteo, Washington. Please don't hold that against my three minutes.

I-206-001 I wish to make some comments to the Sound Transit Board tonight from a Seattle Latvian folk dancer's perspective. I am a proud American of Latvian heritage, who happens to have a passion for dance.

I'm also a member of the Seattle Latvian Church as well as a community member, and I do also sing, but tonight my story will be about dance.

I started dancing in Seattle Latvian folk dance ensemble Trejdeksnitis, which was founded in 1962. I directed the group for 15 years from 1992 to 2008, and I'm still a dancer in the group.

Trejdeksnitis just returned from participating in the fifteenth Latvian Dance Festival held in Riga, Latvia at the beginning of July. There were 25 of us there, but the group usually has around 30 people in it in any given year.

Trejdeksnitis has performed at Northwest Folklife on numerous occasions as well as at downtown Seattle Public

I-206-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church.

I-206-001 Library and at Skandia Midsommarfest, both in Poulsbo and at the newer St. Edwards State Park location.

Our group depends on having the Seattle Latvian Center as our rehearsal stage as well as for our annual performances, which serve as fundraisers to travel to many of the festivals we dance at.

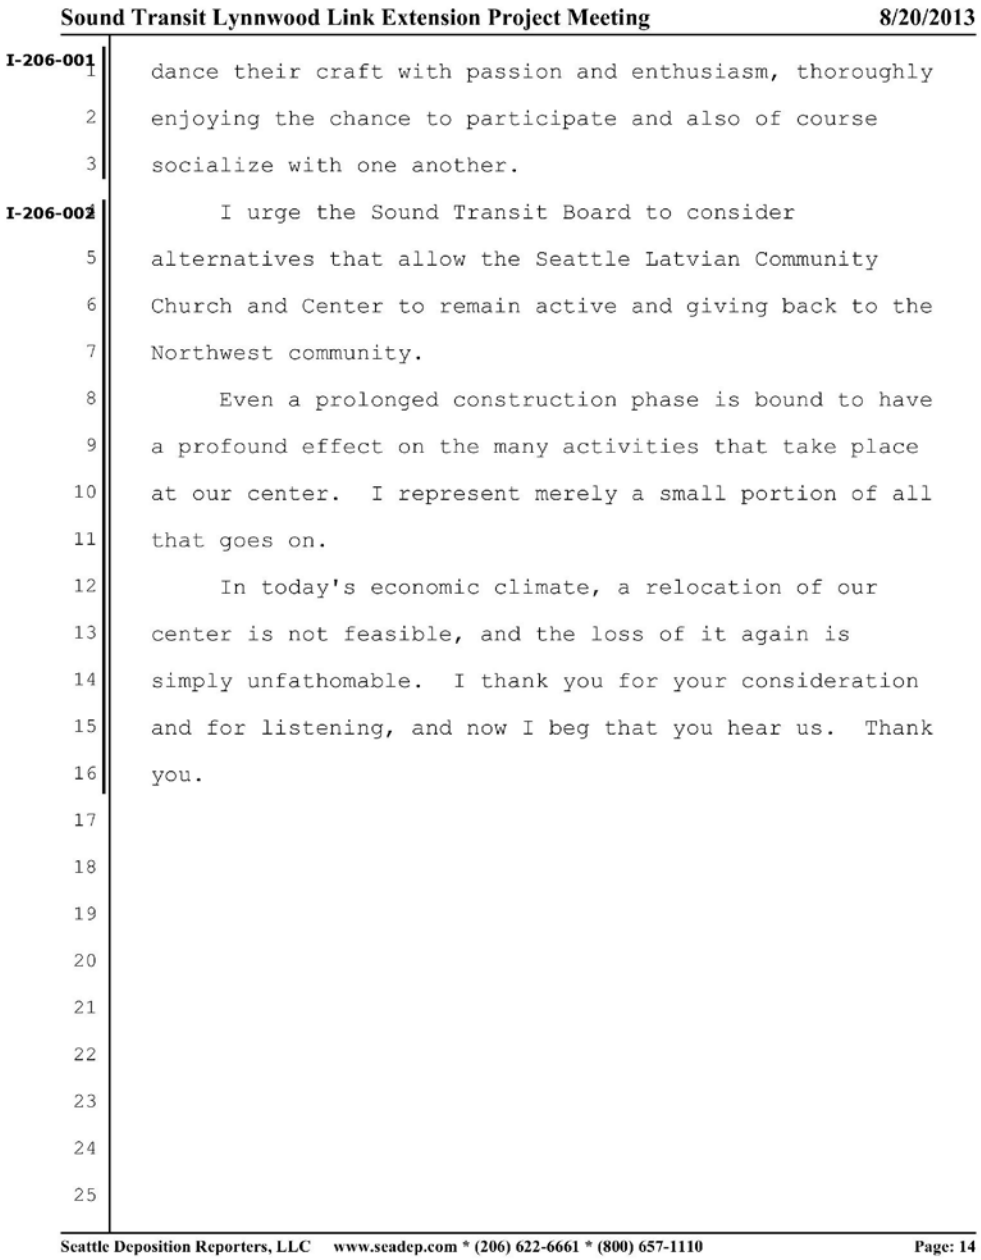
I can't even imagine, nor would I want to what would happen to the weekly activities of this wonderful group if the Seattle Latvian Center is no longer accessible to Trejdeksnitis.

We have persevered for 51 years so that we may continue to demonstrate and engage in our rich Latvian cultural heritage.

At least four of our members have created numerous award-winning dances at festivals across the U.S. and Canada. Some of our former dancers have moved to other American cities and in turn led the Latvian dance groups there.

Our members range in age from teenagers to what you see standing in front of you. Our young dancers are spending their time learning dances, often with intricate steps, learning about the multifaceted choreographies of Latvian dances.

They are keeping physically fit, not playing video games or channel surfing on the couch at home, and they



Sound Transit Lynnwood Link Extension Project Meeting 8/20/2013

I-206-001 dance their craft with passion and enthusiasm, thoroughly enjoying the chance to participate and also of course socialize with one another.

I-206-002 I urge the Sound Transit Board to consider alternatives that allow the Seattle Latvian Community Church and Center to remain active and giving back to the Northwest community.

Even a prolonged construction phase is bound to have a profound effect on the many activities that take place at our center. I represent merely a small portion of all that goes on.

In today's economic climate, a relocation of our center is not feasible, and the loss of it again is simply unfathomable. I thank you for your consideration and for listening, and now I beg that you hear us. Thank you.

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 14

I-206-002

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other alternatives.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations. Construction period mitigation is also defined for each environmental topic, and Sound Transit anticipates that the center's activities would be able to continue during construction.

MR. LOVICK: Gunars Sreibers. Please give your name and your full address.

MR. SREIBERS: Thank you. My name is Gunars Sreibers, that's G-U-N-A-R-S, last name, Sreibers, S-R-E-I-B-E-R-S, and I'm representing the Latvian Lutheran Church and Community Center located at 11710 Third Avenue Northeast in Seattle.

I-207-001 The Baltic community as a whole is extremely disappointed with the Draft EIS's lack of recognition for the social and cultural contributions of our community and that this facility provided to Seattle and the Pacific Northwest.

The center is the hub for all activities Baltic throughout the region. It is used by and truly represents thousands of individuals of the Baltic heritage and their friends.

The Draft EIS fails to address any of the construction impacts or long-term operating impacts that the light rail project will have on the numerous ongoing events and activities that take place at the center.

The center serves the Latvian, the Lithuanian and Estonian communities, providing multiple programs ranging from toddlers to seniors. It is a focal point for a multitude of religious, cultural, educational and political activities which are Baltic.

I-207-001

Thank you for you comments describing the importance of the Latvian Church and community center to you and the Baltic community, as well as providing some historical context. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained.

During project construction, the Latvian Evangelical Lutheran Church and its uses would have temporary impacts, but church and community center functions would be maintained. See Section 4.4 in the EIS, which discusses construction and operation impacts on social resources within the project study area.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations. Construction period mitigation is also defined for each environmental topic, and Sound Transit anticipates that the center's activities would be able to continue during construction.

I-207-001

Just to give you a glimpse of the activities that occur at this center, the church services are conducted in three separate languages. The church services are each conducted independently in Latvian, Lithuanian and Estonian languages.

Special social events and unique cultural holidays are celebrated at this facility. The Children's Latvian Language School meets regularly here and has been in existence for over 60 years now.

The facility is used by national and internationally-recognized drama groups, choir groups and is also a center where actors come and give plays from Latvia.

It is a meeting place for fraternal groups representing the university students and sororities and fraternities from the University of Latvian. It is also an activity center for numerous senior groups.

The facility is used for Latvian sewing and cooking classes, and then it's used as a polling place for Baltic elections and for greeting ambassadors and presidents coming to this country and visiting Seattle.

The center serves as an organizing hub for the establishment of the Baltic Studies Program at the University of Washington and continues to be an ongoing funding source for that program.

I-207-001

Any actions that temporarily or permanently disrupt activities at the center is unacceptable to the Baltic community. Any options to close or move the center will be devastating, and in all likelihood lead to the demise of many, if not all the current activities.

In reality, it will end the Baltic community presence in the Northwest and the cultural richness it brings to the Northwest and to Seattle. The center must, and I emphasize must continue to function at its current location.

One last note, the Latvian Center and in fact the entire Baltic community has already suffered through one eminent domain taking.

In 1969 the original Latvian Center purchased in 1955 was taken from the Baltic community when the city of Seattle elected to construct the Wallingford playfield on that property.

MR. LOVICK: Sir, you need to summarize your comments.

MR. HOLMQUIST: I'm just about done.

Through an outpouring of generous donations and volunteer labor by the Baltic community members, the current facility arose to replace what was taken from us. We cannot fathom being subject to another taking. Thank you.

MR. LOVICK: Next is Dzidra.

MS. UPATTS: My name is Dzidra Upatts. I'm a member of the Latvian Lutheran Church and also the Latvian Center.

I-208-001

I will speak very emotionally because I don't know how much you know about history. We are a small group of small Baltic countries. The Second World War ended very badly for us when our countries were taken over by the Soviet Union and many of us were running for our life.

When I left Latvia, I had two pairs of stockings and my rain coat, and I had a safety pin so I don't lose them. I had a backpack, and I had -- I don't know how you call it.

I will be 89 this year. In this church, I met my husband, and I got married in this church. This is the church that my daughter went to school, and she was confirmed later.

I want to say whatever happens, don't destroy this church because we can't repeat that because many people who work there, it's like a refuge for us. Whatever you will do, don't destroy it, please.

I-208-001

Thank you for your comments describing the cultural importance of the church to you and the community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

MR. LOVICK: Is there anyone else who wishes to comment? Please step up to the microphone and state your name and give your address.

MS. VETTER: My name is Sandra Vetter, S-A-N-D-R-A, V-E-T-T-E-R. I'm a proud U.S. citizen, and I'm also proud of my Latvian heritage.

I-209-001 I moved to Seattle in 1978 when I was 21 years old, and I discovered the Seattle Latvian Center and Church in the early 1980s when I started attending the annual Christmas bazaar, which is held each year in early November.

It satisfied my hunger for the taste of the food and the sound of the Latvian language. I joined the Seattle Latvian Folk Dance Group, Trejdeksnitis, in 2002 and have been a member ever since.

We rehearsed at the wonderful hall at the center each week for three hours from September through June or July. We're able to learn and share the richness of Latvian music and dance by performing at key events in the Seattle Latvian community as well as for local community events, such as the Northwest Folklife Festival.

We also perform at the North American Latvian Song and Dance Festival, and of course the epic Latvian National Song and Dance Festival in Riga.

I-209-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church.

I-209-001

This last summer we had the thrill of participating in the Song and Dance Festival, enjoying the largest group of participants in the history of the festival. Over 40,000 singers, dancers, musicians and artisans.

Our ability to travel was due in large part from the support and guidance of the Seattle Latvian Community Center and its numerous organizations.

Being able to be a part of something so culturally significant is something the younger generation should be able to look forward to. There would be a huge void if this Latvian Center home no longer existed.

Because I see the importance of learning and sharing cultural heritage, over the years my involvement in the Latvian community has deepened.

I've studied Latvian language at the UW Baltic Studies Program, which has strong ties to the center. My daughter attended the Latvian Seattle School for two years and also joined me in the dance group for four years.

I've been seen singing with the Latvian Vocal Ensemble for the two years. This wonderful collection of singers and our dedicated director rehearse at the center weekly and perform for church holidays and important cultural gatherings.

I volunteer for events and fundraisers as I can to

I-209-001

support the hard-working, dedicated and resilient people that are the roots that keep the American Latvian community alive.

The center is a beacon for Latvian Americans in the Pacific Northwest and needs to continue to act as a cultural hub and needs to be a hub for social and cultural gathering to provide people with the opportunities to network with one another, allowing experiences and information to be passed around.

The sharing of ideas is arguably one of the most important facets of a progressive society as it promotes collaboration amongst people and helps define what is commonly called --

MR. LOVICK: Sandra, you need to conclude your comments.

MS. VETTER: I have one sentence -- which is commonly called community. The unity of the Latvian community has played a huge role with preserving its culture over time.

It needs to remain as a beacon of culture, especially as younger generations may find a need to become educated about their heritage. Thank you.

MR. LOVICK: And next is Barbara.

MS. ZEPEDA: I'm Barbara Zepeda, Z-E-P-E-D-A, and I live in the middle of Seattle. I've spent all my life fighting freeways in this city.

A lot of my friends are dead. They lived out here. All the people from the north end in Lake City all the way down into Seattle have done what none of our elected officials have done, and that is try to get withdrawal and substitution and build transportation and not asphalt.

I-210-001 The legal announcement of this meeting said it was on 15th Northeast, and to me this is very typical of the way we do our politics in the city.

I-210-002 There's no numbers here about the cost. There's not even any mention of what I just heard because I was late driving over here. I figured out it was here instead of over on 15th.

We use four times our allotted amount of energy. Europe uses twice as much as the world environmentalists' assessment of energy use per capita.

We use four times what most people in the world use, and half of our energy use is to get back and forth to work in urban areas of a million people.

These are figures we had when those of us were fighting for rail in the '60s and '70s. We in the

I-210-001

Sound Transit used several methods to advertise the Draft EIS public open houses and hearings that included the accurate address, including project website, postcard notice, print and web ads, email to the project listserv, posters, community calendars and blog advertisements. The name of the facility at which the meetings were held was also included so that people have all the information they need to find it. The legal ads placed in the newspaper used the correct address.

I-210-002

Project costs are discussed in both the Draft EIS and Final EIS in Section 2.7 of the Alternatives Considered chapter and in Section 5.3 of the Evaluation of Alternatives chapter.

Democratic Party got withdrawal and substitution into the law through Magnuson, but all the elected officials except for Royer refused to allow us to be on the ballot to build rails like Portland did.

They got their 18 miles of rail for less than a billion dollars. We're so stupid that we're building an internal combustion tunnel that's four times in diameter and 10 times the cost of a subway system tunnel.

We still do not have rail transportation as an alternative. In fact, we have to have a car because we design parking lots to use our transportation system, our public transportation system.

This is so insane, but it is the obvious result because the only time any of our national media actually printed the facts about the conspiracy was in February of '81 in Harper's magazine.

This was a lawsuit because all of the rail was built by the municipal ownership and populace that took over urban areas and built inner city rails at the beginning of the last century.

They did it because they wanted to have jobs and small business that made communities, and now what we have is a system where this is no people who run the transportation system, who design it --

MR. LOVICK: Barbara, we're going to have to

ask you to wrap up your comments, please.

MS. ZEPEDA: We have to have subways. We have to have real rail systems. We can't be building parking lots and paving over all of our land and making everybody use a gallon of gas every day just to get back and forth to work.

LYNNWOOD, WASHINGTON; WEDNESDAY, AUGUST 21, 2013

5:50 P.M.

--o0o--

MR. BARTHOLET: My name is David Bartholet, B-A-R-T-H-O-L-E-T. I live at 20316-52nd Avenue West, Lynnwood, Washington 98036.

I-211-001 My concerns with the C1 and C2 route is that it will directly affect many houses, families, and the properties that we've worked so hard to buy and own and I-211-002 maintain. I feel the C1 and C2 route would affect the wetlands that are nearby, the public access that our families use to walk -- to walk our pets and to just enjoy the wetlands that are there.

Years ago there was a lot of money put into maintaining and enhancing the wetlands. And we'd kind of like to keep it that way. So in short, I propose the C3 route be the best alternative for everybody involved.

That's it.

///

I-211-001

Sound Transit noted your concerns about the neighborhood impacts of Alternatives C1 and C2.

I-211-002

Thank you for stating your concerns about the C1 and C2 alternatives' impacts on the Scriber Creek park and wetland area and your support for Alternative C3. The Preferred Alternative in the Final EIS is a modified version of Alternative C3. See Chapter 2 for further details.

MS. ESCAMILLA: Escamilla.

MR. ROBERTS: Thank you.

MS. ESCAMILLA: Hello. So --

MR. ROBERTS: Can we just -- could you go ahead and spell your name.

MS. ESCAMILLA: I will. I will. Okay.

MR. ROBERTS: Okay, good. And your address.

MS. ESCAMILLA: So it's D-E-R-I-C-A; last name, Escamilla, E-S-C-A-M-I-L-L-A. My address is 20806-52nd Avenue West. So I'm right on the corner of 52nd and 208th Street.

And just for some context, can I get a show of hands of everyone that lives on 52nd Avenue West?

I-212-001 Okay. I would like to ask Sound Transit how you would feel sitting in your living room looking out your window at an elevated structure right across the street from your house? I have measured it, and it is approximately 70 feet from the corner of my fence line where the elevated structure would go in. I measured it with your figures, and it's -- it's within, like, five feet.

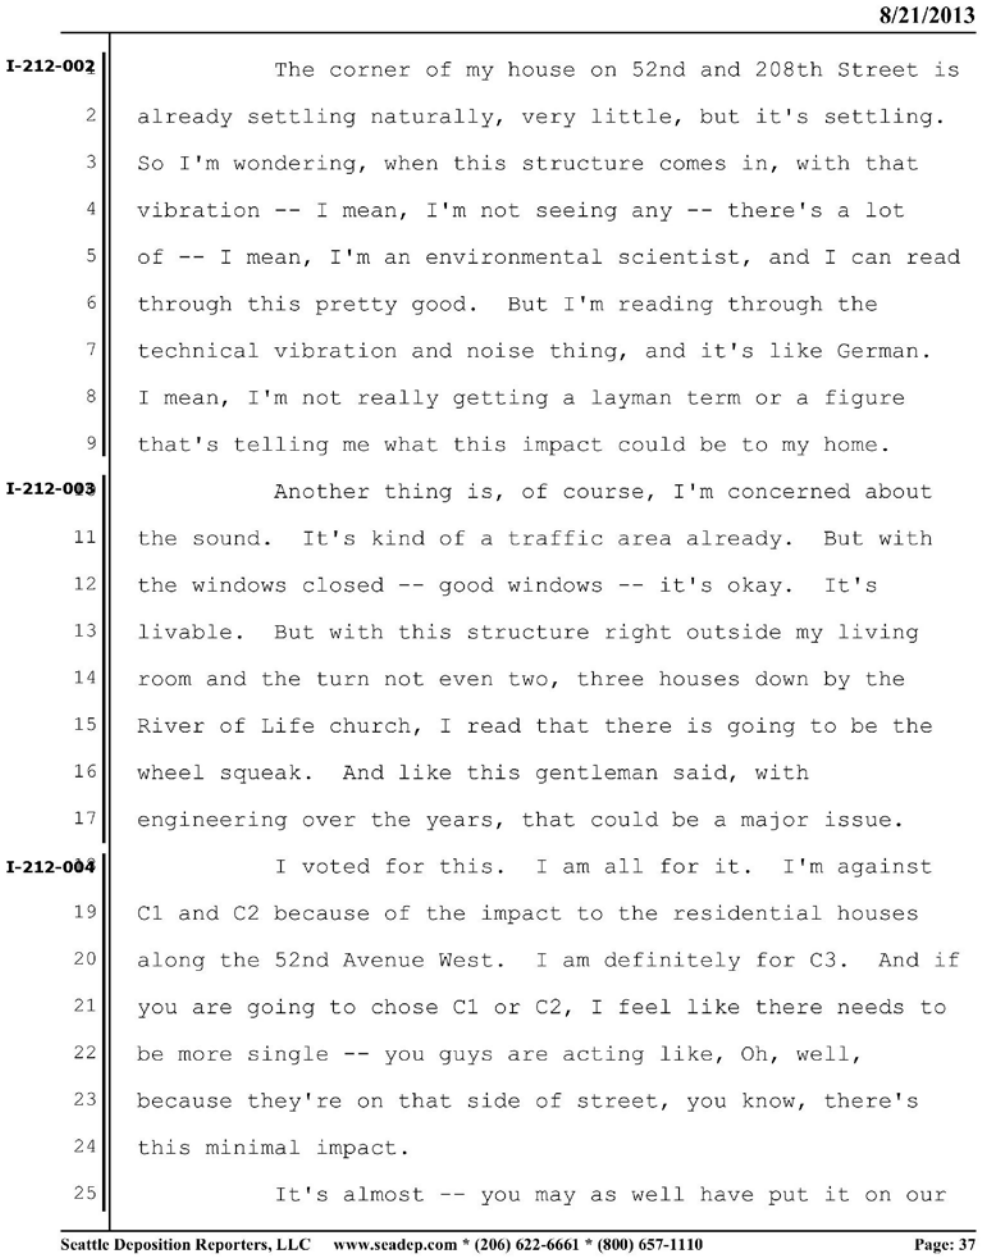
I-212-002 And so my big concern, I read through the whole draft EIS, and I just feel like there's not enough -- I'd like to see a figure that talks about, in distance to the footings of this elevated structure, what are the vibration impacts going to be, since I am so close.

I-212-001

This concern is consistent with the Draft EIS discussion of impacts on page 4-81, which concludes that the elevated guideway at this location would visually intrude upon the integrity and unity of this residential area and result in high level of change in visual quality. The Draft EIS discussed potential mitigation measures for visual quality impacts in Section 4.5.6. Proposed mitigation measures for visual quality impacts are refined in the Final EIS Section 4.5.6. The Preferred Alternative does not follow 52nd Avenue W.

I-212-002

There were few locations with vibration impacts in the corridor, and all impacts above FTA criteria will be mitigated. Attachment D, Vibration Impacts by Build Alternative, of the Noise and Vibration Technical Report lists the projected vibration levels, the distance to the nearest track and the FTA threshold for vibration impact (i.e., criteria) for each vibration sensitive receiver by alternative. Vibration impacts are expected when the projected vibration levels are equal to or greater than the FTA criteria. The table in Attachment D identifies the projected vibration levels in bold face font (in red) wherever vibration impacts are expected.



8/21/2013

I-212-002 The corner of my house on 52nd and 208th Street is already settling naturally, very little, but it's settling. So I'm wondering, when this structure comes in, with that vibration -- I mean, I'm not seeing any -- there's a lot of -- I mean, I'm an environmental scientist, and I can read through this pretty good. But I'm reading through the technical vibration and noise thing, and it's like German. I mean, I'm not really getting a layman term or a figure that's telling me what this impact could be to my home.

I-212-003 Another thing is, of course, I'm concerned about the sound. It's kind of a traffic area already. But with the windows closed -- good windows -- it's okay. It's livable. But with this structure right outside my living room and the turn not even two, three houses down by the River of Life church, I read that there is going to be the wheel squeak. And like this gentleman said, with engineering over the years, that could be a major issue.

I-212-004 I voted for this. I am all for it. I'm against C1 and C2 because of the impact to the residential houses along the 52nd Avenue West. I am definitely for C3. And if you are going to chose C1 or C2, I feel like there needs to be more single -- you guys are acting like, Oh, well, because they're on that side of street, you know, there's this minimal impact.

It's almost -- you may as well have put it on our

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 37

I-212-003

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below these criteria. Sound Transit's policy is to mitigate moderate or severe impacts as per FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, any existing WSDOT noise walls removed as part of the project will be replaced.

Wheel squeal only occurs on tight radius curves, not on a straight track, like the ones along this segment of the corridor. For areas with tight radius curves, trackside lubrication will be used to mitigate wheel squeal.

I-212-004

Thank you for your comments stating your overall support for the Lynnwood Link Extension project and your opposition to Alternatives C1 and C2 and reasons why.

I-212-004 side of street. It's the same thing. It's still going to be there. We're still going to see it. We're still going to feel the effects environmentally, physically, and aesthetically. And I really feel like there needs to be more focus on us single-family residential homeowners that live along 52nd Avenue West.

That's all I have to say. Thank you.

MR. ROBERTS: Thank you.

So those are all of the persons who have signed up for comment. Is there anyone who would like to make a comment? Please come to the mic.

Or if not, I just want to make sure you know that there are all sorts of ways to comment. We're going to be here tonight until eight o'clock to answer questions or if you want to look at a little more of the detail or talk about some of the concerns that you have. So those are all available to you.

Is there anyone else who would like to address us tonight?

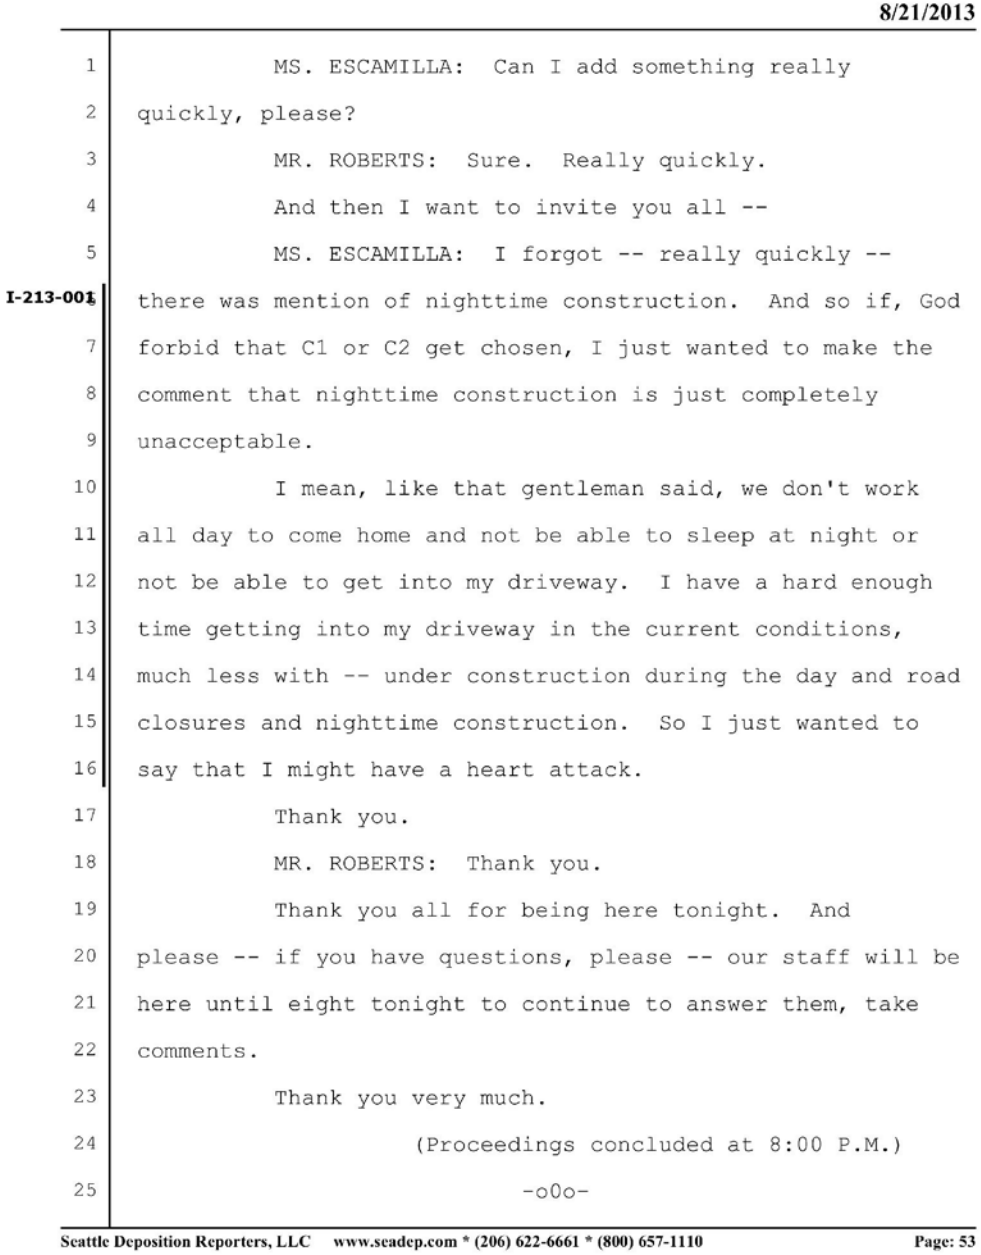
Please come forward and give us your name and address please. And if you wouldn't mind, spell it.

///

///

///

///



8/21/2013

MS. ESCAMILLA: Can I add something really quickly, please?

MR. ROBERTS: Sure. Really quickly.

And then I want to invite you all --

MS. ESCAMILLA: I forgot -- really quickly -- there was mention of nighttime construction. And so if, God forbid that C1 or C2 get chosen, I just wanted to make the comment that nighttime construction is just completely unacceptable.

I mean, like that gentleman said, we don't work all day to come home and not be able to sleep at night or not be able to get into my driveway. I have a hard enough time getting into my driveway in the current conditions, much less with -- under construction during the day and road closures and nighttime construction. So I just wanted to say that I might have a heart attack.

Thank you.

MR. ROBERTS: Thank you.

Thank you all for being here tonight. And please -- if you have questions, please -- our staff will be here until eight tonight to continue to answer them, take comments.

Thank you very much.

(Proceedings concluded at 8:00 P.M.)

-o0o-

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 53

I-213-001

For construction, the local construction noise ordinance would be applicable, and Sound Transit is committed to maintaining construction noise levels within the criteria. Further, construction noise for this project is similar to construction noise for a paving project, building construction or any other construction project and Sound Transit works with local residences and business to minimize construction impacts.

For nighttime construction, which may occur during some periods due to the heavy volumes of traffic on I-5 and other arterial roads, a noise variance would be required from each of the cities where construction would be performed. During that time, Sound Transit will work with the local jurisdiction to arrive at construction specifications that minimize construction impacts to nearby communities. Whether construction occurs during the day or at night, Sound Transit would maintain access to adjacent properties.

MR. GOODMAN: Hi. My name is Eric Goodman. I live at 8010-181st Place in Edmonds. I'd like to speak today --

MR. ROBERTS: Would you mind spelling your name?

MR. GOODMAN: Eric, E-R-I-C; Goodman, G-O-O-D-M-A-N. I'm a strong supporter of this project. I look forward to having light rail come to Lynnwood. I do use the light rail, sometimes, that exists now.

I-214-001

I agree with many of the other commenters that C3 is probably the best alternative through Lynnwood because it has the least impact. I also believe that C3 is good for pedestrians. Especially if you could link it to the pedestrian bridge that currently crosses 44th Avenue. I think it will have a better linkage for pedestrians into the core of what Lynnwood foresees as their downtown.

I-214-002

And the other topic I wanted to speak about is the 220th Street station. I think it's important to have a station there at some point in the future to serve the dense employment in that area. I don't know that the alignment as it's projected right now is -- is the best. I'd like to see something lower, closer to grade, maybe under the street rather than over it.

And I understand that the ridership and the cost may make it so that that station doesn't pencil out at this point in time. But a lot of employees in that area actually

I-214-001

Your comments stating your overall support of Sound Transit's light rail expansion program and your support of Alternative C3 are noted.

I-214-002

Thank you for your comment stating your support for the construction of a light rail transit station at 220th Street SW under Alternative B2A. Alternative B2A would be at-grade until south of the station. The guideway would be elevated to go over both the southbound on-ramp to I-5 as well as 220th Street SW and then continue with at-grade and cut-and-fill sections depending on topography as the route continues to the north. The Final EIS also evaluates an option for a potential station on the south side of 220th Street SW with the Preferred Alternative, as described in Chapter 2.

I-214-002

come from the north, so I would like you to study what happens in the future as light rail is extended up to Ash Way and eventually, maybe to Everett. If that station becomes more viable, possibly we don't build it now, but we allow for it to be built at a point in the future when it draws more ridership.

So thank you all for your work in being here, and please choose less impact.

MR. ROBERTS: Thank you.

Next, we have Jeff Shannon.

MS. KINMAN: Karen Kinman. And it's 5308-202nd Place Southwest.

And I just wanted to -- I was really -- I'm really happy to hear the comments tonight because I wasn't really clear on all the different alternatives. And now it's crystal clear.

I mean, when -- I guess what I want to talk a little bit about is just living in Lynnwood. And it's not the kind of place you really think about, I'm going buy a house and live in Lynnwood. You just end up living here sometimes. We raised our kids here. We raised our kids and we -- it's just like the best place to live. And this neighborhood that we ended up in is where everybody is making comments on. It has such a character and has such as culture to it.

We -- you know, my kids when they went to college and come home with their friends, they'll take them to Talay Thai and Kalia or JD's Market. And there's just a friendly diversity and trees and all of the wildlife that everybody talks about. It's not -- the feel is not big trains overhead, Bellevue sky rises and stuff. The feel is quaint and hometown.

I-215-001 And you know, it's fine if they want to make a city center, but I think there's other ways we can get people from the city center to the bus or the train station

I-215-001

Thank you for expressing your concerns for potential impacts to residences, businesses, and landscaping as a result of constructing one of the Segment C alternatives for the Lynnwood Link Extension project. The Draft and Final EIS analyze the potential impacts of project alternatives in Section 4.1, (acquisitions), 4.3 (economics), and 4.5 (visual impacts. The Final EIS includes mitigation measures refined since the Draft EIS.

I-215-001 without tearing out businesses and people's homes and ruining the scenery and the trees.

I guess that's about all. Thank you.

MR. ROBERTS: Thank you. Thank you.

Yes?

MR. LOVITT: My name is Douglas Lovitt. My address is 5321-202nd Place Southwest in Lynnwood.

MR. ROBERTS: Would you mind spelling that?

MR. LOVITT: Yeah. It's L-O-V-I-T-T.

I am about four -- about four blocks from the most heavily-impacted area. Many of these people here tonight are my neighbors. And I want to say that I did have -- I did have an absolutely wonderful meeting with people in the Cedar Creek Condominiums the other night. And I have to tell you, I'm really surprised at their openness and willingness to want to see Sound Transit in Lynnwood. It -- throughout the entire community, I am hearing things that people want transit here.

I-216-001 But what I am hearing is that the one route, the C1 route -- and C2, which cuts through the middle of the park, those are such high-impact routes and so high-cost routes. I don't hear anything about impact -- impacts to property values. I hear a lot about environmental impacts. All of those are legitimate. And all of that stuff can be minimized simply by going with C3.

C3 keeps the corridor -- the transit corridor to -- located in an area where we already have transit. We already have I-5. It minimizes the noise impacts; it minimizes the environmental impacts; it minimizes the property values; it minimizes the litter, the graffiti, all

I-216-001

Your preference for Alternative C3 is noted. Section 4.3 of the Draft and Final EIS address potential property value impacts.

I-216-001

of the -- all of the impacts that we would have with C1 or C2.

So I applaud my neighbors for coming up here tonight and being here tonight. I -- it takes a -- it takes a great deal of fortitude and courage to get up here and speak. And I appreciate the comments. I hope Sound Transit is listening.

Thank you.

MR. ROBERTS: Thank you.

Is there anyone else who wishes to address us tonight?

Yes, sir. If you'll give us your name, and spell it, and your address. Thank you.

///

///

///

///

///

///

///

MR. MAYES: My name is Mike Mayes, M-A-Y-E-S. I own a company called Mayes Testing Engineers, and unfortunately, C2 goes right through my building. So obviously, I don't like that one.

I think the gentleman before me was pretty eloquent. I also support the light rail. I see no reason for C1, C2. That's a really nice residential street. It -- C1 takes my parking away. It -- it really screws up all those businesses right there. And I would hate to have a house there. I can't imagine what people who live on that street would think about this, to have this 40-foot massive structure come there through there.

C3 seems to be mostly undeveloped land. It seems to be a straight shot. I've heard that, you know, people might have to walk a little farther, but it seems like that could be easily mitigated by rearranging the bus line.

So I'd say build C3, seems to be way to go. It's the right -- the right approach. And it would be great to have the line come to Lynnwood, but not through our businesses and homes.

Thanks.

MR. ROBERTS: Thank you. Would you mind giving either your business or --

MR. MAYES: Oh, okay. The address is 20225 Cedar Valley Road.

I-217-001

Your overall support for the Lynnwood Link Extension project and your opposition to both Alternatives C1 and C2 is noted.

I-217-002

Your comment stating your preference for Alternative C3 is noted.

MR. ROBERTS: Thank you.

Next, I have signed up Gunars Sreibers.

///

///

MR. MCDONALD: Thank you. My name is Kevin McDonald, and my address is 20111-46th Avenue West.

MR. ROBERTS: McDonald, as in, M-C, capital D?

MR. MCDONALD: Yeah. M-C, capital D-O-N-A-L-D, yeah.

MR. ROBERTS: Thank you.

MR. MCDONALD: And I just wanted to expand a little bit about the -- the amount of spaces that you may have. I share a property line with that -- with your existing park-and-ride right there. And I have park-and-ride customers parking on my property all the time, which I'm fine with because I realize that it's over capacity and everybody is just trying to get to work and make a living and, you know, get through the day. So I don't go and tow those cars off the parking lot.

But if you guys are going to funnel all the -- or funnel as much as you can from up north until you get funds to, maybe, further extend line, I don't know whether 500 spaces is going to be -- only adding 500 spaces is going to be enough. Because as that gentleman expanded on and said that it's -- was over capacity from day one and continues to be, quite a bit.

So I don't know whether there's -- as you guys continue to look at it, if there's any way -- as you build a parking structure, that you could add more than the 500

I-218-001

I-218-001

The Final EIS considered options for additional parking for both Lynnwood and Mountlake Terrace stations, beyond the added spaces considered in the Draft EIS. In both locations, the additional parking beyond the added spaces assumed for the Preferred Alternative tended to worsen traffic impacts and did not markedly change ridership. The transit improvement with light rail also frees service hours for local transit operators, who could then increase service to the station, reducing parking demand. Mitigation measures to address spillover parking are described in Section 3.6.7.

I-218-001 spaces, whether it's economically feasible or environmentally feasible, but maybe that's something further to look at.

So that's all I wanted to say.

MR. ROBERTS: Thank you.

Thank you. Is there anyone else who wishes to address us here? Anyone else?

MS. MONAHAN: Hi. Mary Monahan, 5214-201st Place Southwest, Lynnwood. And I am addressing the Lynnwood Link extension.

I-219-001 Okay. First of all, I think we need light rail to Lynnwood, and I voted for it. But we have three alternatives, and it is a quite obvious one to me that C3 is the less intrusive and has less impacts to our neighborhood and community and wetlands.

I-219-002 I am deeply concerned about all the impacts the whole project will have to our wetlands and the visual impacts to our neighborhood. This project seems so intrusive and massive and dangerous to our way of life. We, on 201st Place Southwest, down by Sprague's Pond and Mini Park, will also be impacted visually by the skyline and loss of old-growth vegetation and trees in the Scriber Lake Park and along 52nd Avenue and 200th. There is no way Sound Transit can give all of this back after construction. These trees are old growth and a buffer to freeway noise.

I-219-003 How can you expect us to embrace a cold and cruel cement jungle over old-growth vegetation and trees and wetlands with turtles; cutthroat trout; salmon spawning; dragonflies; butterflies; birds of all kinds, including eagles, blue herons, wood ducks, Canadian geese; also raccoons, possum, beaver, river otter, frogs, and crickets, and the serene sound of birds which have a calming effect

I-219-001

Your comment stating your overall support of the Lynnwood Link Extension project and your reasons that Alternative C3 is your preferred route for Segment C is noted.

I-219-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below these criteria. Sound Transit's policy is to mitigate moderate or severe impacts as per FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Visual impacts and mitigation are addressed in Section 4.5 which notes that the project would remove mature vegetation, which takes years to grow to restore screening.

I-219-003

The Preferred Alternative features modifications that help minimize wetland impacts and vegetation loss in several locations. It avoids an alignment along 52nd Avenue or 200th or adjacent to Scriber Creek Park. Even if other alternatives move forward, this project will abide by all applicable federal, state, and local environmental laws and regulations, including tree replacement requirements. Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure there is no net loss of ecosystem function and acreage as a result of agency projects. Please also see Section 4.5.6 for usual impact mitigation measures.

I-219-003 rather than the stressful sounds of light rail.

Also the frogs have come back. Just a week ago, we had six turtles come up our street and try to lay eggs in the rocks right on our street.

I-219-004 This a protected wetland area labeled 4(f). And as Linda said, right on the sign it says -- Scriber Creek Park sign, says -- excuse me -- Funded by -- in part, by Conservation Futures grant.

I-219-005 According to Page 481, C1 and C2 have high visual impacts. Elevated guideways on east side of 52nd Avenue West would visually intrude upon the integrity and the unity of the residential area.

According to Page 4 -- or Section 4, Page 59 and 60, by the DEIS, both C1 and C2 would feature design measures to avoid noise impact, but the elevated guideways would change views. And alternatively, C3 would have the least effect on the neighborhood because it is largely adjacent or parallel to I-5.

I-219-006 We live in very special area that many people don't realize what we have here in Lynnwood. It's our little paradise of wetlands all in walking distance. It's our little -- don't think -- okay -- I just don't think the City of Lynnwood appreciates what we have.

Please choose C3 of the Lynnwood Link extension.

Thank you.

I-219-004

The Section 4.18 4(f)/6(f) analysis has been updated to note that Alternative C1 would not be implementable under its current configuration. Section 4.17 was updated to note the funding source for the park.

I-219-005

Your comment opposing the elevated alignments C1 and C2 near the neighborhood is noted.

I-219-006

Thank you for your comment stating your preference for Alternative C3.

MR. ROBERTS: Thank you.

Next, I have Derica Escamilla -- Escamilla.

MR. RIEKSTINS: It's Valdis Riekstins. Last name is R-I-E-K-S-T-I-N-S. My address is Woodinville, but I'm here -- I'm here to actually speak about the Latvian Lutheran church that's actually more -- closer to the Northgate area.

I'm a member of the Seattle Latvian community. I was born into it. And this structure stands as a living landmark to our community. This is a facility that was designed, financed, and built by my grandparent's generation. A generation that was driven by their homeland by war. They were forced from their homelands with little to nothing to their name and fought their way to this country to start a new, better life for their families.

And together with like-minded individuals, they decided to create a center to teach the language and the customs to their children and their children's children to preserve their customs here in this land until their country was free again.

I-220-001 I noticed on -- I noticed on your boards that this facility is listed as a church. And I need this board to understand that this facility is so much more than just a house of religion. It is a hub for our Baltic-American communities in the Pacific Northwest that houses a Latvian Saturday school that I myself attended, that my children will be returning to next month. It is home to so many

I-220-001

Thank you for your comments on the cultural importance of the church and center. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church and community center. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement. None of the Segment A alternatives evaluated in the Final EIS would displace the church or hall.

I-220-001

Baltic arts and performances, folk dance rehearsals that my parents met and fell in love at, that my wife and I rehearsed at before we were married.

This facility is crucial to our communities, and we cannot see it demolished or any way diminished. It serves as a monument to those in our community who are no longer with us who built it so we could have it for our children and their children.

I -- I implore this -- this committee -- I -- I -- you must preserve this center. It cannot be replaced; it cannot be substituted; it can -- we cannot be compensated for it. It is priceless to our communities. And any consideration of elimination of this facility cannot -- cannot be considered. Thank you.

MR. ROBERTS: Thank you. Gleb Shein.

Can you give us your name and address and spell it for us? I probably didn't do it justice.

///

///

///

///

///

///

///

///

MR. SHANNON: Yes. I'm back here. I'm going to have to stay where I am. I'll speak loudly if I -- as much as -- as loudly as I can. It's J-E-F-F, S-H-A-N-N-O-N.

Thanks, very much.

So that's J-E-F-F, S-H-A-N-N-O-N.

I am in a very serious impact zone with my home which rests on the corner of 204th and 52nd Avenue West here, right across the street from the WorkSource building.

I-221-001

One thing I'd like to make -- a comment I'd like to make, which is probably already a moot point, is that while it's really gratifying to see the attendance here tonight, I hardly think 5:30 is an optimum time for maximum attendance for meetings like this. So you might want to modify that in the future.

I-221-002

And I don't wish to sound cynical or paranoid about this, but I've already noticed that several of the viewpoint visualizations that are shown on the slides out there are showing lots of trees around these tracks when the tracks are supposed to be -- trees are not supposed to be anywhere within 30 feet of the tracks. So a lot of these pictures are already misleading. So we need to make sure that we have honesty and integrity in visualizing these future photos.

I-221-003

And my third comment would be that -- and I'm sorry if this sounds very cynical, but it seems to me that

I-221-001

The public meetings that were held during the public comment period for the Draft EIS occurred between 5:30 p.m. and 8:00 p.m. The proposed time was selected to generate the greatest attendance because it coincides with a large population of commuters on their way home from work. Having the meeting held through 8:00 p.m. allows for attendance from individuals outside the targeted commuter group. In addition to the public open house/public hearing, there were other opportunities to comment including sending written comments and emails directly to Sound Transit. The Draft EIS was made available to review on Sound Transit's website, at multiple public libraries and Sound Transit offices, and were available for purchase. Chapter 6 of the Final EIS includes additional details about the project's public involvement and agency coordination plan.

I-221-002

Photo simulations of the alternatives are consistent with the tree clearance policies of Sound Transit for operation of the light rail system. In general, vegetation is cleared 30 feet from the centerline of elevated structures, which is about 15 feet from the edge of the structure. For at-grade sections, branches and drip line are maintained to be at least 10 feet from the overhead catenary system (the wires that provide power).

I-221-003

Thank you for your comments.

I-221-003

somebody being on the board of Sound Transit and a city council member, strikes me as something of a potential conflict of interest.

Thank you.

My address is 20406-52nd Avenue West, which is ground zero for C2.

MR. ROBERTS: Thank you.

Okay. Next, we have Linda Willemarck or Willemarck. I'm sure I'm not doing that quite right, but, Linda, you can correct me.

///

///

///

///

MR. SHEIN: Good evening. I'm Gleb Shein, S-H-E-I-N. I am from Lynnwood, 4820-200th Street Southwest. And I would like to welcome everyone here, including Sound Transit.

First and foremost, I'm glad that Sound Transit is finally going to build a viable alternative to daily stop-and-go commuting in the form of light rail. Okay? It should have been built yesterday. However, this incredibly sophisticated project unnecessarily intrudes into our public parks, churches, neighborhoods, businesses, and high-density residential communities.

I-222-001

There are different alternatives proposed within Lynnwood, the C1, C2, and C3 alternatives. Please consider these statements and choose to build on the route described as the C3 alternative. Okay?

According to the DEIS, the draft environmental impact statement, the C3 alternative is the least expensive of the three, the least intrusive, the one that affects the least amount of public parks and private businesses, and the only one that does not displace any families.

On Page 27 of your environmental impacts and mitigation, or EIM document, the C3 alternative would end up in the Lynnwood city center core zone, an area envisioned to include a dense mix of commercial, residential, office, and retail space.

I-222-001

Thank you for your comment stating your preference for Alternative C3 and the reasons why.

I-222-002

The C1 alternative accomplishes the complete opposite. It destroys high-density commercial, residential, and retail space. Why do you need to unnecessarily demolish something that you envisioned just to rebuild it many years later and at who knows what higher costs? Okay?

Both the C1 and the C2 alternatives also unnecessarily run in the middle of our neighborhoods, in the middle of a residential street, in the middle of a protected park -- okay? -- the Scriber Creek Park. This park includes wildlife habitat, protected forest wetlands. The C1 and C2 alternatives would take out a large portion of this park. Yet on Page 28 of the EIM, you write that the conversion of this land to transportation use would not alter the overall pattern of land use or character in this area.

How so? I ask. 40- to 60-foot pillars in the middle of wetlands, in my opinion, dramatically alter the overall pattern of land use, and not just any -- of any park, but anywhere. Okay?

Finally -- I have ten seconds?

I-222-003

In the entire project, the entire length of light rail from Seattle to Lynnwood, only the C1 would go through what's called the Level 5 hazardous materials site. If you're right, you would need long-term monitoring. C3 does not go through a Level 5 hazardous materials site.

Thank you very much for your time and

I-222-002

Your comments stating your opposition to Alternatives C1 and C2, based on your concerns for the negative impacts of these alternatives on residential and commercial land uses, neighborhood cohesion, parklands, wildlife habitat, and wetlands are noted. The EIS analysis of land use is based on the overall effect of the project on land use plans and land use patterns in the city. More localized concerns about changes to neighborhoods are covered in Section 4.4. The assessment of the visual impacts of the elevated rail guideway through the park is discussed in Section 4.5, as well as in Sections 4.17 and 4.18. Table 4.5-1 identifies visual impacts at various viewpoints along the project corridor by alternative. In this table, the assessment of visual impacts is designated as "High" (not "Low" or "Medium") for Alternatives C1 and C2 as they travel through Scriber Creek Park. The analysis of visual impacts presented in the EIS is in agreement with your own assessment of these impacts.

I-222-003

Your preference for Alternative C3 is noted. You are correct that Alternative C1 would pass through a hazardous materials site that Sound Transit has ranked as high priority, and which is currently undergoing long-term monitoring. You are also correct that Alternative C3 does not pass through a hazardous materials site that has been ranked as high priority. See Section 4.1.2 of the Final EIS for further details.

everyone who attended.

MR. ROBERTS: Thank you.

Next, we have Mike Mayes.

MR. SREIBERS: Hello. My name is Gunars Sreibers. That's G-U-N-A-R-S, S-R-E-I-B-E-R-S. And I'm representing the Latvian Lutheran church and community center located just north of Northgate.

I-223-001 And I realize that we're a long ways at the other end of the line here, but just as your community here in Lynnwood's expressing your concerns about this project, we also want to get our information out in terms of the impacts on our community center and make the community and everybody involved in this project aware of just exactly what impacts are going to occur to the Baltic community as a result of this.

We were extremely disappointed in the draft EIS's lack of recognition for the social and cultural contributions of our Baltic community that our center provides both Seattle and the Pacific Northwest. As was mentioned before, we are the hub of the Baltic community here in the Pacific Northwest. The draft EIS really failed to address, you know, the long-term impacts -- short-term construction impacts and long-term impacts on the facility.

Our facility represents thousands of people that come to use this facility. There are numerous activities, as was mentioned before. This is not just a church. This is really a community center for the entire Pacific Northwest extending to Alaska and all the way down to

I-223-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. The impacts to the church were identified in several sections of the Draft EIS, and this information has been updated in the Final EIS to reflect the design measures taken to avoid displacing the church. Sections 4.1 and 4.4 in the Draft EIS mentioned the church specifically, with 4.4 including both long-term and construction impacts discussions, and this information has been updated and further detailed in the Final EIS. All other sections describe construction impacts and long-term impacts occurring along the corridor.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations. Construction period mitigation is also defined for each environmental topic, and Sound Transit anticipates that the center's activities would be able to continue during construction.

California.

The activities that go on there are church services in three different languages, Latvian, Lithuanian, and Estonian; special events and holidays that are unique to the Baltic countries. There's a Latvian language school that's been in existence at this facility for over 60 years. This is used -- this facility used for national and international dance and choir groups that practice there. It's a center for fraternities from the universities of Latvia, Lithuania, and Estonia -- and sororities -- that meet regularly there. There are numerous senior activities that are also ongoing at this facility.

It also is the election center for the Baltic elections for the elections that happen in Latvia, Lithuania, and Estonia and allows their citizens to vote in the election of their countries.

And the -- and the center really has been a hub for establishing the Baltic Studies Program at the University of Washington and continues to fund that program.

I-223-002 If the center is disrupted, it is unacceptable to the Baltic community. Any option that comes close or moves the center will be devastating and, in all likelihood, lead to the demise of the many of the activities that currently happen there. In reality, it will end the Baltic community's presence in the Northwest and the cultural

I-223-002

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-223-002

richness it really brings to this community. The center must -- and I emphasize -- must continue to function at its current location.

One last note that I think is particularly noteworthy, we have been through this process once before. Our center was actually located in -- further to the west and in -- was actually -- we purchased it in 1955. In 1969 the center was actually taken by eminent domain, a process very similar to this. We were forced to move. And through the outpouring -- the generosity of donors and volunteer labor, we were able to transform that center into its present location right now.

It is really inconceivable to us that we would be placed in this situation for the second time, that we would have to move by eminent domain.

Thank you.

MR. ROBERTS: Thank you.

Next, we have Eric Goodman.

///

///

///

///

8/21/2013

MR. WALKER: I am James Walker. And I'm at 20308-52nd Avenue West. And it's W-A-L-K-E-R.

I'd like to comment on the impact to the Lynnwood park-and-ride lot. Right now we have a facility that functions very well for buses as well as car pools and van pools. You see them going through all the time.

I-224-001

My concern is that with addition of light rail, we won't have enough parking. The park-and-ride lot is over capacity and, as far as I know, has been from the day it opened. And so I am hoping you will expanding the parking for the light rail as well as for more carpools, vanpools, and transit users.

I-224-002

I don't want to see light rail come in and steal from other modes that are alternatives to single-use vehicles. We don't want to trade off those options against each other. We want to get people out of cars and into the city in as many modes as possible.

I-224-003

I'm noting that in Mountlake Terrace, the interchange there is not accessible from the north. And so there's a minimal usage of that by vans and car pools.

If you extend -- if you add a station at 220th, it would be nice, in the southbound direction from the north, if you could widen that ramp. It already backs up most of the day. It's down to maybe 50 miles an hour almost 24/7. If you could extend that up to the Mountlake

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 45

I-224-001

The park-and-ride lots have generally been sized to accommodate a balance between forecasted parking demand and minimizing potential impacts created by the facility. The Final EIS includes additional analysis of more parking at Lynnwood and Mountlake Terrace.

I-224-002

Thank you for your comment on concerns that the proposed light rail service between Northgate and Lynnwood could reduce bus ridership in the area. See Section 3.2.2 for a discussion of transit impacts. Overall, transit ridership, both buses and light rail, would increase through 2035. The light rail service would be faster, more frequent, and operate for longer periods each day than bus service. Following the construction of the Lynnwood Link Extension project, it is expected that the bus transit agencies serving the Northgate to Lynnwood corridor would revise their service plans to both revise routes to serve the new light rail station as well as expand services elsewhere (see Section 3.4 Indirect and Secondary Impacts).

I-224-003

Adding access to and from the north between 236th and I-5 is outside of the scope of this project. Traffic to and from the north would either have to use the Lynnwood Station or 220th Street Station (if built) or use the local street system to access the Mountlake Terrace Station.

I-224-003

Terrace exit, which is 236th, if you could extend it to the north so that people from the north could have access to the Mountlake Terrace station, I think that would help a lot, the big structure right there.

And that's my comment, really.

MR. ROBERTS: Thank you.

Sir?

MS. WALKER: I'm Janice Walker, J-A-N-I-C-E, W-A-L-K-E-R. My address is 26308-52nd Avenue West in Lynnwood 98036.

I-225-001 My house is located -- if the elevated train goes down C1 or C2, we would be looking at footings out our front window. And I would like to see Sound Transit and the City of Lynnwood adhere to the C3 plan that keeps it along I-5.

I-225-002 The reason for that is two-fold. My first reason is because I love my home. I don't want the noise. I worked very hard on this property since 1997 when we purchased it. And I now have a nice home where I can relax and was hoping that I would be able to not have an increased noise level which will be brought by the train and the increased scheduling.

The train would run longer than the bus lines run, and we would have noise in the middle of the night, which I find disruptive. It would be disruptive. And I really don't want to have the peace of my home destroyed. It means a lot to me.

I-225-003 And as a resident of Lynnwood, I feel that the City has not done a very good job at integrating that particular neighborhood into the rest of the city. It's pretty much a portion of the city that has been ignored. And running a train down our street is like a slap in our faces saying that we're not important to the city other than

I-225-001

Your comment stating your preference for the Alternative C3 is noted.

I-225-002

The noise analysis for the Lynnwood Link Extension uses the FTA impact criteria, and Sound Transit would mitigate noise impacts to levels below these criteria. Sound Transit's policy is to mitigate moderate or severe impacts. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts.

I-225-003

Thank you for your concerns about the impacts to neighborhood character and cohesion from Alternatives C1 and C2 in Lynnwood.

I-225-003 to use us as disposable residents for our property.

I-225-004 My second reason is because, since 1997, I have watched the development, ecologically, of Scriber Creek Park. And in that time, in the time that we have lived there, we've done fish watch. And we went from, 10 or 15 years ago, having no fish in Scriber Creek Park in the overflow in the lake and also in that trail area, wetland between 52nd and the park-and-ride, there were no fish there. There was not a lot of wildlife.

And in that time, there are now fish. There are at least two varieties that I saw listed in this public meeting. We have also seen an increase in heron population. We have seen an increase in the types of ducks and birds that live in our -- in our ecosystem there. I've seen wood ducks. I have seen bald eagles flying over my house. And I have also seen shoveler ducks.

And I don't want to see that destroyed by having Sound Transit and the City see fit to have a train go right through the wetland or the edge of the wetlands where it's a sensitive area. I feel that by keeping the train along I-5 that the transit system could be better served and the ecosystem could be better served.

I do understand that there is a certain area of sensitivity along I-5, but I feel that by using -- by using this, they would be able to mitigate some of the impact in

I-225-004

Sound Transit's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation is to avoid impacts to environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure there is no net loss of ecosystem function and acreage as a result of agency projects. Section 4.8 discusses impacts, including mitigation in Section 4.8.6.

I-225-004 other areas by keeping it along I-5 and not down 52nd.

That's all.

///

///

///

///

///

8/21/2013

MS. WALSH: My name is Maryellen Walsh. I live at Cedar Creek Condominiums. And I've lived there for 24 years and have become extremely fond of Scriber Creek Park.

I-226-001 And I do have some legal background. I'm not a lawyer. But one of things that I checked into early on was the 4(f) regulation. And Scriber Creek Park is protected under 4(f). It is the only route in the three C alternatives that has 4(f) protection. And in order to cut through that park, you going to have to get a de minimus letter from the Federal Transit Authority.

I-226-002 And it seems, with everything that has been said about the C1 an C2 alternatives, the impact on the community, the neighborhood -- the people across the street from us, Oxford Square, are just appalled that they're going to have look at this steel -- or cement contraption. And they're talking about crime in their neighborhood as it is, and this will just increase the crime.

I-226-003 Further, the graffiti that will go on the posts in the park is -- it will just completely alter the park experience. And having an electric train rumbling over your head while you trying to listen to birds and appreciate the wildlife and the beauty of having this great oasis in the middle of the city will be completely ruined.

I say go with C3. Thank you.

MR. ROBERTS: Thank you.

Seattle Deposition Reporters, LLC www.seadep.com * (206) 622-6661 * (800) 657-1110 Page: 41

I-226-001

You are correct that Alternative C1 would be subject to a Section 4(f) use determination. The Final EIS Section 4.18 notes that FTA has determined a Section 4(f) use would occur, as a de minimis determination was not available because the City of Lynnwood was not able to concur.

I-226-002

Thank you for your concerns about the impacts to neighborhood character and cohesion from Alternatives C1 and C2 in Lynnwood. Section 4.5.4 compares the visual impacts of the three alternatives, and Section 4.14.2 discusses changes in neighborhood crime rates associated with the guideway and transit station areas.

I-226-003

Thank you for your comment stating your preference for the C3 alternative and the reasons why.

MR. WHITTALL: Corey Whittall, C-O-R-E-Y, W-H-I-T-T-A-L-L. I live at 20505-53rd Avenue West.

I-227-001 My one concern here is the tree line that we have. And one thing -- yeah, we all voted for this to come into Lynnwood. Appreciate that, but we've also voted for and paid for the school district to put their administration building on that lot where the school was taken down, Cedar Valley Elementary. And no one's been able to answer the impact that the structure would have on -- C1 and C2 -- to the entrance of administration building.

I-227-002 They already did speak about the noise level being, you know, pushed back and everything if it stays with the C3. Which I appreciate that. But in the pictures that you guys show on your Web sites here, you're all -- most of them are no trees on 52nd. That tree line right there, on 52nd that was the buffer from the school, would all be downed. And I'd be standing in my backyard looking at this train. The train would be over my house, basically. Because I live right by -- right behind the grange hall. So my backyard would be staring right at it.

I-227-003 So going to work every day in construction, dealing with traffic and everything, and then coming home to sit peacefully in my backyard, except for, now, I have a train over my head. It's not going to work for me.

Anyway, I just wanted -- I just wanted people not

I-227-001

Thank you for your comment stating your overall support of the Lynnwood Link Extension project, but your concerns about the anticipated adverse impacts of Alternatives C1 and C2 particularly along 52nd Avenue W. The Preferred Alternative in the Final EIS is a modified version of Alternative C3. Some of the tall trees would be removed on the east side of this street for the elevated guideway. As shown in Figure 4.5-6, the visual impacts from residences on the west side of the street is shown as "High" impact. The visual impacts on the east side of the street are designated as "Low" as the area is zoned light industrial and not residential.

The entrance to the Edmond's school district property would be maintained.

I-227-002

The analysis on Draft EIS page 4-81 concludes that the elevated guideway would visually intrude upon the integrity and unity of this residential area. Figure G-118 shows the typical vegetation that would be retained adjacent to the guideway. The largest grouping of mature trees along 52nd Avenue West is adjacent to the former school site north of Dolores Avenue and these trees would likely be removed to accommodate the elevated guideway.

I-227-003

Thank you for your comments stating your concerns about the potential traffic, noise, and visual impacts of the project along 52nd Avenue W. during project construction and future operation.

to forget about the administration building for school district as well, which we all paid for.

MR. ROBERTS: Thank you.

///

///

///

///

///

///

///

///

///

///

///

///

///

MS. WILLEMARCK: Yes. Linda, L-I-N-D-A; last name is Willemarck, W-I-L-L-E-M-A-R-C-K. And I live in the Lynnwood area. I'm also one of the 77 acquired and removed properties if they choose C1. I-228-001

We did bring photos tonight -- we put them out in the lobby -- of both the home, the condo area that we live in. We're 90 percent occupied there. People have lived there for decades. The condos were built 35 years ago. So the huge pictures of trees are real in those photographs out there and for the park.

I wanted to refer to -- in your reader's guide to the DEIS, on Page 2, it says, And EIS proposes action that will help mitigate unavoidable impacts.

I don't see any mitigation needed for C1 because there aren't any unavoidable impacts. They can all be avoided if you simply go down to C3.

The other thing I wanted to say is that we're a thriving community right now. There are 31 businesses up and running right now, employing people from physical therapy, Oriental medicine clinic, community clinics, and others who will lose their place of business. And I believe, as Gleb said earlier, tearing down now what you want to build later seems like a whole lot of work when we already have it and it already exists. I-228-002

C1 is the most expensive. It does affect the most I-228-003

I-228-001

Your preference for Alternative C3 is noted.

I-228-002

Thank you for your comments about the stability and strength of the Lynnwood community. Following the publication of the Draft EIS, Sound Transit received a substantial number of comments in support of Alternative C3 due the community impacts of Alternatives C1 and C2.

I-228-003

Sound Transit identified a modified Alternative C3, as the Preferred Alternative. Please see the Chapter 2 of the Final EIS for a description of the Preferred Alternative.

I-228-003

people in business by a huge margin compared to C2 and C3. It's not minor differences. It's 77 properties of homeowners to one and nothing. It is 31 businesses compared to three and one. It's a huge difference. I think C3 is the obvious choice.

I-228-004

The other thing I want to bring up is, I saw the other day that Lynnwood is asking Snohomish County for monies from the Conservation Futures grant, which they receive. They're asking for $7 million in order to purchase land to conserve for the future, which I think is a great idea. What confuses me is that the Scriber Creek Park sign -- if you go to the park and read the sign, it says, Funded, in part, by the Conservation Futures grant.

So here we are asking for $7 million to buy property on this hand; and on this hand, we are considering giving up property purchased by those same funds in 1991 to give to Sound Transit to build on. And I have a real problem trying to digest that.

That's -- oh, my address I'm 4900-200th Street.

MR. ROBERTS: Thank you.

Next is Mary Monahan.

///

///

///

///

I-228-004

Your comment is correct that Conservation Futures Funds were used as part of the funding to acquire property for the park. If the alternative selected for the project requires use of Scriber Creek Park property, Conservation Futures funding requires approval of the transfer by the original funding jurisdiction, as well as mitigation for impacts. The Preferred Alternative avoids this concern.

I-229-001

MR. WILLIAMSON: I may wonder about one thing. On the C3, is that station going to be between 44th and 46th Street because -- well, I mean, 44th and 46th Street? Because 46th raises up and is a car pool set of lanes.

MR. ROBERTS: You know, and I'm going to ask, if you don't mind -- because that's good question. I don't have the answer to that. And we're not going to have a -- we don't have a dialogue in this process. But we certainly do have people to answer those questions. So if you wouldn't mind, I think we'll have staff try to give you an answer to that. And that's a great segue to --

MR. WILLIAMSON: Because that's what this fellow's going to --

MR. ROBERTS: No, no. And I get that. But I want to be clear. What we're doing here in this part of our program tonight is, I'm not going to enter into a dialogue. I would tell you, I would be the last person to be able to talk in good detail about this, though I have gone through the sites, all of them.

But the staff is here to answer those questions and can do that.

Let me first say thank you for all of you coming tonight, taking your time out of your evening to be here with us and share comments. That is important, and we are in the process of gathering these comments. This is what

I-229-001

Thank you for your comment stating your concerns over siting of the Alternative C3 station and potential traffic impacts on adjacent roadways. For this alternative, the station would be elevated and the track guideway approaching the station would be elevated above 46th Avenue W. Option 1 assumes the existing transit center would remain at its current location. Under Option 2, the bus transit center would be relocated adjacent to the light rail station with a conversion to transit-only vehicular traffic on 46th Avenue W. The Preferred Alternative has a station closer to the transit center and includes street improvements on 200th Street SW and along 44th and 46th Streets (see Appendix F). Chapter 3 describes the operational effects of all of the alternatives.

MR. WILLIAMSON: Well, okay. I could have -- I could have given you a full earful. I'm going to try to write this down later on, on my draft comment form.

I-230-001 But I have concerns about things such as, well, noise issues, particularly on the curve. Of course, that's always a wear-and-tear issue, when it gets down to engineering, better solved by keeping the line straight.

I-230-002 There's wildlife involved were I live. Frogs come into the condo units where I live, kind of in between the place. It's pretty well landscaped and things like that.

I-230-003 And -- and hey, I also live there. It's Cedar Creek Condominiums. And I would be one of the 77-odd people that would be displaced if the C1 alternative were taken. And I think there are at least 33 businesses I've counted along the basic route.

I-230-004 And then there's earthquake damage. I mean, everything is going to have to be dug down and designed to -- to keep the earthquake from causing problems due to liquefaction. I remember the Nisqually earthquake back in 2001, February 28th, comes back, you might say like the old rock-and-roll song, with a shake, rattle, and roll. And the big thing, of course, is not -- the big concern is not the first two, but the third.

And as Kobe, Japan in 1995 proved, you can build your buildings straight up, and it will be well-structurally

I-230-001

It is Sound Transit's Policy to mitigate all noise and vibration impacts, per FTA criteria. Noise and vibration mitigation measures will be included in the project for identified impacts.

Wheel squeal only occurs on tight radius curves, not on a tangent track, like the ones along most segments of the corridor. For areas with tight radius curves, like the curve to 52nd Ave, trackside lubrication will be used to mitigate wheel squeal.

I-230-002

Your concerns about wildlife impacts are noted.

I-230-003

Thank you for your comment stating a preference against Alternative C1. Sound Transit recognizes your concern for the residents and businesses that would be displaced with Alternative C1.

Sound Transit policy provides for a fair and equitable means of addressing real property impacts across its projects, and this includes relocation assistance a manner consistent with state and federal law.

I-230-004

The Draft EIS and Final EIS include a summary of the geologic hazards that have been identified in the project areas. The project design will address identified geologic hazards, and will include earthquake engineering in accordance with applicable building codes addressing factors such as ground shaking, liquefaction, lateral spread, liquefaction-induced settlement, and seismically-induced slope instability. The earthquake engineering building codes incorporate research on hazards from identified faults in the Puget Sound area.

I-230-004

engineered. But if you've got it on muddy ground, you've a problem, liquefaction. And some of these buildings keeled over fell over against one another and shattered the whole ground. There were people that were killed. So that's simply something, as you're building up.

I may have some little things about making sure that this gets into the final draft because I did -- final form because I did not see some of those things addressed in the draft EIS, particularly engineering problems.

I-230-005

And of course, I would probably urge everyone, walk the route and ask the people in the areas on all three routes, how is it going to effect them if one, another, or the third alternative is taken. And of course, when you get down to end of it all, you're still going to have some other businesses beyond 44th that will still be impacted until you get back to the Interurban buffer -- buffer strip.

And generally from that point going, I would say keep the route, if you're facing north, to the left side of the freeway pretty much all the way up as far as you go, Everett, Marysville, et cetera. That would probably do it. And if you keep the curves at a minimum, you'll have far less wear and tear and less noise.

I've been a engineer and I've looked at some of the logging roads that I worked on years ago. Some of them are now washed out because people forgot deferred

I-230-005

Thank you for your comments.

I-230-005 maintenance is the most expensive of all. And when they're not kept up, the damage and the loss could be great.

And I also remember Jesus had two parables. One was about a man who did not count the cost. And when he ran out of money, his pyramid, his project, was only half complete. And everyone came around to ridicule him on the results.

Another one was about the man who built his barn and decided he's going to add more to include his increased harvest. But God came at the night that he was patting himself on the head saying, I'm going live life with ease now.

And God came and said, You fool, don't you know that tonight your life be taken from you, and who will enjoy our acquisitions then?

I-230-006 So I say, count the costs, look ahead, but also look behind you. Because I also remember a boondoggle in Ballard, back in the turn of century. And people got set up on than to too.

MR. ROBERTS: Thanks, Mr. Williamson.

Let me just say, I forgot to mention that the comment -- the extended comment period ends September 23. So there is certainly time to add comments until September 23.

MR. WILLIAMSON: Thank you. Walk the routes so

I-230-006

Thank you for your comment. Costs will be among the factors the Sound Transit Board will consider in selecting the project to be built.

you know what you've got.

MR. ROBERTS: Thank you.

The next person I have signed up is Valdis Riekstins.

To: Lynnwood Link DEIS
Subject: Station selection between 145th and 155th ST

TO: Lauren Swift

I-231-001

We prefer/chose the 145th Station location for the following reasons:
1. The location is more open, will require small habitat removal, and is already at grade for a ground level station platform.
2, 145th St East and West is a major arterial well developed with the potential for major upgrades with an eye to future residential and business development in support of the new station location.
3. WDOT should be able to give right-of-way in larger portions at this location allowing for the addition
of a 650+ vehicle parking facility with transit access by both CT and Metro.
4. The city of Shoreline has already agreed to accept responsibility for both sides of 145th St.
5 145th St has the best development potential for high density residential housing with collateral business development.
6 Perhaps with some vision, a restaurant (glass house concept) over the freeway on the bridge like the
one in Chicago (MacDonalds) would be a corporate contribution to the upscale of that venue.

Ms. Swift,

The attached letter contains my comments and suggested edits on the Draft Environmental Impact Statement for Sound Transit's proposed Lynnwood Light Rail Link. I hope that you will give this letter and its suggestions your full attention and consideration. I welcome the opportunity to talk with the Board about them in further detail.

Sound Transit DEIS Comments
c/o Lauren Swift
401 S. Jackson Street
Seattle, WA 98104

Ms. Swift,

This letter contains my comments on the Draft Environmental Impact Statement (Draft EIS) for Sound Transit's proposed Lynnwood Light Rail Link.

I am a supporter of Sound Transit Light Rail and conceptually I think that the Lynnwood link extension will benefit the region. All of the current designs however, will have significant and negative impacts on my property values, my families' quality of life, and potentially our safety. I have read relevant parts of the Draft EIS and I do not think that the noise, and particularly visual, and safety impacts of the designs have been properly accounted for, especially in my case. I suggest five ways that the Final EIS should be modified and present two minor modifications to the route, either of which should mitigate all of my concerns at little additional cost.

I live in Shoreline's Ballinger neighborhood at **20035 12th Ave NE**. My property borders, and is directly east of, the I-5 northbound off ramp for Exit #177.

I-232-001

Noise Impacts
The Draft EIS suggests that the additional noise from the train will be minimal. I am skeptical about the noise estimates for two reasons:

- The model for estimating noise uses data from microphones that were not placed very close to my property. My house is situated on top of the only hill in the neighborhood; as such, it seems unlikely that the model output accurately represents conditions at my house.
- There are many trees, shrubs and other vegetation that will have to be removed to install the elevated tracks. It is unclear if this reduction of sound-absorbing vegetation was considered when modeling the increase in noise.

1) In the Final EIS, I would like to see the estimates for noise impacts at my property revised to account for and address these concerns.

I-232-002

Visual Impacts
The Draft EIS identifies the visual impact for my address as "Low". By any definition, this is clearly incorrect.

- All current designs have the track, less than 90 feet from my property and elevated 25 feet from the ground (or approximately 15 feet above the I-5 off ramp). Adding the train height of 12 feet and additional superstructure suggests a combined sight impact nearly 40 feet tall.
- My current view towards the off ramp is of 125 feet of light-filtering (and noise dampening) evergreens. Replacing this natural view (a primary reason we bought the property and the defining characteristic of the neighborhood) with a three story tall structure not a "low" visual impact.
- I have attached my artists renderings (Figures. 1a-c) of what our backyard will look like after the elevated track is built as designed in the Draft EIS. Again, clearly not a "low" visual impact.

2) In the Final EIS, I would like to see a re-evaluation of the visual impact on my property revised to account for and address these concerns.

1

I-232-001

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Sound Transit's policy is to mitigate moderate or severe impacts under FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Foliage, if dense, can provide slight reductions in noise levels. The FTA and FHWA provides for up to a 3 dBA reduction in transportation noise for locations with at least 100 feet of dense foliage that contains leaves year around. Because of the varying foliage in the project area, the estimates of noise used for the EIS assessment did not assume foliage would reduce the noise from the train, and the resulting projections of noise and the mitigation measures are conservative. A 3 dB reduction in noise level is barely perceptible to most people, so foliage in virtually all areas of this project corridor will have little overall effect on light rail nor traffic noise.

Topographical conditions are included in the noise analysis, which used models to project noise based on the location of the train and the location of sensitive receptors. The Noise and Vibration Technical Report has further details on the existing and project future noise levels for specific homes in the study area, including your property.

I-232-002

The Final EIS includes an updated assessment of impacts of the elevated structure at this location, however the Draft EIS was not intended to define visual impacts parcel by parcel, but rather for larger areas of viewsheds. It is accurate that some locations, particularly those adjacent to the facility could have higher localized impacts. Sound Transit's tree clearing policies for elevated light rail provide for clearing within 30 feet of the centerline of the structure, or about 15 feet from the edge of the structure. At this location, there is about 115 feet of

I-232-003

Potential hazards and safety concerns

- Three professional arborists have visited my property and all have indicated that removing trees would increase the chance of any remaining trees being felled by wind. In the past 10 years, two very large trees have already come within 20 feet of hitting our house so the removal of any additional trees is a potential hazard and significant safety concern.
- In addition, we have learned that the very steep land just west of my property, upon which the elevated track will be built, is simply landfill deposited while building I-5. As such, risks from landslides are a safety concern given the prospect of significant tree removal.

3) I would like to know how many, and which, trees will remain after construction. I have asked this question of multiple Sound Transit representatives, but no one seems to be able to provide this or any information on what is generally removed in similar situations; yet it is critical to knowing how much our view and potential safety will be impacted.

4) Similarly, I would like to know what assurances Sound Transit can provide that your development plans will not increase the risks (from falling trees, landslides or any other modifications) to my family and property.

I-232-004

My Proposal

I have lived in the Puget Sound area for nearly 20 years and my family has lived at our house for 10 years. We have always had the intention of raising our family and retiring there. However, if the visual and noise impacts and safety concerns are not appropriately mitigated in a way other than what is described in the Draft EIS my family will be forced, very soon, to move in order to retain the equity earned in the house and our quality of life. For perspective, I'd ask if any members of the commission would consider buying a house with these issues, I expect they wouldn't.

I have two proposals for slightly modifying the planned route; either will allow my family to stay in our home:

Proposal 1: Keep the train at ground level where it borders our property and leave all trees intact.

Proposal 2: Have the elevated track cross over the Exit #177 off ramp approximately 300 feet further south, thereby moving it west approximately 40 feet further than currently planned (see attached Figures 2a-b).

5) In the Final EIS, I would like to see an evaluation and due consideration of these two proposals.

Though my comments are written as a response to the Draft EIS I would like to see them addressed in a more formal way perhaps with a direct reply or the opportunity to discuss them directly with the board.

Thank you for your attention to these concerns.

Michael Cameron, Ph. D.
20035 12th Ave NE
Shoreline WA, 98155
(206) 321-7740
michaelfcameron@gmail.com

2

vegetation between the paved area of the shoulder of the off-ramp and the edge of the right of way. There is about 90 feet of heavy evergreen vegetation between the edge of the current vegetation management area for the highway and the edge of the right-of-way. Location of the elevated structure at this location would remove the large evergreen trees closest to the roadway which have the most dense foliage. In most cases, there would be one or two rows of mature evergreen trees retained between the elevated structure and the edge of the right-of-way, however because these trees have grown in shade, the lower branch vegetation is less dense and will provide less of a visual screen. The Final EIS identifies mitigation measures for the project, but the detailed definition of plantings in specific locations would be accomplished during final design. Replacement trees would be considered where space is available. As indicated in Section 4.5.6 of the Draft EIS, new evergreen trees adjacent to the elevated structure would provide screening after a 15 to 20 year period, depending on the size of trees at the time of planting.

I-232-003

During preliminary engineering for the Preferred Alternative and to support further estimates on tree removal, Sound Transit performed initial assessments of corridor trees, reviewed potential tree removal needs, and considered potential tree hazards. While this document was to support continued design and is not part of the EIS, it has been used to update the consideration of visual impacts and to calculate tree replacement and mitigation needs. It is also available on request from Sound Transit. However, definitions of the specific trees to be removed requires a higher level of detailed design and construction planning than is necessary for an EIS to describe impacts and identify mitigation. It is also important to recognize that the alignment remains entirely within the WSDOT right-of-way, and must balance visual impacts against other safety, transportation and environmental management needs. Sound Transit is committed to building a safe system that does present safety

I-232-004

Figure 1a. View (actual and artists' rendering) of NW corner of property looking west.

or hazard risks to adjacent properties. For example, additional geotechnical studies have been performed as part of continued engineering for the project, and structural and other related engineering design assessments reflect the needs for retaining walls, deep foundations or pilings, and other design measures to address areas of geological concern. The Final EIS include a summary of the geologic hazards that have been identified in the project areas. During final design, the project will confirm the design approach to address specific geologic hazards, areas with slope stability concerns along the project alignment.

I-232-004

Sound Transit has reviewed your proposals to consider whether they have the potential to avoid potential impacts near your property.
In reviewing Proposal 1, as the light rail profile approaches the property from the south, it is coming out of a cut into the hillside adjacent to I-5. To lower the profile through this area would require cutting even further into the hillside. At about 800 feet south of the property, the existing ground drops about 40 feet. Traveling north the ground continues to drop further as it becomes adjacent to wetlands and State Route 104. Heading north from there, the next major connection point is the elevated Montlake Terrace Transit Station at 236th St. SW. To maintain a light rail profile meeting established design criteria based on safety and efficiency and to minimize negative impacts through this area, an elevated structure maintaining a minimum height over the southern- most State Route 104 exit ramp is needed. The elevation has been refined for the Final EIS, and the visual impact information in this area was updated.
In reviewing Proposal 2, there are a number of design constraints that require maintaining the light rail alignment in the approximate location as shown in the Draft EIS and now in the Final EIS. Based on design guidelines for the use of the I-5 right-of-way between Sound Transit and WSDOT, the light rail project footprint is outside of an approximately 94 foot section reserved for the freeway and potential future improvements.

I-232-004

Figure 1b. View (actual and artists' rendering) from SW corner of property looking west.

The horizontal alignment is also constrained by a more narrow width of existing right-of-way between NE 185th St. to north of NE 195th St. To provide a horizontal design as shown in your Figure 2a-b, while still meeting the project's light rail design standards, would require further encroachment beyond the right-of-way and upon more properties and homes in this area. Therefore, Sound Transit is continuing to propose the Preferred Alternative design rather than your suggested alternative.

COMMENT

Email: t.g.christopher@ieee.org
Name: Terence Christopher
Date sent: Sept 6, 2013 @ 8:05pm

I attended a meeting held at the Latvian Church at Northgate concerning the proposed extension to Lynnwood Transit Centre. The presentation basically said that the design was determined by cost factors, and the placement of the rail line had been decided and the only discussion therefore was mitigating the nuisance.
I felt that this preemption of public opinion was misguided as the important information that you need the utility of the proposed rail line clearly depends on its use by the community.
You seem to be ignoring the needs of community in order to get the line installed.
My reason for this comment is based on the response to my questioning why the line should be on the East side of I5.

I-233-001

The response was that a bridge across I5 would be too expensive. However at Northgate there is in fact a little used bridge starting at to the East of the entrance to I5 Northbound which has no ongoing highway connections on the West side and merely serves the local community that exists between Northwest Hospital and I5. As a road bridge its structure is more than adequate to carry rail traffic. It is obvious that I5 must be crossed by the rail line if it is to go to the Lynnwood Transit Centre which is on the West side. It might well be that modifying the existing bridge at Northgate might be a lot less expensive than any other crossing point. Clearly a cost comparison would be needed.
Thus the real issue is whether it would be better for the community to have the rail line on the West or the East side of I5.
There are real issues with the difficulties of building on the East side of the expressway as most of the big flyover and road approaches to I5 are located on the East side of the Highway. The land to the West side is elevated above the expressway and the likelihood of need for noise abatement would be much less.
However from my viewpoint as a rider on express buses on I5, there are several big questions and opportunities on the West side of I5.
1) The bus stop at 145th is completely undeveloped. There is a big ramp up to nothing. No parking lot, no connections. I don't see people getting on or off. Yet this is a cross street that goes all the way across the city providing connections from Highway 99 (and the express buses on it?) to Lake city way and that network. It is totally unexploited.
2) Just north of 145 on the west side is a sports field which is used heavily for soccer coaching. It has no public access and parents have to park on the side of the road. It is a stones throw from I5 There is a similar bigger field on the East side
that is too far away to be connected to the train. It would make a great deal of sense to work out a way to combine all of these features into a service that would connect this whole area of North Seattle to the Airport.
2) Just North of 145h on the West side is the Bus Barn.That is used presumably for parking and repairing buses. However it is in residential real estate not commercial real estate. Why not develop that into a North Seattle bus hub connected to the transit? I realise that you have developed Northgate for this purpose , however the traffic at Northgate is really heavy and the mixture with the buses ends up in a quagmire. If you are interested

1

I-233-001

The west side alignments like the one being suggested are not being further considered, as was stated in the Draft EIS in Chapter 2, Section 2.5. West side alignments would have greater impacts without mobility benefits and do not coincide with optimal station locations that the east side alignments through Mountlake Terrace would offer.

I-233-001

I-233-002

in rapidly moving people some connections away from a shopping centre might be a lot faster cheaper and easier. Lynnwood does quite well in that regard as it is out of the traffic patterns.
3) One big point made by your spokesperson was the importance of connecting the rail line to the transit center at Mountlake Terrace. He implied that it was an important centre. However the reality of this is that it is located in a knot of roads and serves only the local area population. The garage and parking area fills up by 8.30 in the morning much as does the transit centre in Lynnwood. Thus the new garage that was completed only a few years ago needs to be increased in size. The whole thing is perched on the side of a hill and I5 closely adjoins it. I am afraid that putting a train track and station there would make further expansion difficult and expensive. However a point that you seem to have neglected is the fact that there is a newly constructed island between the northbound and southbound express ways which is connected by a bridge to the Parking garage. It would only be necessary to build a similar light pedestrian bridge across the southbound expressway to reach a rail station on the west side of the highway which would give access to all of the bus connections without interfering with any future development of the Mountlake Terrace park and ride. With some clever development work it might also be possible to build a parking lot that would connect with 220th which crosses the expressway and would extend the parking for both the rail and bus lines without much expense it would also permit an effective connection to Edmonds avoiding the traffic congestion of Lynnwood.
Clearly I am not a civil engineer, and the cost of building on the west side of I5 needs to be assessed. However I think the opportunities for community service are much higher and the possibility of community damage are much less if you are serious about your your statements that you want to serve the communities that adjoin the proposed rail line.
sincerely
Terence Christopher

2

I-233-002

Your suggestion for an expanded station area with a potential crossing to the west has been considered, as has a potential increase in parking supply. An additional option for a new structure for parking is now considered as part of Alternative B1. Other configurations involving station development in the residential areas west of I-5 have not been advanced because they would be less accessible than the existing transit center, they would be less compatible with City of Mountlake Terrace plans, and they would have higher levels of impacts to the residential areas without increasing mobility benefits.

To: Lynnwood Link DEIS
Subject: Route Alignments

I-234-001

As a neighbor and user of Lynnwood transit Center, I feel option C3 would be most efficient.

People using the LTC commute to other communities. The shortest, most direct route is a straight line.

I-234-002

Please keep the route as far away from our homes as possible to keep noise down. We need noise reduction walls along the freeway as other areas have.

Thank You

Rebecca Farrand
20029 54th Ave W
Lynnwood 98036

1

I-234-001

Thank you for your comment stating your preference for Alternative C3.

I-234-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below this criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Sound walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. In addition, any existing WSDOT noise walls removed as part of the project, will be replaced.

To: Lynnwood Link DEIS
Subject: Sound Transit Lynnwood Link

To whom it may concern;

I-236-001

I am very disappointed with your C1 & C2 proposals for the Sound Transit line coming to Lynnwood. C3 would be the least disruptive for residents, business, traffic & the wetlands. My question is why do you want to hurt so many people? Do you feel we are not as worthy as people in other parts of the region? And no Bus Barn in the neighborhood. We don't need the noise during the quite hours of the day. I have lived in my house for over 36 years & the things that has happened to us in this area is very sad. At one of your meeting one of your representatives said if you go with plan C3, people will have to walk farther. Well look at the set up now in the park & ride lot. People have a long ways to walk to the bus stations when they park at the south end of the parking lot. The government keeps telling us we are obese & need more exercise, so why don't you abide with them & do the C3 plan? People can get an umbrella & leave 5 minutes earlier. I know how something like this truly hurts people that are uprooted. When I was a kid my parents had a house & property in Shoreline they loved but it was in the path of I-5. It took a long time for people to get over this bully effect. Think of the people side; how would you like it if you were in the path of Sound Transit & had to relocate your family or business? The City of Lynnwood needs to be on the side of their residents.

Sincerely,
Judy Lehman

1

I-236-001

Your opposition to Alternatives C1 and C2 is noted, and Sound Transit recognizes your Preference for Alternative C3. The Sound Transit Board identified a modified Alternative C3 for the Preferred Alternative.

Subject: Submitting Comments on Draft EIS on Light Rail Alternatives

To Whom This May Concern:

I-237-001

Thank you for allowing me to submit comments on the draft EIS of the proposed Lynnwood Light Rail station and alternatives. After reviewing the three alternatives, C1, C2, and C3, I vote and support alternative C3, I-5 to Lynnwod Park and Ride Station.

This alternative, C3, has the least impact to the environment, and allows for future light rail extension north to the Alderwood Mall, Everett, Marysville, and the Tulalip Casino, by staying close to the I-5 corridor to provide minimal impact to surrounding commercial, residential, and industrial neighborhoods.

Any new mass transit corridor should take advantage of existing freeways to allow for interaction with existing bus stations, park and rides, and vehicle access. It should also consider future light rail extensions north. All three alternative impact existing property owners, but C3 has the least impact, especially to existing wetlands and parks.

I've been parking at the Lynnwood Transit Center Mon-Fri to take the bus downtown and back for the last 15 years. I have 15 more years before I retire and would like to take advantage of Light Rail to avoid delays due to traffic jams on the freeways.

Please start building the Lynnwood Light Rail Extension soon!

--
Thank you,

Dennis Sismaet

I-238-001

#1 - Why is it taking until 2023 to get to Lynnwood? It will be OUT OF DATE by then.
#2 - Why can the canadians build a sky train in 2 years and you are taking forever?
#3 - Why do we have so many different transit systems in the Puget Sound area when one would be more beneficial to the commuters and cheaper than paying multiple ceo's and upper management?
#4 - When I was a child I recall when the big surge was "Rails to Rubber" meaning goodbye to street cars and hello to buses now you are taking BACKWARD to rails again.....Stupid idea.

1

I-238-001

The project is planned to serve the region's long-term needs through 2035 and beyond. As shown in Figure 2-12, there are many steps required to take a project from initial development of alternatives through the begining of operation. The alternatives analysis was conducted in 2010 through the middle of 2011. Please see Section 2.9.1 Next Steps.

The proposed Lynnwood Link Extension project and the Vancouver, British Columbia SkyTrain are not similar projects. The SkyTrain is a fully automated, fully elevated, intermediate rail system - not a light rail system.

The structure of the region's transit systems reflects legislatively-determined authorities, and is not the subject of this EIS.

I-239-001

I appreciate that the three alternatives for the Link Light Rail Station and tracks at Lynnwood are south of 200th St. SW, and in and around the Lynnwood Transit Center (LTC). I live in Cambridge Apartments, on the north side of 200th St. SW. I do not want to lose my home at Cambridge Apartments, along with 1,000 or so other people who live here, because of eminent domain. Please keep the station and tracks SOUTH of 200th St. SW, even if the station is directly across the street from Cambridge Apartments. I anticipate I will still live in Cambridge Apartments, a good chance, anyway, in 2023. There is an excellent chance I will still be working for the same employer in 2023, and I will still take the bus and/or light rail to from LTC to get to downtown Seattle.

Thank you and God bless! David

1

I-239-001

Thank you for your comment concerning the routes of the Segment C alternatives as they approach the Lynnwood Transit Center. All of the Segment C alternative alignments that are evaluated in the Final EIS remain south of 200th Street SW.

TO WHOM IT MAY CONCERN;

I-240-001 | PLEASE SELECT OPTION C-1 FOR THE LINK LIGHT RAIL. I BELIEVE THIS WOULD BE THE BEST SELECTION FOR LYNNWOOD.

THANK YOU,

Steven E. Bates

Subject: Lynnwood Link Light Rail

Thank you for the opportunity to comment.

I'm excited about the plan to extend Light Rail through Mountlake Terrace and Lynnwood. I live in Mountlake Terrace just behind the Edmonds School District property in Melody Hill.

I-243-001

I admit that I'm conflicted about having a Station at this location. My primary concern is with the families that live in this neighborhood and the potential increase to traffic as it relates to the 220th St SW Station. On the other hand, I would really like having the ability to walk to a Light Rail Station and the commuter opportunities I would get.

As I haven't found this information I have to assume that traffic to the 220th St SW Station would egress by way of 64th Ave W. The drive South on 64th Ave W from the 220th St SW intersection is terribly congested and can be quite dangerous. There are a few Edmonds School District buses that use this intersection as well.

In my opinion significant work would need to be completed at this intersection (especially in a Southerly direction into Melody Hill) to improve conditions. In addition, since I travel North on I5 on my commute back home I turn South off of 220th St SW. I would anticipate that traffic from the East approaching the 64th Ave W intersection has the potential to create significant difficulties.

I would have to say that unless these concerns are addressed (and solved) I would prefer there not to be a 220th St SW Station. I can take Community Transit to the Lynnwood Transit Center to catch Light Rail.

I-243-001

Thank you for your comment about traffic concerns on 220th Street. Traffic to the station would egress at a new signalized intersection on 220th St SW between 64th Avenue and I-5. The new intersection would be designed to accommodate additional station traffic.

TO WHOM IT MAY CONCERN;

Based on the Draft EIS Round & Station Alternatives C1, C2, C3-OPT1 & C3-OPT2, what is the impact for each alternative relative to the following questions:

1. What impact would there be relative to north & south automobile traffic from 44th Ave W & 188th ST SW to 20610 44th Ave W (Embassy Suites Lynnwood North)?

2. What impact would there be relative to east / west traffic from 188th ST SW, 196th ST SW, 194th ST SW & 200th ST SW from 40th Ave W to 52nd Ave W?

3. What impact would there be for access to south bound I-5 from 44th Ave W & 36th Ave W?

4. What impact would there be for access to north bound I-5 from Popular Way?

Please provide responses for questions 1 – 4 addressing their impact relative to C1, C2, C3-OPT1 & C3-OPT2

I-245-001

Chapter 3 of the Final EIS details the performance of more than 20 intersections that Sound Transit and the City of Lynnwood identified for detailed analysis. The assessments were based on predictions of future traffic with and without the project, particularly in the areas where existing or future conditions already created traffic problems in the No Build condition, and where station area traffic would result in an increase. For the Preferred Alternative, Sound Transit identified improvements to mitigate congestion on 200th Street SW, including 44th Ave W. Traffic along 52nd or 188th Street SW is not expected to markedly change due to the project.

From:
Marita Graube
2336 N 58th St
Seattle WA 98103

To Whom It May Concern:

I am writing to express my objection to the light rail extension, as it directly affects the Latvian's community church and cultural center on 117th and 3rd.

I am a first generation Latvian. My father was born in Latvia, but as a young child he fled with his family to escape the horrors of World War II. After five years in a displaced persons camp in Germany, they had the opportunity to come to the United States and rebuild their lives. They always thought that they could go back once Latvia was "free," but freedom from the USSR didn't happen until 1991. As such, Latvians established roots in many regions around the world.

As a local member of the Seattle Latvian community, I enjoy all of the cultural activities for Latvians and our Baltic neighbors. The center is the only local gathering spot for many of the activities I enjoy, such as the annual Baltic Studies Harvest festival, the Community Rummage Sale, and Holiday Bazaar. I also plan to bring my daughter to the Saturday Latvian School when she is old enough to attend.

I-246-001 When I heard that the light rail could entirely displace the Center, I was shocked. The Center has already been moved once for eminent domain. If the plan is to move the Center again, I find this to be entirely unacceptable. We need to find a solution to keep the Center accessible in its current location so it can continue to be a valuable asset to the Latvian community.

Please confirm receipt of this email.

Best Regards,
Marita Graube

1

I-246-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

I-247-001

Comments I own property at 338 N.E 120th Seattle, 98125 in Section A. my choice is A-1 at grade with stations at 145th & 185th I prefer the at grade configuration for it will help keep the noise level from increasing, it lies in the mid 60's now, & maintain privacy for the bordering homes. The at grade configuration would prevent a negative visual impact for our bordering properties seeing an elevated train passing various homes. Neighborhood views from the train are still visable even though being I oppose having a station at 130th 130th NE & 9ES Due to a busy intersection & not a pedestrian friendly area. Handicap ramps at corners & painted crosswalks have been added but heavy traffic & many cars turning at all the corners still make seeing pedestrians difficult. This is not an area that many pedestrians use. 130th is a major street that connects Aurora ave, Lake City, Lake City way & Sand Point loop important distinations. Traffic comes along 5th ave from northgate & points North. We have at the intersection a I-5 north bound exit & on 130th west of the intersection a entrance to South bound I-5. The exit from north bound I-5 causes extensive cross traffic.

I-247-002

I-247-003

In regards to Segment C I feel the best selection would be C-3. We are losing so much natural areas & parks trees & fauna we should make an effort to preserve these areas. Light rail is taking many homes & impacting neighborhoods, what a rare opportunity to preserve or a beloved part of a neighborhood we should do so. We should preserve our neighborhood - what not to the confines industrial areas but where we live!

SOUNDTRANSIT RIDE THE WAVE

I-247-001

Thank you for your comment stating your preference for the Alternative A1 due to minimal impacts to your nearby property.

I-247-002

Thank you for your comment stating your reasons why you do not support a light rail station at NE 130th Street. Sound Transit recognizes that traffic is busy in the neighborhood and it is not pedestrian-friendly. Improvements at each of the proposed light rail stations would include connections with local streets, bicycle paths, and pedestrian sidewalks. Existing handicapped ramps on nearby sidewalks would be reconstructed if impacted by station construction activities. Please see Section 3.2 for a detailed discussion of long-term impacts and Section 3.6 for an outline of potential mitigation measures for all modes of transportation.

I-247-003

Thank you for your comment stating your preference for Alternative C3 and the reasons why.

NO! NO! NO! We do not want this to be the end of the line for the Latvian Community Center.

This Lutheran Church and Community Center is the heart of Latvians in Seattle and its surrounding areas including Canada. The Lithuanian and Estonia communities also use this complex and have no other place to gather.

My husband and I travel two hours from Whidbey Island to attend many of the events held there and would feel a great loss if it were closed or moved. The center is a spiritual, social, and educational stronghold.

The Baltic culture is fragile due to the 50 year Soviet occupation that included massacres and displacements of Baltic people. The center has been and continues to be an essential factor in healing these families.

I-248-001 Please, please do not let this Latvian Community Center be displaced!

Liga Jefferds

Subject: Please don't tear down the Latvian hall in Seattle

I-253-001

I live in LA but grew up near SF and the Latvian halls in both cities were foundational in my life and learning the culture that my parents were moved from. These centers are an integral part of restoring and maintaining cultural understanding for all of the Latvian Americans that use them for church services, school, cultural events, the list goes on and on. To take down something so vital to our sustenance as a culture is a travesty and is taking away from a culture that strives to exist in the country that promised it freedom and opportunity. Please reconsider your plans and design to maintain this building and surrounding park.
Thank you,
Andra Maculans

1

I-253-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

To: Lynnwood Link DEIS
Subject: DEIS Comments

Hello,

I-254-001 I wanted to comment on the Lynnwood Link Extension DEIS. Several of the options include a station at NE 130th St. This station would be a vital transfer point for East/West bus service. Please include this station in the preferred alternative.

I-254-002 The Mountlake Terrace Freeway station should be eliminated from consideration. This station is awful. The walking distance to access this station is completely unreasonable.

I-254-003 At Lynnwood station, many of the designs prioritize auto access over a good transfer experience or pedestrian access. Given that the majority of riders will be arriving at this station by bus, it is important that the transfer environment be of high quality. Also, given that Lynnwood is attempting to foster development of a downtown area that is more friendly to transit, the station should be located to maximize the impact on the new downtown and to encourage transit oriented development.

I-254-004 Finally, the line seems to have 500 stall parking garages at every station. This is regardless of context and demand. Please conduct further analysis of what parking is actually needed and look at what trade offs are available. Are there areas where improved pedestrian, bicycling or bus amenities would provide greater patronage than a parking garage? If so, then these alternatives should be considered. Furthermore, are there areas where the parking could be provided further out and customers could use a bus from a parking lot to a train? If it allowed the construction of several surface lots instead of a garage, it could provide an equivalent amount of parking for less money.

Thank you,

Kevin McClain

1

I-254-001
The 130th Station is included as an option to the Preferred Alternative considered in the Final EIS.

I-254-002
Your opposition to a freeway station is noted. The Preferred Alternative in the Final EIS has a transit center station.

I-254-003
Thank you for your comment on the Lynnwood Station design. As you note, this is a major transit facility that includes many transfers from bus to rail as well as car to transit (bus or rail). The Final EIS includes a revised station plan for the Preferred Alternative that balances access for all modes, including improvements for pedestrians and bicyclists.

I-254-004
Station parking, facility sizing, and design is balanced between the demand for parking and the need for good multi-modal connections in order to serve the needs of the region as well as local communities.

To: Lynnwood Link DEIS
Subject: Lynnwood Link Impact to Seattle Latvian Lutheran Church/Center

To whom it may concern,

I am writing this letter to express my concern and discontent regarding the planned light rail extension to Lynnwood, and specifically its impact to the Latvian Center and Church. As a person of non-Latvian heritage my connection to the Latvian community is something I truly value and the community has taken me in as one of their own. This community is one which is very special to me and one which must be protected from any impact by the Sound Transit construction any way possible.

I learned about the Latvian community growing up in the Bellevue, Washington area. One of my best friends who I swam with and played water polo with was Latvian-American. I can recall every August, right when swimming championships were taking place, she would head off to Latvian school to learn another language, dance and to celebrate and embrace her heritage. I always thought that this was fantastic that she had such a wonderful connection to her cultural heritage. In this day and age, a connection to one's past is something that is oftentimes lost amongst all of the other day to day activities, so maintaining that connection is something that I find to be very amazing and inspiring.

Fast forward 20 years. At the same Latvian-American friends 23rd birthday, with a combined group of friends, I meet my fiancé, who coincidentally is Latvian-American as well. As our courtship and eventual engagement progressed, I was introduced to many different Latvian-Americans as well as participated in many different events held at the Latvian Center and Church. These events ranged from attending church services, to attending wedding receptions held at the hall, to attending dance performances and even to meeting the President of Latvia when he came to the center. The Latvian-American community has always accepted me and welcomed me into their community and center and I consider myself as much a part of this community now as anyone else in the community. Our wedding reception will be held at the Latvian Center in June 2014 and we are greatly looking forward to being able to share this amazing facility with our family and friends. I am so lucky to be part of a community with strong values like a hard work ethic, the value of an education, and respecting their cultural heritage. I am a strong supporter of the Latvian-American community and will continue to be one in the future. I have seen firsthand exactly how important the center is to the community, and any negative impacts to the center from the construction of the light rail will not be tolerated.

Finally, I am employed as an elementary school teacher and teach in a school with moderate poverty. This past school year, 10% of the children in my 3rd grade classroom spoke English as a second language. There has been a state standard implemented in Washington State to teach and foster cultural heritage in the classroom. When our principal offered us the opportunity to attend and present our cultural heritage (as educators) at our schools multicultural night, it was with the intention of helping to close the achievement gap within our school. For my cultural heritage, I was really scrambling for what to present on, since I am not that connected with my cultural heritage. I chose to present on my fiancé's Latvian-American heritage. I presented on how his grandparents were forced to flee their native land of Latvian when the Communists invaded their land, and how they were forced to flee to Germany and eventually were taken in as refugees in America. The personal schema and engagement my students showed towards this story was amazing. They could relate to their

teacher and that engagement carried into more difficult subjects such as math, and it also translated into a successful year where my students could relate to me.

I-255-001 I am asking that Sound Transit re-visit their plans for the Lynnwood Light Rail Extension and consider the impacts to the Latvian Church and Center. The impact to the community by the loss of the center would be catastrophic and one with the community would not be able to endure.

Thanks,
Lauren Molnar

I-255-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Comments on Lynnwood Link DEIS

Sound Transit -

I offer the following comments on the Segment A alternatives in the Lynnwood Link DEIS from the perspective of someone who has lived a few blocks east the potential NE 130th station for decades and has ridden Metro route 41 (and the former route 307) to and from downtown over 10,000 times.

I-256-001 I prefer either A5 or A10 because they provide the best light rail access for my neighborhood while having the least impacts of any alternative with a station at 130th St. A10 might have less traffic impacts here than A5 because it includes a station at 145th instead of 155th. However, A10 is likely to cause local parking conflicts because it offers no parking and none is available on the nearby arterials. Leasing of at least some parking from the Nazarene church (similar to A5) should be included if A10 is selected.

I-256-002 All three at-grade alternatives (A5, A10 & A1) would fix an already problematic interchange at the I-5 off-ramp just south of NE 130th, which is particularly difficult for eastbound motorists during peak hours. (It's disappointing that your DEIS provided no simulation of this vista for the at-grade alternatives.) A1 would have the least impact on my neighborhood of any alternative considered but it would also have us either walk or drive a mile to the 145th St station. It's similar in this regard to A3, which would have the least impact of any above-grade alternative.

I-256-003 The construction of a permanent path connecting the north end of 8th NE to the Jackson Park trail would definitely help if A1 or A3 is selected. This blackberry-infested corridor situated above Thornton Creek might also be a suitable site for mitigation of the wildlife impacts that will occur along 5th Av between 130th and 145th under any proposed alternative.

I-256-004 A7 & A11 would be an horrific blight on this residential neighborhood, something akin to an Alaskan Way Viaduct from a visual, aesthetic and noise standpoint. Just take a good look at Figures G-24 and G-29. Please don't select A7 or A11 under any circumstance! This area, which was formerly part of the Haller Lake neighborhood, suffered enough when I-5 was constructed.

Thank you for the opportunity to comment.

1

I-256-001

The preference for a station at 130th Street NE is noted. The Preferred Alternative includes a station at NE 145th Street and has an option for a station at NE 130th Street.

I-256-002

Sound Transit recognizes your preference for the at-grade alternative, because they would improve the interchange; they also would include pedestrian and bicycle improvements along 5th Avenue NE. See Appendix G for Visual Simulations.

I-256-003

The riparian and wetland area associated with North Branch Thornton Creek is a potential site under consideration for compensatory mitigation to offset unavoidable permanent impacts.

I-256-004

Your opposition to Alternative A7 and A11 is noted. The Draft EIS and Final EIS address visual impacts and mitigation in Section 4.5.

Destroying the Latvian Center would be like cutting the heart out of a living organism. And a living organism is what the Latvian Community is. Certainly the organism can survive with an artificial heart, but it's not like having your own natural heart that grew with your body. The Latvian Center was created by the Latvian Community with their own hands, their own thoughts and creativity, their own funds, their deep need to have a place of their own - OUR OWN - to come together - to celebrate, to mourn, to remember our homeland and all that was lost when we had to leave it, to pass our beautiful culture on to our culture, to support each other when we were strangers in a strange land and to support and sustain those who were left behind, but always in our hearts.

Subject: The Latvian Center:

Dear Sound Transit:

I-258-001

Running the train through the Latvian Center is a bad idea. The Center is not simply a one family dwelling. It is a spiritual and cultural center that serves hundreds of families in Seattle and the Pacific North West region. For those of us who live outside of Seattle it is our connection to the Latvian/Baltic community. Here is how I see it:

1. Yes, the voters approved the Northgate to Lynnwood light rail link.
2. No, the voters did not approve the devastation of the Latvian Center.

The devastation of the Latvian Center is a choice made by Sound Transit. There are many options besides the two proposed by Sound Transit. The choice has to be justified and not simply made by fiat. The time honored method to do this is a cost benefit analysis. Did Sound Transit do any type of analysis when you decided to run the train through the Latvian Center?

It is easy to see the benefit to Sound Transit in the way of convenience and perhaps saving a bit of money to be spent elsewhere, but what about the cost to our community?

Sincerely, Maris Plavins

Sound Transit
Draft EIS comments
c/o Lauren Swift

I-259-001

I am commenting on the Lynnwood Link DEIS issued July 26, 2013. I am an active member of the Seattle Latvian Community, whose Center at 11710 3rd Ave NE in the Northgate area of Seattle, is slated to have tremendous impacts with any of the alternatives presented to date. The property would either be acquired in total or lose ingress/egress, as well as the caretaker's house and a significant section of parking and entrance areas.

Although it is inconceivable to me that somehow the importance of the Latvian Community Center & Church had not been noted prior to any of the options currently being presented in the DEIS, it also must be conceded that a light rail transit link to the north of Seattle has some merits. That none of the aforementioned options have managed to avoid dire consequences to the Latvian Community Center is something that the EIS must address and plan to improve.

I have lived in the Seattle area since 1965 and hence have been an active participant on many levels. The first Latvian Center in the Wallingford area of Seattle was acquired by eminent domain in 1969 for the construction of a park. In the interim years of 1969 until 1972 when the presently used Center was opened, I was a teenager and attended Latvian school, danced in the folk dance group 'Trejdeksnitis' and sang in the choir in various rental spaces. Even though that was some years ago, I can

I-259-002

attest to the disruptiveness of not having our routine spaces for use. Any construction phase that would not allow the Latvian community to use their hall and church would again have a similar disruptive effect.

I am currently a congregation and association member, a folk dance ensemble member and a singer in the ensemble 'Sigulda'. I also direct a newly founded dance group scheduled to begin this October, planned for the middle aged dancers who still want to maintain theur culture and physical activity.

I-259-003

I urge the Sound Transit board members, engineers and planning committees to find a solution that allows the Latvian Community to retain is present property and location in a way that maintains its viability. If our community should be forced to relocate yet again, I feel it would be an insurmountable challenge at this point in time.

Thank you for your consideration. I truly hope a reasonable solution can be attained.

Sincerely,

Inese Raisters

I-260-001

Looking at the various options, all have an impact on the Latvian Community Center at 11710-3rd Ave NE. The community center is the center for Latvian, Estonian and Lithuanian functions on daily, weekly, monthly basis.

The EIS does not address how these community functions can continue without interruptions and how the access to the center is provided at all times, including during the construction phase.

As a member of the Latvian community and a regular user of the center, I find the EIS lacking in planning and the approaches proposed not acceptable.

Andris Rogainis 9/9/13

SOUNDTRANSIT
RIDE THE WAVE

I-260-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describing the acquisition impacts; Section 4.4 describing impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Subject: Lynnwood link

I-261-001 Am very concerned about the destruction of all the wet lands involved and people. The choice of c-4 a new choice seems like the best one and the least amount of destruction . It is also the closest to the park and ride making it easy to catch a bus to any where in Lynnwood. The cost would be less also. We will be at the meeting Saturday and have several people to speak for us.

I-261-001

Thank you for your comment regarding your concerns about impacts to both wetlands and displacement of residents. See Chapter 2 for a description of the Preferred Alternative, which is a modification of Alternative C3.

I-262-001

Since 1997, the Latvian Center has played an important role in my life, particularly as the husband of a Latvian woman who is very engaged in activities at and with the Center. Losing such a valuable resource would be a tragic hit to the Seattle area Latvian community, eliminating a very integral component of their culture and lives in general.

I humbly request that you reconsider any plans to remove the Latvian Center and allow those who utilize this fantastic cultural resource to continue doing so. I would also appreciate confirmation that this email was received.

Respectfully,

Marshall L. Schott, Ph.D.

Subject: Re: LLE Segment A Comments

Hello,

I sent in these comments in early August, but never received a reply. I'm resending the email but will recap my key concern here, in regards to building a station and parking at 155th:

I-263-001

- Would the rail station require the loss of the fire station? The fire department provides coverage over a wide section of this part of town, and frequently responds to calls from the retirement center on 1st and 149th across from Twin Ponds park.

I would appreciate a response, and look forward to the final decision. Thank you,

Steve Senter

On Fri, Aug 2, 2013 at 11:13 AM, Steve Senter <steve.shoreline@gmail.com> wrote:
Hello,

Thank you for preparing and providing the DEIS materials on your website. I found them to be comprehensive and detailed without devolving into 'legal-ese' and becoming completely incomprehensible.

I live near the proposed station and changes at 155th, so naturally these options are my focus of interest. I value the intention of extending light rail northward and look forward to using the services (when ready in a decade or so); I currently take buses to and from the Northgate center - downtown during the week.

My primary concern with the proposed station at 155th and I-5 is the potential loss of the Shoreline Fire Department Station 65 on the East side of I-5. I didn't find in the materials (though confess I didn't read every document) whether or not the station would be impacted, but I can only assume so given its proximity to the light rail route. Would the rail station require the loss of the fire station? The fire department provides coverage over a wide section of this part of town, and frequently responds to calls from the retirement center on 1st and 149th across from Twin Ponds park.

I-263-002

My other key concern relates to impacts on local traffic. The section covering this in the materials (section 3.1.4) clearly points out that 155th from Aurora to 15th is already at risk for poorer LOS with or without the proposed rail station, and I wonder what the City of Shoreline plans for the future. I already experience the stated peak AM and PM LOS along Meridian and can only anticipate how this and neighboring roads will be impacted - 1st Ave NE from 155th south in both direction could

1

I-263-001

The NE 155th Street station would not displace the fire station. Sound Transit is aware of concerns about the possible impacts of a station at NE 155th Street on the operations of the Fire Station. In the design and development of a station at that location, and the management of traffic serving the station, Sound Transit would work closely with the Fire Department to resolve any potential conflicts with bus and vehicle traffic to ensure that emergency response times would be maintained both during the construction period and operation of light rail.

I-263-002

If a station at NE 155th Street were part of the project to be built, Sound Transit would mitigate traffic impacts from the station as described in Chapter 3. A modified Alternative A1 is the Preferred Alternative, which does not include a station at the NE 155th Street area.

I-263-002 become impassible given its narrow roadway and no paved shoulders, with car and foot traffic to the park, wildlife crossing and the fire station responses in addition to the projected increase in light rail user congestion.

The task of determining the best location for the rail stations is daunting and I appreciate the care and concern put into the DEIS materials preparation and presentation. Please respond to my concerns, or direct me to the appropriate sections in the online materials.

Subject: Link Light Rail - Potential Conflict with future plans for Lift Station #10, Option C3

Follow Up Flag: Follow up
Flag Status: Flagged

I-265-001

To whom it may concern,
I am a project manager at the City of Lynnwood and have concerns with route C3 as it pertains to our Lift Station that is located in the Lynnwood Transit Center Park and Ride Lot. In the future we may need to upsize the lift station to service the planned City Center. The lift station is currently located next to (and partially under) the Park and Ride "Texas T" offramp. Our concern would be that adding additional infrastructure in the area may preclude us from reconstructing the Lift Station in the future, which will be necessary to support our planned City Center. Routes C1 and C2 (the routes on 52nd/Cedar Valley Road) would probably not have an impact on the station.

Just wanted to make sure that this potential impact is communicated to Sound Transit.

Thanks,

Robert S. Victor, P.E.
Project Manager
City of Lynnwood
425-670-5216
rvictor@ci.lynnwood.wa.us

I-265-001

Thank you for your comment with concerns that Alternative C3 could conflict with the City of Lynnwood's plans for a Lift Station. Sound Transit coordinated with the City to obtain further details on the expansion, which is not likely to physically expand the current site. Alternative C3 would not affect the plans for the Lift Station, nor would the Preferred Alternative.

Dear Mr. Drais,

Attached are the following:

- Comments from Linda Willemarck regarding the DEIS;
- Comments from Maryellen Walsh regarding the DEIS;

I-266-001

Your opposition to Alternatives C1 and C2 has been noted, along with your support for a modified alternative to the south. The Preferred Alternative is based on Alternative C3, and was developed in coordination with the City of Lynnwood. See Chapter 2 for a detailed description. Thank you for providing attachments of other parties' comments, including materials directed to the City of Lynnwood during the City's councils consideration of EIS alternatives. Linda Willemark's comments are recorded separately in comments I-530 and I-228. Comments by Mike Mayes, which included his public testimony at one of the EIS public meetings, are responded to under B-001 and I-217. The other attachments you provided were reviewed by Sound Transit, but they are directed to other parties such as the Environmental Protection Agency.

However, to address one of your primary concerns in the letter to EPA about Alternative C1 and its impacts to Scriber Creek Park and its associated wetlands, the Draft EIS included detailed discussions of the impacts to the park and its wetlands, including in the Summary, in Chapter 5 Evaluation of the Alternatives, and in sections 4.17 and 4.18, the latter section dealing specifically with the Section 4(f) requirements that would need to be met if Alternative C1 were to receive approval by FTA. The Final EIS notes that Alternative C1 has not yet met those conditions. Although the Draft EIS did not mention the source of funding for the park, under Section 4(f), any significant public park is treated as a protected resource, and most parks bond measures have similar conditions requiring in-kind replacement.

- Letters from Mike Mayes and Mike Raskin regarding the impact of C1and C2 on their businesses and the neighborhood; and

- A link to proposed alternative C-4 by the City of Lynnwood.

http://lynnwoodtoday.com/city-council-consider-sound-transits-draft-eis/

In addition, we have a petition with over 1600 signatures and are gathering more as people realize what may happen to the neighborhood. Time is of the essence as Elaine tells me the Field Visit will happen soon so I am sending you what we have put together so far with the exception of the petitions which we will present to transit some time before the September 23 deadline. We are in the process of gathering more letters from business owners.

C-4 was recently proposed by the City and after attending the Council Meeting this evening I am more confused than ever about the City's position.

Thank you for your consideration and I apologize for the format of this submission (new computer) but I'd rather get it to you so you can get a feeling for what we are experiencing.

Maryellen Walsh

Subject: Letters from Mike Raskin and Mike Mayes - Business Owners on Cedar Valley Road

September 7, 2013

Re: Sound Transit – Lynnwood Link Extension

2

Dear Mayor Gough, City Council Members, City Staff and Candidates

I would like to join my neighbor Mike Mayes in expressing my hope that the City of Lynnwood will support Option C-3 or the newly proposed Option C-4 as opposed to Options C-1 or C-2.

I am the owner of a three story office building located on 52nd just south of the Mayes Testing and Engineering Building. My building is leased to the State of Washington and houses a number of agencies that provide valuable services to the Lynnwood and South Snohomish County communities. Many of the roughly 250 people that work in the building live in the Lynnwood area and they, and the many visitors to the building, shop at local Lynnwood businesses during their work week. If Route C-1 or C-2 is chosen it will negatively impact valuable community services both during and after construction as well as have a negative effect on local Lynnwood businesses. These people and their many clients in the community will suffer.

If C-1 or C-2 is selected homes and businesses will be destroyed, parks and pristine wetlands will be damaged, companies and residents will be displaced. The construction alone will take years in which time the entire area will be effected. How can that make sense when other options closer to Interstate Five with lower impacts on residents and business are available. Do the studies provided to the City by Sound Transit include the possible economic loss to Lynnwood's business if tenants move away and businesses are forced to close from options C-1 and C-2. I would hope that you as City leaders consider these ramifications before making your choice.

It appears that the Council has in the past favored option C-1 as opposed to option C-3. Staff reports present that the C-1 alignment "might be" more favorable for the proposed City Center project than the C-3 alignment. If the City Center project happens it will likely be many, many years from now. Locating the Lynnwood Link at locations C-1 or C-2 will cause real harm to the City now. It seems shocking that responsible City leaders could choose to impact a significant number of residents, citizens and businesses now for some potential uncertain gain that "might" occur many years from now. I would hope you would carefully question the planners on the disadvantages of C-3. A case could be made that C-3 will make the City Center buildings more valuable since the elevated rail would provide visibility to the buildings in the City Center blocks effected in the same way as the Monorail does in downtown Seattle. Any potential future harm from C-3 is at

best speculative, C-1 and C-2 on the other hand will cause real harm to the City now.

I am encouraged that you are considering a new option C-4. This option does not damage existing businesses and residences in the way that C-1 and C-2 does and it appears that the alignment might not affect the City Center Block in question. Selecting C-1 or C-2 will hurt Lynwood. A choice of C-3 or C-4 makes sense and is good for the community.

Thank you for the opportunity to provide thoughts on this important decision.

Michael Raskin

Re: Sound Transit - Lynnwood Link Extension

Dear Mayor Gough, City Council Members, City Staff and Candidates,

As you know there are three options for the Lynnwood Link Extension. We are pleased to see that the City of Lynnwood is proposing a fourth "C-4" option. It is our hope that the City of Lynnwood will support the C-3 (or C-4) option.

Mayes Testing Engineers is a professional services company which opened for opened for business in 1984 in a leased space located in Lynnwood. We provide inspection, testing and consulting for construction projects. We have provided these services on projects such as the Lynnwood Convention Center and the recently expanded Lynnwood Recreation Center. We have grown to a company with over 100 employees. We think that we are a company that most cities would love to have within their borders.

When we decided to build our own building several years ago, we looked at several locations. We were happy to find our current location on Cedar Valley Road. We liked the access to the Park and Ride, access to freeways, the close proximity to Scriber Creek Park, the quiet residential adjacent neighborhoods, the Interurban Trail and all the greenbelt around us. During our building process we spent thousands of dollars on native growth area restoration and wet land buffers on the edges of our property. We gladly did this as it was clear that this would only enhance the natural park like environment of this neighborhood.

Now we find out that Lynnwood Link Extension Options C-1 and C-2 will mean an elevated concrete structure coming right down the side of 52nd Ave W and Cedar Valley Road. How can this even make sense? These two options destroy homes and businesses. Even if your home or business is not destroyed by this project, what results is an ugly towering concrete structure right through the neighborhood. The proposed Light Rail from Northgate to Lynnwood closely follows the I-5 alignment except for Options C-1 and C-2. Why would the line deviate from I-5 in Lynnwood? Option C-3 (and C-4) would follow the I-5 alignment on mostly vacant land, with the least impact to homes and businesses. These options would also preserve Scriber Creek Park.

Who would want to have this concrete monster in front of their home or business? The noise will be unbearable, especially on the proposed curved track. These concrete structures will eventually be covered with graffiti and this

neighborhood will become a low rent industrial wasteland. Property values will be diminished and the city of Lynnwood will lose a very nice part of this town. This a critical decision for the future of our community.

The only sensible solutions are the C-3 or C-4 options.

Respectfully Submitted,

Michael J. Mayes, P.E. | President

Lynnwood Link and Disproportionate Impact of Alternative Routes C1 and C2

Subject: Lynnwood Link and Disproportionate Impact of Alternative Routes C1 and C2

Dear Ms. Somers:

A 60 day comment period is simply not enough time for most members of the pubic to review, understand and then comment on the DEIS which, with its supporting technical reports, is more than 2000 pages in length. Further, the DEIS was published at the end of July and the comment period ends on September 23. Many people are on vacation. Lynnwood's City Council has been on hiatus, and many government agencies have shortened schedules and have not been available to answer our questions.

PERPLEXING PUBLIC COMMENT PERIOD

In addition to being too short, the DEIS public comment process is confusing by its references to two alternative C1 routes and two alternative C3 routes. It is impossible to tell where each route begins and ends. This review is made even more difficult because the Technical Reports almost never specifically cite to the sources or studies that supposedly support the analysis and conclusions, and even then the Technical Reports contradict each other.

INADEQUATE CHOICES

The number of alternatives are insufficient and limited to a false choice among routes that cross protected wetlands and in one or possibly two alternatives under C1, a (4f) protected property, Scriber Creek Park, that was purchased with Conservation Futures funding. The City of Lynnwood and Sound Transit did not even know the source of the park's funding until the last week in August. Further, it has yet to be determined whether the wetlands in alternatives C2 and C3 were also purchased with Conservation Futures funding because the maps provided in the DEIS, the City's maps of the same areas, and the naming conventions used in these maps differ depending on who created them.

NEPA requires that an EIS offer a wide-range of reasonable alternatives so that the decision-makers and the public can see and evaluate the various environmental trade-offs involved before deciding on a particular course of action. Neither alternatives C1 nor C2 are reasonable. C3 seems like the most

reasonable alternative because it may (it's hard to tell from the DEIS) impinge the least on the wetlands. However, those wetlands may have been bought with Conservation Futures funding. Again, the maps are inconclusive.

The DEIS's authors did not even attempt to find alternatives that addressed transportation demand in ways other than tearing apart a neighborhood, a park and wetlands.

MISSING AND INCOMPLETE PARTS

The DEIS chose to put off or ignore the legally required analysis regarding several key aspects of this project's environmental impacts. As for the analysis the DEIS does include, it is often misleading, contradictory and so perfunctory that it doesn't make any sense as follows:

The DEIS fails to provide any real useful information regarding impacts to ecosystems, and its Technical Report also offers almost no specific analysis or citations to scientific research or sources. The DEIS's legally required 4(f) analysis of impacts to public lands is incomplete and fails to justify that such impacts are unavoidable or de minimis. It contains absolutely no detailed or final analysis regarding impacts on the endangered salmon species and trout that use Scriber Creek and fails to even mention the several Native Growth Protection Area signs scattered throughout the properties impacted by C1 and C2.

Finally, The DEIS contains an insufficient analysis of the disproportionate impacts of the project on Environmental Justice populations (routes C1 and C2 consist of diverse communities), including adverse effects from noise and air pollution, not to mention the psychological impact of having half the neighborhood bulldozed to the ground and replaced with a concrete jungle that will be begging for Graffiti.

Thank you so much for any help you can provide as our neighborhood is severely distressed and mystified as to why these are the only routes under consideration.

I-268-001

The Latvian Center has been an important part of not only my life, but my parents and every Latvian that I know. It would greatly saddden me & my community if for some reason we couldn't attend the church or the Latvian centers services anymore. I would like to see changes made in the plan of the project, so that it doesn't impact the Latvian center = Latvian community. Without the center I don't know where I would go to "my own" church & services as well as help out & volunteer w/ the center.

Sincerely,

Ieva Wema

SOUNDTRANSIT RIDE THE WAVE

I-268-001

Thank you for describing the importance of the church and center to your family and community. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Latvian Hall (Nams) in Seattle

Being blessed with a few friends that are Latvian I just have to say that everyone of them I have ever spoken to at any length has talked about the Latvian Hall (Nams) in Seattle without fail. They all speak of this place as if it is like their own home but with many more wonderful memories, experiences and time spent there then could ever be had at one's own home.

I-269-001 It would just be a shame to see any of this historical property with so many peoples wonderful memories lost!

Sincerely,
David Anderson

I-270-001 Your proposal to displace our Seattle Latvian Lutheran Church is unacceptable. This is not the first time we have been forced to move. But this site we built up ourselves and has grown to support the entire local Baltic community. You may consider this an ethnic church with some members residing some distance away. I believe the majority factored in proximity and access to church when deciding upon their place of residence. It is an extension of our homes. If you take away this one building, you will also be asking hundreds of people to consider moving. Again. You may have that legal right, but you would be wrong to do so.

Based on the Draft EIS Round & Station Alternatives C1, C2, C3-OPT1 & C3-OPT2, what is the impact for each alternative relative to the following questions:

1. What impact would there be relative to north & south automobile traffic from 44th Ave W & 188th ST SW to 20610 44th Ave W (Embassy Suites Lynnwood North)?

2. What impact would there be relative to east / west traffic from 188th ST SW, 196th ST SW, 194th ST SW & 200th ST SW from 40th Ave W to 52nd Ave W?

3. What impact would there be for access to south bound I-5 from 44th Ave W & 36th Ave W?

4. What impact would there be for access to north bound I-5 from Popular Way?

Please provide responses to questions 1 – 4 addressing their impact relative to C1, C2, C3-OPT1 & C3-OPT2 to e-mail address: sig516ar@comcast.net or to the physical address below.

Chapter 3 of the Final EIS details the performance of more than 20 intersections that Sound Transit and the City of Lynnwood identified for detailed analysis, as well as potential mitigation for impacts for each of the alternatives. The assessments were based on predictions of future traffic with and without the project, particularly in the areas where existing or future conditions already created traffic problems in the No Build condition, and where station area traffic would result in an increase. For the Preferred Alternative, Sound Transit identified improvements to mitigate congestion on 200th Street SW, including 44th Ave W. Traffic along 52nd or 188th Street SW is not expected to markedly change due to the project.

Subject: Latvian Church/Center

Greetings Seattle Sound Transit Organization,

My name is Janis Klavins, and my Latvian heritage is of great importance to me. The Seattle Latvian Lutheran Church/Center has been and continues to be an integral part of my life. It is a place of worship and education that has fostered Latvian Seattle residents to become pillars of the Latvian as well as the local American community.

I-273-001 Please reconsider placing the light rail in the parking lot, as it will make the church and center unusable for its members.

Regards,

Janis Klavins

Subject: Latvian Lutheran Church and Community Center - Light Rail proposal

Re: Latvian Lutheran Church and Community Center - Light Rail proposal

Good afternoon -

I have visited the Latvian Lutheran Community center about 5 times in the last 10 years. Each of these times I have seen an increasing amount of activity, and higher participation level, than at previous events at the Center.

I-274-001 Although I live far from Seattle - 10 states away - it is apparent that the light rail plans and their effect on the Seattle Latvian Church and Center have caused a lot of concern among the Latvian Center members/participants. I am writing to request that you fully consider their opinions during the evaluation process about the effect of these plans on the Center's operations.

Thank you for your consideration, even of this e-mail from an out-of-area out-of-stater!

Subject: Sound Transit Board - Lynwood Link Extension

To Whom It May Concern:

I am writing in response to the proposed Lynwood Link Extension project. It is my understanding that this rail extension, would impact the Seattle Latvian Evangelical Lutheran Church & Center.

My husband was born and raised in Seattle. I met him for the first time at the Seattle Latvian Evangelical Lutheran Center. The American Latvian Youth Association held one of our board meetings at the center, which was followed by a social evening for Latvian youth and their friends.

This place holds deep meaning for my husband's family, friends - and now us, as a couple. It holds deep meaning to the Latvian community both in Seattle and throughout the United States. Every major city in the US has a Latvian Center like the one that the Lynwood Link Extension is putting at risk. These centers are where we all (including myself growing up in Michigan), went to Latvian school as children, where we were baptised, confirmed, and married.

Although I am not a resident of Seattle, every time we visit my husband's family, there is some kind of function at the Center. We look forward to spending time at the Center, watching Latvian folk dancing, talking with family and friends and celebrating our culture and history.

I-275-001 Please consider and alternate route for this rail extension project. The impact this would have on the local Latvian community would be devastating. I cannot imagine if this happened to the Latvian center where I grew up.

The Latvian culture is a strong one. For Latvians who fled during the Soviet occupation and created new lives for themselves in the United States, this center is their home. It is not just brick and mortar. It holds deep cultural, spiritual meaning and I urge the Sound Transit Board to reconsider its extension plan.

Thank you for your time and consideration.

Regards,

Mara Lidacis

Subject: Latvian Center, Seattle , WA

I am writing you in response to your proposed transit changes which would impact the Latvian Center. Because we presently live in Olympia, it is difficult to attend meetings in Seattle regarding the proposed transit plans.

We(a Latvian/Lithuanian heritage family) have been regularly attending cherished functions at the Latvian Center since 1985. We have participated in weddings, funerals, yearly Independence Day commemorations and other joyful festivities such as St. Martin's Eve with the 3 Baltic communities and extended friends. One of our children was married at the Latvian Center's church. Our children have grown up with a strong connection to this place, and our hope is that our grandchildren will, too. There is a particularly unique motif at the Latvian Center which unites our distinct cultures. If you just step into the welcoming entry way, you may feel it too; the echoes of generations simply and powerfully sharing life.

I-276-001 It would be a great shame to eviscerate this strong cultural bond, especially if other avenues for transit are available. Like the old song says, are you going to "pave paradise and put up a parking lot?"

Thank you for reading this.

Sincerely,

Danute Musteikis-Rankis & extended family

September 11, 2013

Laura Swift
401 S. Jackson Street

Seattle, WA 98104

I-278-001

My name is Rolands Juris Abermanis. I am a member of The Seattle Latvian Evangelical Lutheran Church/Center. By now I'm sure your knowledge of the history of displaced Latvians is broadened significantly and I would like to share my concerns for the proposed plans for our church and community center. My parents fled their homeland of Latvia in the midst of WW II. They were very fortunate to be able to come to the United States of America to restart their lives. They settled in Detroit, Michigan and with other members of the Latvian community organized and established their church and community center, as displaced Latvians did all over the country. I was born in Detroit and for the first 4 -5 years of my life knew only one language, Latvian. I graduated from our local Latvian school, participated in our local folk dancing group and made lifelong friends. After finishing college in Louisiana, my wife and I started our family. Our children Andris and Helena were born in New Orleans. The total Latvian population in New Orleans, including our family of four, was six. Our Latvian heritage and culture would have probably come to an end if we had remained in Louisiana. My wife Jennifer and I wanted to give our children the memorable experience of learning the Latvian language along with traditions and cultural rituals that can only be experienced in a Latvian cultural center. That chance came when my wife's work offered us a move to Seattle. We immediately became members of the Latvian community in 1997. I gave up a career of 16 years in the petroleum industry so that my children would have the same opportunity that I had. Our family has now been a member of The Seattle Latvian Evangelical Lutheran Church/Center for more than 16 years. My children have graduated our Latvian school, know the language, and have made lifelong friends in "THEIR" Latvian community. Latvians have been displaced from our country of origin by the Soviet regime and now by their adopted homeland, specifically Seattle Washington. is planning on displacing us once more. Losing or altering our place of worship and cultural center will be to some elderly the last straw. For many of our elderly, this is a repeat performance of what happened to our original cultural center in 1969, to build of all things "a playfield". You know our stories and many of them sound very familiar. We "Latvians" are a very proud and hardworking people we will survive. Thank You. Awaiting your reply.

Respectfully,

Rolands Juris Abermanis

I was not born into the Latvian community, but rather adopted by it. When my husband and I met 15 years ago our first date was a New Year's Ball at the Latvian Community Center. My first hint that this community was a very close knit family was when my date turned to me at midnight and excused himself so he could go to the next table and wish his grandparents (and all of the other members of the older generation) a happy new year. From that night on I knew that the Seattle Latvian community was the most supportive, connected, intergenerational community I had ever seen or heard of. I was quickly adopted into this family of over 700 core members despite my lack of knowledge of their culture or language. Since my adoption I have been patiently taught about culture, dance (I have been an active member of Trediksnis folk dance group for over a decade), the importance of human connection, and even a few latvian phrases:). None of these things would have been possible and I would be a cultural orphan in this city without the Latvian church and community center. This place is where I learned about family, heart, and the Latvian culture, and continues to be one of the only places I feel truely at home and accepted as I am. At the Latvian Community Center I have a purpose greater than myself.

The Latvian Center has been a part of my life since before I can remember. It is hard to separate my life from the Latvian community. My dad grew up here and my mom joined him when she moved here from Latvia. My grandfather also helped build the Center. I feel like I have a community that I belong to, which is facilitated by this Center. Here we have a place to gather which accomodates a range of activities from Latvian card game night to a New Year's Eve dance party. Here we have a place to come together. I attended Latvian school here and remember the plays we put on, the Latvian poems that we memorized and delivered. My friends from school have come and gone now that I am in college, but my Latvian friends have lasted. I feel like they will be there for me, always, no matter what. It would be exceedingly difficult to meet with all of them if the Latvian Center no longer existed in the capacity that it does now.

SOUNDTRANSIT

I-282-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Seattle Latvian Center

Dear Sound Transit Staff:

I am a member of the Lithuanian-American community of Seattle. Our country has been built by immigrants from many countries to include those from the Baltic States of Lithuania, Latvia and Estonia. Immigrants from these nations have made many significant contributions to our country over the last several centuries. My parents were forced to leave their homeland of Lithuania due to the ravages of WWII and were welcomed warmly in their newly adopted country of America. My own mother who is Lithuanian was first welcomed to freedom in a Latvian Displaced Person camp in post WWII Germany and attended a Latvian school. Such gathering places such as the Seattle Latvian Center have maintained that same tradition and welcome new immigrants. These centers have been integral in integrating new immigrants into the American mainstream.

Upon arrival to the United States, my parents were welcomed warmly in a facility that is almost identical to the Seattle Latvian Center. In almost every major American city there are community centers and churches that were founded by Baltic immigrants. They have served as a welcoming place to individuals who wished to preserve their cultural heritage. Such community centers played an integral part in facilitating the independence movement in these countries in the late 80s and early 90s that led to independent democratic states of Lithuania, Latvia and Estonia. Schools, folk dance groups and other organizations flourish around these types of centers. Existence of this center was key for establishment of the Baltic Studies program at the nearby University of Washington. The City of Seattle takes pride in the accomplishments of all of its immigrants, yet now a major construction project threatens the very existence of the Seattle Latvian Center.

I-283-001

It has come to my attention that the Seattle Latvian Center could be closed for an extended period of time due to construction of a light rail line or even outright closed. This center plays a vital role for the Baltic community here in the greater Seattle area. In these difficult economic times it is not feasible to just to "pull up the stakes and set up camp elsewhere". I kindly request that integrity of the Seattle Latvian Center be maintained and that adequate parking and access be allowed during these difficult times. A forced relocation or closure of this facility would be a terrible blow to the Seattle Baltic community. I strongly urge you to keep the Latvian Center open as it plays a significant role in our community.

With kindest regards,

Arunas T. Banionis, D.O.

Sound Transit wants to hear from you. Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

FOR THOSE OF US WHO EITHER LIVE IN THE NORTH OF NORTHGATE RESIDENTIAL COMMUNITY, OR PRAY AT THE LATVIAN LUTHERAN CHURCH, MY CONCERN IS AS FOLLOWS,

I-284-001 THE TRAIN TRACKS ARE PLANNED THRU THE COMMUNITY, CREATING DESTRUCTION OF PROPERTY, BUT THERE IS NO BENEFIT TO THE COMMUNITY. NOT HAVING ANY STOPS BETWEEN THE NORTHGATE TRANSIT CENTER AND SOMEWHERE NORTH OF 130TH STREET, DOES NOT ALLOW THE COMMUNITY TO USE THIS TRAIN SERVICE. THEREFORE, THERE IS NO BENEFIT, ONLY DISRUPTION.

SOUNDTRANSIT RIDE THE WAVE

I-284-001

Thank you for your comment. The Lynnwood Link Extension light rail project is designed to be a benefit to all who travel the corridor between Northgate and Lynnwood. The potential station at NE 130th Street is approximately 0.7-0.8 miles north of the Latvian Evangelical Lutheran Church, while the Northgate Station is approximately 1.5 miles south of the church, but with bus service, or by bike, walking, or by car, the station would be accessible to church or center users. Bus services may also be realigned to better serve the rail station, which may help improve transit access; however, any bus realignment would be determined by King County Metro.

I-285-001

AS A LONGTIME MEMBER OF THE LATVIAN LUTHERAN CHURCH, I AM VERY CONCERNED ABOUT THE IMPACT AND CHAOS THIS PROJECT WILL CREATE. IT WILL CHANGE OUR WAY OF LIFE AT THE CHURCH AND THE UNIQUE CULTURAL CENTER, THE ONLY ONE IN THE STATE OF WASHINGTON.

IF THIS PROJECT REQUIRES THE LOSS OF THE PRESENT ACCESS, PARKING, AND THE CARETAKER'S HOUSE, MY EXPECTATION IS THAT SOUND TRANSIT WILL PROVIDE FAIR AND JUST COMPENSATION FOR THE PROPERTY LOSS. ALSO THE SAME APPLIES TO DAMAGE DURING CONSTRUCTION, PLANNED OR ACCIDENTAL.

SOUNDTRANSIT RIDE THE WAVE

I-285-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describing the acquisition impacts; Section 4.4 describing impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Subject: Friday webcast

Gentlepeople,

I-286-001

I just learned about the three Lynnwood alternatives during a nature walk I gave at Scriber Lake Park on Sunday in conjunction with Edmond's Puget Sound Bird Festival. We quickly collected 28 signatures supporting Alternative C3 because of its minimal impact on Scriber Creek Park. Of the 28 signatories eleven separate municipalities are represented in Snohomish and King Counties. So like the light rail itself, the park is not just a town asset, but a regional asset.

The Environmental Project Engineer stated during today's webcast that C3 has little or no impact in Scriber Lake Park.

I am requesting the Pilchuck Audubon Society Board of Directors to take a position supporting C3.

I will mail in the petitions this afternoon.

Subject: Proposed Light Rail Project and the Latvian Center

To Whom It May Concern,

I-287-001 I am a member of the Seattle Lithuanian-American Community and a supporter of mass transit. That said, I would like to express my concerns for the current proposals to build a light rail station adjacent to the Latvian Center in Northgate. First, I do not believe Sound Transit has acknowledged the cultural significance of this site in its planning process. Second, the physical interruption of construction and operation of an overhead light rail line would imperil the ability of community members to celebrate our cultures and traditions.

For all 22 years of my life, the Latvian Community has been gracious to open the Latvian Center to the Lithuanian-American Community for large and small events. Every Sunday, my Lithuanian folk dance group practiced in the basement of Latvian Center for Vasario Sesiuolikta (February 16th), our annual Lithuanian Independence Day Celebration, which is still held at the Latvian Center. As a former member of the Soviet bloc, we take this celebration very seriously. These events turned into memories are formative to my parallel identities as a Lithuanian and a Seattleite, and I would be disappointed to see the latter cross the former.

I-287-002 Seeing that many cultural groups routinely use the Latvian Center for preparation and celebration, Sound Transit should strive to interrupt these activities as little as possible in the construction and placement of the new light rail line. Please take whatever steps necessary to mitigate noise and destruction both during construction and once the train is running. We would prefer the grade-level

I-287-003 option for this. It is also important that the Latvian Center remain accessible through the maintenance of the caretaker's house and the abundance of parking, so as not to disrupt the neighborhood during events attended by hundreds of people. A seizure of the property by eminent domain - or the disregard of the physical conditions created by construction of a light rail line - would show disrespect for the history and culture of the Baltic States and our diaspora's presence in the United States of America and the Pacific Northwest.

Please consider our community's well-being as we expand connectivity across the region.

Thank you,
Jonas Deltuva Buck

1

I-287-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

I-287-002

The noise analysis for the Lynnwood Link uses the FTA impact criteria and Sound Transit mitigates noise impacts to levels below these criteria. Sound Transit's policy is to mitigate moderate or severe impacts as per FTA criteria. Potential mitigation measures for noise are described in Section 4.7.7 of the Final EIS.

Noise walls are planned for all alternatives in this area, either at-grade or elevated, as mitigation for the light rail impacts. For construction, the local construction noise ordinance would be applicable, and Sound Transit is committed to maintaining construction noise levels within the criteria. Further, construction noise for this project is similar to construction noise for a paving project, building construction, or any other construction projects, and Sound Transit would work with local residences and businesses to minimize construction impacts.

For nighttime construction, which will likely be required due to the heavy volumes of traffic on I-5 and other arterial roads, a noise variance would be required from each of the cities where construction would be performed. During that time, Sound Transit will work with the local

jurisdiction to arrive at construction specifications that minimize construction-related impacts to nearby communities.

I-287-003

Thank you for your comments expressing concern about the potential impacts to the Seattle Latvian Evangelical Lutheran Church property. As mentioned in the response to comment I-287-001 above, Sound Transit has redesigned the Segment A alternatives so that none of them would displace the church or center. The caretaker's residence would need to be relocated due to the realigned roadway, but Sound Transit would provide for the relocation. Parking supply would also be maintained for the church and center.

Comments

I would like to point out that the Latvian Church and community center represents the social matrix and fabric of a great many people - hundreds, perhaps thousands.

Losing the church/center would shred that fabric - from children to youth to senior citizens.

The human cost of such can not be calculated in dollars and cents.

Please consider this in your deliberations.

J Cilnis, MD

CONTINUED ACCESS TO THE LATVIAN CENTER IN SEATTLE AT 11710 3rd Ave NE IS CRITICAL TO THE FINANCIAL SUSTENANCE OF OUR FACILITY. WE HOST AN ANNUAL RUMMAGE SALE WHICH OFFERS A WIDE RANGE OF HIGH QUALITY GOODS DONATED LARGELY BY MEMBERS. THIS BENEFITS US AND THE GENERAL PUBLIC, AS WELL AS OTHER CHARITIES WHO RECEIVE OUR LEFT-OVER MERCHANDISE. WE HAVE SOLD OVER $200,000 OF GOODS OVER THE PAST 15 YEARS, WITH A STEADY, IMPROVING TREND. THIS WEEK-LONG EVENT TAKES PLACE IN APRIL, AND OUR MANY REPEAT CUSTOMERS EAGERLY ANTICIPATE RETURNING EVERY YEAR.

THUS, AS CHAIRMEN OF THIS SALE FOR THE PAST SEVEN YEARS, WE STRONGLY FAVOR A DESIGN WHICH PRESERVES ACCESS DURING CONSTRUCTION AND MINIMIZES LOSS OF ANY PART OF THE PROPERTY.

Memorandum

To: Sound Transit Board, c/o Lauren Swift

From: Ian D. Cotton, PE, LEED AP

Date: 9/19/2013

Re: Lynnwood Link DEIS Comments

I am writing to propose an alternate route to the C1, C2, C3 routes as proposed by Sound Transit in the Draft Environmental Impact Statement.

I-290-001

The routes as proposed by Sound Transit have the following negative impacts:

- C1: Noise, displacement, aesthetics to large Single Family zone community. Wetland and park impacts. Displacement of businesses. Impact to School District property.
- C2: Same as C1.
- C3: Wetland and park impacts. Future impact to multiple businesses as future extension takes route directly into existing hotel. Negatively impacts future development efforts in the Lynnwood City Center.

I-290-002

Please see attached the mark-ups to the Draft EIS drawings C1M-PP03, C2M-PP03 and C3M-PP02. This propose routing has been laid out using the minimum track curvatures as taken from Sound Transit Draft EIS drawings.

This proposed routing is far from Single Family zoned communities, avoids businesses and School District property, minimizes the crossing of the wetlands, and aligns the future extension of the track with a major roadway should voters approve ST3 light rail extensions. In addition this alignment places the station near the bus terminals at the SE corner of the existing bus station preserving existing investment in infrastructure.

Please add this memo and attachments to the record of comments and input for the DEIS comment period ending on September 23, 2013.

Regards,

Ian D. Cotton, PE, LEED AP

Subject: Light Rail Extension

Gentlemen:

I have been a member of the Latvian Church and Association for many years. I have also practiced architecture in Seattle for more than
40 years and am currently retired. My former firm, Streeter/Dermanis & Associates, did a number of projects for the Department of Transportation.

I-291-001

Concerning the extension of light rail from Northgate to Lynnwood and the impact on the Latvian Community Center, several alternatives are being considered - grade level, elevated, other location.

There is an alternative that to me seems realistic and has not been given sufficient consideration - locating the rails in a depressed ditch covered by a concrete lid - similar to Battery Street tunnel in Belltown. This would eliminate almost all noise and visibility of the trains. The layout of the Latvian Center could remain as it is now with the entrance in the present location.

I think the cost of the depressed alternative will be higher than the
others. It may not be much higher than the elevated alternative.
The way to find out is to do a study with a layout and a cost estimate. Than the additional cost would be known in fairly exact numbers. It is not just the Latvian Center that would benefit from the depressed version. There are many other buildings, residential and commercial, that would also benefit.

To me the depressed version is the only one that does not have a major negative impact on the Latvian Center. I think Sound Transit should at least do a preliminary study to establish the additional cost of the depressed version.

Very truly yours,
Paul Dermanis AIA
116 NW 55th Street
Seattle, WA 98107

1

I-291-001

Thank you for your suggestion; Sound Transit has developed a different approach to avoid displacing the church and center. A retained cut alignment would still require displacement of the church because it would have an extended closure of the access road. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Sound Transit wants to hear from you. Comments can be about anything related to the project, ranging from giving an opinion or observation to discussing technical aspects of the environmental analysis. The extended public comment period ends September 23, 2013. All comments received or postmarked by this date will be responded to in the Final EIS.

Comments

I have been active in the Seattle Latinan Community since 1984. Moving up to Seattle to attend the University of Washington, one of the first things I did was come to an event at the Latinan Center to meet fellow Latinans and find ways to become involved w/ the community. Since 1984, I have performed as a dancer, attended church, participated in countless Latinan community events and functions, all located at the Seattle Latinan Center. Yesterday, my 2 year old son started Latinan school. With his Latinan activities and mine, we find ourselves at the Latinan Center 2-3 times a week. I absolutely can't imagine not having our Latinan Center and Church as a place to meet.

I-292-001 Both the Latinan Center and church are vital to the continuation of our culture and traditions. We are a culture that gathers. We gather to sing, to dance, to remember our ancestors and to pass on our traditions to the next generation. Losing the Latinan Center or even losing access to the Center and Church would be devastating to our Latinan community.

Sincerely,

Andrea Douglas

SOUNDTRANSIT RIDE THE WAVE

I-292-001

Thank you for describing the importance of the church and center to you and your family. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Comments for Lynnwood Link Extension - DEIS

Lauren,

I am writing regarding the potential impact of Sound Transit Link to Lynnwood for the following property:
Latvian Center
11710 3rd Ave N.E.
Seattle, WA 98125

This property is the gathering place for Latvian, Lithuanian and Estonian communities in the area. The communities celebrate national holidays and have special events in this building/church. Having the construction so close to the building might make the building unusable for such events. These events are important to keep our traditions alive and to communicate with other community members.

I-293-001 As an active member of Lithuanian community, I would like to ask you to please ensure that there is plenty of room to access this building during and after the construction. It would be great if we could have adequate parking as well. The center should not be closed during construction since that would cause the suspension of all community events and that would be unduly burdensome for our small community. I would prefer the at-grade option, not the elevated option.

I-293-002 Moreover, please mitigate as much as possible the construction and post-construction impacts (dust, noise, vibration, light) to this property.

If the relocation of the center were to be required, the relocation property needs to be the same size or bigger and it needs to be located in the same general location, since any dramatic change in the location or size of the Center would impact my use of the center greatly.

I-293-003 Another request I have is to consider extending the link north to Ash Way Park and Ride. The Ash Way Park and Ride is heavily used. The parking lot is very full by 7 am and it could use some extensions/upgrades.

Thank you for your consideration.

Very truly yours,
Ausra Gaigalaite
D 206.389.1704
agaigalaite@riddellwilliams.com

CONFIDENTIALITY AND CIRCULAR 230 NOTICE: This communication is intended for the sole use of the individual and entity to whom it is addressed, and may contain information that is privileged, confidential and

I-293-001

Your preference for an at-grade alignment that avoids the church is noted, and thank you for describing the importance of the church and center to you and your family. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-293-002

Although construction activities will be adjacent to the church, Sound Transit will work closely with the church to maintain access, minimize parking loss, and reduce other potential construction disruptions to ongoing church and center activities. The primary construction in the area would be ongoing for about 1-2 years in the area, but major construction activities would be shorter duration. For temporary impacts such as truck traffic, detours, noise, dust, light and glare, Sound Transit proposes best management practices to avoid and minimize impacts in Sections 3.6, 4.5.7, 4.6.7, and 4.7.7. The construction area would also be fenced to protect public safety.

I-293-003

Thank you for your suggestion to extend the light rail line north of the Lynnwood Transit Center to the Ash Way Park-and-Ride. The project evaluated in the Final EIS is limited to the extension of the light rail system between Northgate and the Lynnwood Transit Center. The Sound Transit Long-Range Plan, however, calls for the eventual extension of the light rail line further north to the city of Everett.

Subject: Latvian Church and Community Center

I and my family have used the subject property since it was built by the Latvian community with their own hands and their own financial support(I personally and my family were among the contributors).. We have been members of the Latvian Lutheran Church and the Latvian Association since 1960. We attend the church services regulary and use the community hall for many reasons such as sunday school, choir rehearsals, social functions, weddings,funerals, baptisms, confirmations, musical events, theater and many more. I was the conductor and music director of the Latvian Choir for 30 years with its top membership of 70 singers. The Latvian center was our home and totally essential for our existence then, and still is today after I retired. We organized West Coast Latvian Song Festivals, three of which were held in Seattle using Latvian community center for some of its functions.

I-294-001 The Latvian Lutheran Church and Community Center is the mainstay of the Latvian people who desire the liberty,freedom and the right to exercise their religious beliefs in their own church, further their ethnic culture through songs, plays, folkdancing and schooling of next generations in the facility that their own people built with their own hands, sweat and strain.

I hope, you can understand the immense importance for our community to retain The Latvian Lutheran Church and The Community Center in its current excellent operational status, availability to our people for reasons that are strong,will never change and, for people who have been oppressed by dictators and communism for most of their country's existence, can only be accomplished in our current home The United States of America!

Where there is will, there is a way!

Peteris A Galins
Retired choir director of the Latvian Community
16623 116th PL SE
Renton, WA 98058
pylgalins@aol.com

I-294-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church. The Preferred Alternative and other alternatives now avoid displacing the church and center. See Chapter 2 for a description.

Subject: Sound Transit Lynnwood Link of the Light Rail Project

To Whom It May Concern:

As a long-time resident (of more than 20 years) of Lynnwood, and as a resident/ homeowner at Cedar Creek Condominiums for that entire 20 years, I would like to voice my opinion on the route to be chosen for the Sound Transit Lynnwood Link.

I-295-001 I would strongly recommend the C1 Route as proposed by Sound Transit. It seems that this route has the least impact on wetlands and, as I hope most are aware of, wetlands are vital to our environment and general quality of life. There are reasons that federal guidelines have been put in place to protect these areas. To override or ask for exceptions to this extent would be short-sighted and a disservice to future generations. In addition, C1 appears to be the most convenient route for the existing park and ride - even the "proposed" C4 would be inconvenient and would disrupt traffic flow on I-5 for commuters so significantly that it could have far reaching consequences.

I-295-002 On a more personal note, I realize that C1 would displace Cedar Creek Condominiums, but I even find that to be a positive. These condominiums were built in 1977/ 1978. This makes them 35 years old. These condominiums were not built well and the upkeep is expensive. The Association has an annual operating budget in excess of $330,000.00, with the current cost of homeowner dues being in excess of $350 a month. The expectation is that this dollar amount will only increase over the years, and we are already experiencing a high rate of delinquencies and foreclosures. This can only mean that the upkeep of these condominiums will diminish over time. The value of these condominiums have already decreased significantly over the past years - to less than half of what they were valued at five years ago.

Again, as a homeowner at Cedar Creek Condominiums, I would personally like to recommend the utilization of Route C1. Thank you for taking the time to count my voice!

THE LATVIAN CENTER/CHURCH IS A GATHERING PLACE FOR LATVIAN-LITHUANIAN/ESTONIAN DECENT PEOPLE TO MEET AT AND PARTAKE OF THEIR HERITAGE. FOR ME, I JOINED THE LATVIAN CHURCH AFTER TRYING OUT "AMERICAN" CHURCHES BECAUSE I MISSED WHAT I GREW WITH IN LINCOLN NEBR. I MOVED TO SEATTLE AREA 8 YEARS AGO, I DO COME HERE TO SEE LATVIAN THEATER GROUPS' PLAYS, MUSIC PROGRAMS, DANCE PROGRAMS, LATVIAN INDEPENDENCE DAY COMMEMORATION PROGRAMS, ETC. THE CENTER/CHURCH IS USED FOR MANY CULTURAL PROGRAMS, GET TOGETHERS, ETC. IT IS IMPORTANT NOT ONLY TO ME BUT TO ALL THOSE CULTURAL GROUPS WHO COME HERE USE IT. WE NEED TO KEEP OUR HERITAGES ALIVE and THIS CENTER IS A WONDERFUL MEANS TO DO SO. EVEN 5 YEAR OLDS ENJOY COMING TO LATVIAN LANGUAGE/HERITAGE CLASSES ON SATURDAYS (MINE WERE ON FRIDAY NIGHTS IN LINCOLN).

I-296-001

I HAVE HEARD FROM LITHUANIANS AND ESTONIANS WHO ALL SAY THE SAME THINGS FOR THEIR HERITAGES. PLEASE LET US ALL KEEP THIS CENTER FOR OUR USE IN THE FUTURE. IF IT GOES AWAY, IT WILL PROBABLY BE THE END OF CULTURAL HERITAGES FOR MANY PEOPLE.

September 17, 2013

Dear Sound Transit Board

My name is Karl "Karlis" Grendze and I am an active member of the Latvian Community in Seattle Washington. I am a council member of the Seattle Latvian Lutheran Church and Vice Chairman/Facilities Director of the West Coast Latvian Education Center in Shelton, WA.

I arrived in Seattle, on September 6th 2004, when I showed up Labor Day that year in truck towing my boat, hope and a few other things. I just came off a 2003 year where my entire life collapsed in front of my face, my father passed away, my wife left me and I lost my job, while I was living in Orlando, FL. After a tough year I decided that restarting in a new community would be the healthiest way for me to recover.

In my past I have able to travel throughout most of the continental United States. When I came to Seattle in 2002 to visit one of my best friends, who had moved here seven years prior, I fell in love with the Pacific Northwest and I promised to myself that if opportunity ever presented itself that I would move to Seattle.

One of the most compelling reasons I came to town was vibrancy and involvement of the local Latvian Community. During my twelve years in Orlando a big part of me was missing as it does not have a Latvian Community. The Latvian Community was the tipping point in my decision to move here and is a key reason I am still here and active.

I-297-001 The Seattle Latvian Church and Community Center is the epicenter of the Baltic Community in the Pacific Northwest and arguably the entire West Coast. Without this facility I would not have had a community to come to and most likely would not be here. Any disruption to this vital cultural hub would be detrimental and would diminish the rich and diverse essence that makes the Puget Sound Area unique and world class.

As a registered voter, community volunteer and contributing member of this community I ask that you consider the cultural significance of our facility when finalizing the plans for the Lynnwood Link Extension. Most Latvian agree and support light rail, our hope is that Sound Transit Board recognizes us and is willing to work with us to mitigate the potential negative impact of this project.

To Whom it May Concern:

As an 18-year long owner of a single family residence at 18733 12th Ave. N.E., Shoreline, WA 98155, I have great concerns regarding the impact of the future transit station. I have reviewed the alternatives for the parking lot locations and given thought to the increased traffic on various streets.

I-298-001 I STRONGLY support the A1 parking alternative for the following reasons:

1. The location (west side of I-5) would spread the impact between both sides of I-5, with the new station on the east side of I-5.

2. There is a far greater percentage of the Shoreline population on the west side of I-5.

3. The location allows the parking lot to be tucked into the hillside without encroaching on the stadium, causing less of a negative visual impact.

4. The A1 alternative is less costly and less noisy, being at grade level and not elevated.

5. The A-1 alternative does not require people to lose their homes.

I-298-002 5. Perkins Lane and N.E. 188th St. are links between 15th Ave. N.E. and 10th Ave. N.E. These are narrow roads without sidewalks and visibility is poor as one travels up and down the windy roads. As it is, people in and outside the neighborhood drive in the middle of the road and too fast. There are many children and pets in these areas. One elderly lady on N.E. 188th walks to North City to shop and go to church practically every day. These streets CANNOT handle any increased traffic that would certainly occur if the parking lot were in the vicinity.

Thank you for your consideration,

Monica Haynes
18733 12th Ave. N.E.
Shoreline, WA 98155
(206) 300-9802

I-298-001

Thank you for your comment stating your preference for Alternative A1 and the specific advantages you see with placement of the parking garage for the NE 185th Street Station on the west side of I-5.

I-298-002

Thank you for describing your concerns over additional traffic on neighborhood streets. It is anticipated that less than 10% of station related traffic will originate east of 10th Avenue, which lowers the potential that cut-through traffic would be a problem on neighborhood streets. However, section 3.6.5 describes the mitigation measures Sound Transit proposes to minimize potential impacts.

I-300-001

Dear Sound Transit, As a member of Latvian Community, I am very concerned that we may loose our Center and church due to Lynnwood Link Extension. Latvian Center has been the spiritual and Cultural home for me and my family for decades. Our three daughters attended Latvian language school there, danced folkdance and made friends for lifetime. Christenings, confirmations, weddings and funerals happen at our church. We, the senior citizens have our monthly recreational meetings at Latvian Hall. This month professional drama group from Latvia is presenting a play and the President of Latvia is due for a visit. We are better American citizens because of what we get by being members of this Community. Are we going to to have to loose it ? Sincerely, J. Jansevics

I-301-001

NO! NO! NO! We do not want this to be the end of the line for the Latvian Community Center.

This Lutheran Church and Community Center is the HEART OF LATVIANS in Seattle and its surrounding areas including Canada. The Lithuanian and Estonian communities also use this complex and have no other place to gather.

My husband and I travel two hours from Whidbey Island to attend many of the events held there and would feel a great loss if it were closed or moved. THE CENTER IS A SPIRITUAL, SOCIAL, and EDUCATIONAL STRONGHOLD.

The Baltic culture is fragile due to the 50 year Soviet occupation that included massacres and displacements of Baltic people. The center has been and continues to be an ESSENTIAL FACTOR IN HEALING THE PEOPLE.

PLEASE, PLEASE DO NOT LET THIS COMMUNITY CENTER BE DISPLACED!

Peter and Liga Jefferds

I have lived in this area since 1957 but was born in Riga, Latvia in 1943. Briefly lived in Ontario, Canada from 1948-APR. 1957. My parents (both Latvian) never let me forget my heritage. I speak Latvian and my daughters have kept up with the Latvian culture. They were both born here in Bellevue, Wa., but have had the opportunity to go to Latvia along with their children. How can you possibly even think of taking away the Latvian Communities place of worship & cultural experiences. I want my children and Grandchildren to NEVER give up their history. You really need to pursue other options. We may be a small group, but be assured that we are extremely Incited.

Subject: Save the Latvian Church and Center in Seattle

I-305-001

To Whom it may concern:
My name is Zinta Kulits, nee Mekss , a refugee from Latvia during World War II. At that time I was less than 7 years old. My parents, father ,a Lutheran minister and mother professional musician ,did all they could to instill in us the love for our native language.We were sent to a Latvian grade school in a DP camp in Germany, our home language was Latvian, we also learned German and later learned English.There was and is respect for the language of our host countries.The same love for our language is instilled at the Latvian Center in Seattle, we attend church services there , sing our folk songs, young people practice folk dances.Children attend Saturday school where the third generation of Latvians in America are learning the language of their grandparents.
I can not express the dread I feel if we should loose this precious place.
Latvians are not the only ones who use the Latvian Center in Seattle, other Baltic people use it as a gathering place.
PLEASE do not make us close the doors to so many people.There must be another way ,another route for the transit train without destroying this treasure.
Sincerely, Zinta Kulits

I-306-001

I WOULD LIKE TO EXPRESS MY DISMAY AT THE POSSIBLE ELIMINATION OR AT THE VERY LEAST DRASTIC INTERRUPTION OF ACTIVITIES AT OUR BELOVED LATVIAN CENTER. I AM ACTIVE IN THE LATVIAN LUTHERAN CONGREGATION, BELONG TO THE LADIES COMMITTEE, AND REGULARLY ATTEND CHURCH SERVICES. I ALSO PARTICIPATE IN THE SEWING GROUP, LEARNING AND TEACHING THE MAKING OF LATVIAN FOLK COSTUMES AND MANY OTHER ETHNIC ITEMS. EVEN MORE IMPORTANT, I ALSO SERVE ON THE BOARD of DIRECTORS of the LATVIAN ASSOCIATION of the STATE of WASHINGTON. WE ARE ACTIVE IN BRINGING MUSICIANS, THEATER GROUPS, LECTURERS, AND EVEN THE PRESIDENT of LATVIA himself to our CENTER. The CENTER hosts MANY and VARIED functions; EVEN AN INTERRUPTION for CONSTRUCTION would SEVERELY IMPACT OUR ACTIVITIES. THE NOISE and VIBRATION of TRAINS going by would HAVE A CONSIDERABLE NEGATIVE EFFECT ON THESE ACTIVITIES.

I GREW UP IN THE LATVIAN COMMUNITY IN CLEVELAND, OHIO WHERE I WAS BORN. LATER THERE WAS SCHOOL, MARRIAGE, THE DEATHS of MY PARENTS AND PHYSICAL INACCESSIBILITY to A LATVIAN COMMUNITY. WHEN I MOVED HERE IN 1992 AND FOUND THE LATVIAN CENTER IN SEATTLE, IT WAS LIKE COMING HOME AGAIN.

PLEASE REVIEW YOUR PLANS AND SAVE OUR CENTER AND OUR ACTIVITIES. THE FUTURE of THE LATVIAN CULTURE IN SEATTLE, OUR CHILDREN'S INVOLVEMENT IN THEIR HERITAGE, AND THE ACTIVITIES of UNTOLD NUMBERS of PEOPLE of BALTIC HERITAGE depend ON IT.

THANK YOU. Daina Kusins

As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Latvian Church and Community Center

Dear Sound Transit,

I-307-001 I am writing as a member of the Estonian community and in general the Seattle Baltic community to request that the Latvian Church and Community Center remain open during the planned Lynwood Link Extension DEIS construction and to remain in it's present location longer term. The community center serves as a focal point for key community gatherings, fund raisers and church services, so special to have a place for people from Estonia (Latvia and Lithuania) and with Estonian heritage to meet at when we are so far away from our tiny country overseas. The funds of our community are limited, thus trying to fund the relocation of a community gathering place would simply not be possible. We fear it would be a catalyst to our continued ability to gather and celebrate our cultures and religious services. We request that the construction planning take into consideration the long-term sustainability and maintenance of the property and the building.

Thank you – Krista Leesment

1

I-307-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Although construction activities will be adjacent to the church, Sound Transit will work closely with the church to maintain access, minimize parking loss, and reduce other potential construction disruptions to ongoing church and center activities. The primary construction in the area would be ongoing for about 1-2 years in the area, but major construction activities would be shorter duration. For temporary impacts such as truck traffic, detours, noise, dust, light and glare, Sound Transit proposes best management practices to avoid and minimize impacts in Sections 3.6, 4.5.7, 4.6.7, and 4.7.7. The construction area would also be fenced to protect public safety.

Subject: Comment on the Draft Environmental Impact Statement Segment A

As a resident of North Seattle, I wish to comment on the Segment A alternatives.

I-308-001 One of the perks of living in the Northwest is the overall beauty of our environment almost anywhere you travel in our region. This includes our section of the I-5 corridor winding past the 145th St. crossing, which captures a majestic view of Mt. Rainier while traveling southbound from 175th. As one example, I believe that any extended elevated system would be an unnecessary eyesore to the region. Besides the visual distraction as a driver, an elevated system needlessly adds clutter to the scenery we so enjoy on a daily basis.

I-308-002 Regarding station locations, the already heavily used overpasses of 130th and 145th would be better suited. It appears unnecessary to push traffic into a residential area for a 155th station when the others are clear choices with a predefined neighborhood identity for heavy traffic.

I-308-003 Further it seems more cost effective to limit the amount of elevated train as well as the construction of stops/stations. Since 130th and 145th will likely need to have changes made anyway, it makes sense to use those locations as stations instead of 155th.

I-308-004 Given these considerations, I urge you to choose A10 as your alternative. Maximizing the use of at-grade tracks and construction at 130th & 145th streets for new stations.

Thank you,
Danielle Loeding
13726 23rd Pl. NE
Seattle, WA 98125

1

I-308-001
Your comment about the potential visual quality impacts of the project is noted. The visual quality analysis is found in Section 4.5 of the Final EIS.

The Final EIS analysis concluded that an elevated guideway, NE 145th Street Station, and parking garage would not block views of Mount Rainier from I-5 southbound; see Table 4.5-1, Viewpoint 3.

I-308-002
Your preference for a light rail transit station at either NE 130th Street or NE 145th Street, and not one at NE 155th Street is noted. Construction and operation of the light rail transit stations would alter vehicular travel patterns on surrounding local arterial streets in all station areas. Chapter 3 of the Final EIS discuss impacts on the transportation network, and Section 3.6 lists potential mitigation measures to mitigate impacts that result from a new transit station.

I-308-003
Sound Transit selected Alternative A1, with some modifications, as part of the Preferred Alternative, which includes a station at NE 145th Street.

I-308-004
Thank you for your comment stating your preference for Alternative A10.

I-309-001

The Seattle Latvian Center & Church is the epicenter of Latvian society on the West Coast. A multitude of organizations, celebrations and community organized events. At this point in time, the Latvians are in a loose-loose situation. This center was customized for the needs of our community hand built & funded by its members. Unfortunetly, they did such a good job at building it that it is irreplaceable. Impact will not be only environmental, but it will deal a blow to our Baltic community. Please be considerate before acting.

SOUNDTRANSIT RIDE THE WAVE

Sound Transit

I-310-001

This commentary is in response to the Draft EIS for the Lynwood Link Extension. The development of this extension as currently planned may cause loss of access or a complete loss of the Latvian Lutheran Church located at 11710 – 3rd Avenue NE on Seattle. Simply put, loss of access or otherwise negative impacts on the church will do great harm to the Baltic community across the Pacific Northwest.

I was married in the church in 1991, and moved around continuously for the next 10 years due to my military career. I returned to the Pacific Northwest in 2000. While deployed overseas in support of combat operations in 2001 -2002 , I often thought of the rich social , cultural and spiritual life of the Seattle Baltic Community, and how it helped me stay positive and kept my faith strong.

Since my return , I have continued to be active in the Baltic community, attending church and being part of the rich multi-cultural group that uses the facility for spiritual and social events and the arts. I come from Northern Kitsap county to attend events at the Latvian center, as do many others. Individuals and families come from as far away as Vancouver British Columbia and Portland, Oregon to do the same. It is absolutely worth it to us to be part of this community. My children attended (and completed) Latvian Language School as part of their upbringing, and it has added tremendously to their bilingual skills and understanding of the world. They know attend events there on their own and consider their heritage and membership in the community a source of pride. I hope that they will have a place to offer their children the same opportunities. I'm sure many parents of Lithuanian and Estonian heritage wish the same for their children as well.

Importantly , this is not the first time this community has been asked to leave their premises, having been forced out before to make room for development in Wallingford in 1969. It took years to rebuild the facility, and generations to rebuild the connections across several communities. ANY loss of access, excessive noise or otherwise negative impacts due to construction or sound transit operations would have a very negative effect on this complex and rich fabric of people's lives. We can't rebuild this all again.

In closing, I am NOT against sound transit and light rail. However, a sustainable and acceptable development solution must be identified , and it must accommodate the Latvian Center and the Baltic Community.

Sincerely,

Arnie Lusis CDR USN (ret)

24665 Hillbend Lane NE Kingston, WA 98346 mob :360.621.0326 alusmuca@centurytel.net

I-310-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describing the refined alternatives for Segment A; Section 4.1 describing the acquisition impacts; Section 4.4 describing impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including portions of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Subject: Concern over impact on Latvian Center

I-311-001

I support the Sound Transit Light Rail Line project. However, I have serious concerned as to the impact this project may have on the Latvian Center in Northgate. The cultural and social significance of this hall to the Baltic-American people in the Northwest is clear. However, I wish to point out the historical significance the center had in the struggle for Baltic independence during 1990-91. I was Treasurer of the Seattle Chapter of the Lithuanian-American Community at that time, and the Latvian Center served as our command center for communications and political action in support of Lithuania's declaration of independence from the Soviet Union. The Soviets did their utmost to shut off communication, but a grass-roots network sprang up world-wide, and the Latvian Center served as Lithuania's bull horn in this part of the US.

The incredible events that took place in 1991 directly impacted many Northwest residents, including the families of some twenty exchange students who were studying in Lithuania's Capitol when the "Singing Revolution" was fought – and won. For these families, the Latvian Center was much more than a meeting hall. It was their candle in the darkness where they could find out about the unfolding events and, most importantly, the status of their children.

For those who may not be aware, here is a short synopsis of these events (from Wikipedia):

> On March 15, the Soviet Union demanded revocation of the independence and began employing political and economic sanctions against Lithuania. Soviet military was used to seize a few public buildings, but violence was largely contained until January 1991. During the January Events, the Soviet authorities attempted to overthrow the elected government by sponsoring the so-called National Salvation Committee. The Soviets forcibly took over the Vilnius TV Tower, killing 14 unarmed civilians and injuring 700. During this assault the only means of contact to the outside world available was an amateur radio station set up in the Lithuanian Parliament building by Tadas Vyšniauskas whose call sign was LY2BAW. Their initial cries for help were received by an American amateur radio operator with the call sign N9RD in Indiana, USA. N9RD and later other radio operators from around the world were able to relay situational updates to relevant authorities until official State Department personnel were able to go on-air. Moscow failed to act further to crush the Lithuanian independence movement and the Lithuanian government continued to work.
>
> During the national referendum on February 9, 1991, more than 90% of those who took part in the voting (76% of all eligible voters) voted in favor of an independent, democratic Lithuania. During the August Coup in Moscow, Soviet military troops took over several communications and other government facilities in Vilnius and other cities, but returned to their barracks when the coup failed. The Lithuanian government banned the Communist Party and ordered confiscation of its property. Following the failed coup, Lithuania received widespread international recognition and was ***Admitted to the United Nations on September 17, 1991!!***

Those of us who lived through these times, who did what we could to get the word out to the world, will always remember the many meetings and press conferences we held at the Latvian Center, and all the Senators, Congressmen, the President of Lithuania, and numerous other dignateries who spoke there. We had a place, our place, a safe place made possible by a country that embraced us as refugees and which never recognized the illegal occupation of the Baltics. I ask – I beg of you – to allow our place to remain.

I-311-001

Thank you for describing the cultural importance of the Latvian Evangelical Lutheran Church.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Light rail and the Latvian Center

I-312-001

I'm an active member of the Lithuanian community. Our organization, the Lithuanian-American Community, uses the Latvian Center many times during the year. Members and visitors come from the Seattle area, from other regions of America and even from Lithuania. The possible loss of the Center due to the coming rail line would make a huge cultural impact beyond words.

The Center is the focal point of the activities of Latvians, Lithuanians and Estonians. It hums with weddings, baptisms, memorial services, concerts, fundraisers, dance groups, choirs, rummage sales, bazaars, Saturday school, parties and a host of other events. It functions to keep our cultures alive and vibrant.

We all consider it "home." Closing "our home" for construction and perhaps rendering it unusable after construction is complete would break our hearts.

I trust you will find ways to mitigate the impact of the rail line and keep the Center open during construction. Most importantly, leave us with a Center that has approximately the same amount of parking, a caretaker's house, and new access if necessary.

Respectfully,
Donna Miksys

Subject: Latvian. Center- Seattle

I-313-001

I am shocked at the possible loss of the Seattle Latvian Center. It is a gorgeous establishment built by immigrants and children of immigrants who have suffered deeply if not physically then emotionally from the upheavals of Soviet oppresion. A center like this has been a boon to cultural cohesion and solidarity.

The Center has bolstered religious, cultural needs as well as research in science and the humanities in conjunction with UW gem of a dept. in Baltic studies.

As a frequent visitors from Edmonton, Alberta, Canada, I truly hope this meaningful piece of real estate survives urban development.

Thank you, Lelde and Karlis Muehlenbachs

Subject: The Latvian Center

September, 2013

I-314-001

I'm writing with reference to the Latvian Cultural Center at NE 117th Street and 3rd Ave NE in the Northgate area.

My name is Ieva Ohaks. I am a second-generation Latvian-American who also has Estonian heritage. Although I was not raised within the Latvian community, I have become interested and involved over the last seven years or so.

In that short period, this is how the Latvian Center has been a part of my own cultural life:

Folk Dance:

I dance with the Latvian Folk Dance troupe *Trejdeksnītis*. This past summer, *Trejdeksnītis* traveled to Latvia to participate in the Latvian National Song and Dance festival. It was an honor to represent Latvian-Americans in this powerful expression of cultural identity. Of course, we perform at events within our own Latvian community as well, and our troupe enriches the cultural life of the greater Seattle area by performing at venues such as the Nordic Heritage Museum, the Seattle Public Library, and Folklife Festival.

We rehearse every week in the Hall/Ballroom at the Latvian center. This is an exceptional space for dance: spacious and with a wonderful floor. On the handful of yearly occasions when the hall is not available, and we have to scrounge other locations, it is always a challenge to work with smaller spaces and problematic floors. I am always grateful to return to our own space.

Ethnic Costume Study:

In addition to dancing, I am a student of folk costume. Several members of the community get together at the Latvian Center to practice traditional and more contemporary embroidery techniques, and I have been privileged to draw on them as a resource in constructing my own folk costumes.

Collaboration with the University of Washington:

The Latvian Center is also integrally connected to the The University of Washington's Baltic Studies program. Students come from all over to study the history, culture, and unique politics of the Baltic nations. The University's graduate library hosts a unique collection of Baltic literature.

I-314-001

Thank you for describing the cultural importance of the Latvian Evangelical Lutheran Church. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

I-314-001

This program is closely linked with the Latvian community, which, along with the other Baltic-American communities (Lithuanian and Estonian) have advocated, raised funds, and provided community support. Visiting scholars and professors frequently present the fruits of their labors at the Latvian Center. The Latvian Center hosts an annual fund raising event, created by the combined Baltic communities, to benefit the Baltic Studies program. The participation and support of our ethnic communities draws scholars to the program and connects the program to the broader culture of the region.

Not only does the Baltic Studies program draw typically college-age students to the Seattle Area, but also older adult community members attend classes as continuing education students. I myself attended Latvian language classes at the University, and I hope to study Estonian as well in the near future.

Pan-Baltic Communities:

The Latvian Center is the only dedicated cultural center in Washington State for any of the three Baltic communities. I have been a singer in the Estonian Choral group, performing for Estonian events such as the celebration of Estonia's independence every February. All three communities have been joining forces for commemorations and celebrations with increasing frequency in the past few years—for example an annual commemoration of mass deportations from all three nations during the most oppressive times of Soviet occupation.

What happens next?

I see that I have painted a picture of a vibrant, active ethnic community. But this is not the whole picture. We are also a community in a fragile point of transition. Our First generation and the older members of our Second generation are aging and are perhaps ready to pass the baton of community duties to the next generations. The young adult generation are just beginning to take on some of the projects that keep the center and the community going. The youngest children are just beginning Latvian School, where they will learn Latvian language and culture and form friendships that will sustain the community into their adulthood.

Also, the growing spirit of collaboration among Baltic-American communities is bringing an essential boost in energy and ideas.

However, if the use of the Latvian Center were disrupted, these positive shifts could easily lose momentum. All of us, with so many other demands on our time, may form other habits, take up other

I-314-001 hobbies, and all the dynamic potential of these developments could simply dissipate. Once cultural heritage fades, it is very difficult to revive.

In summation:

The Latvian Center is a precious resource in the cultural life of our region. Its facilities and its accessibility to the interconnected communities it serves are a vital part of our cultural life. We add regional and international prestige to the City of Seattle, to King County and to the State of Washington. So far, I have been pleased that Sound Transit has taken our concerns seriously and expressed respect and support. Please continue that trend, turn the words into action, and help us keep our center functioning during and beyond the disruptions which the Light Rail project will impose.

Sincerely,

Ieva Ohaks

Comments

How I have used the Latvian Center over my lifetime:

* Baptism, Confirmation, Marriage in this church
* Not only did my parents meet through the dance group, but all 4 children in my family have danced with and traveled internationally with this group. To this day, the Latvian dance group remains the main draw for Latvian youth and remains the glue that keeps us all involved and a living community.
* How can the language survive if the children don't come to Latvian school? We have never asked to have special allowances or to have a "press 3 for Latvian" accomodation. We are all not only LV community members, but also many are successful members who have given a great deal to our American society.
* I have lived parrallel lives and this center is my home. I cannot imagine my son not having the same home for his lifetime.

Growing up with no feeling of belonging, community, or culture, then having married a Latvian American I feel fortunate to have become involved in this one-of-a-kind of community. There is no other place like it in all of the Northwest and to displace this huge, vital hub of not only Latvian Americans, but Estonian Americans, and Lithuanian Americans would endager our culture which we have not assurance would survive. We need our home, we have worked for it, maintained it, and deserve to pass it onto our children.

SOUNDTRANSIT
RIDE THE WAVE

I-316-001

Thank you for your comments describing the cultural importance of the Latvian Evangelical Lutheran Church to you and your family.

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Dear Sound Transit Board members,

Hello. I am very excited for the light rail system and the ability to walk to a light rail station from my house. I do have legitimate concerns over the Shoreline City Council's recommendation for the light rail station and parking structure to be placed at 145th St. (SR-523) and I-5. The Shoreline City Council is not discussing the reality of the conditions of traffic on 145th Street, or the 130th/155th St. options with WSDOT, Sound Transit, or the community.

I-317-001

The intersection where it would be placed (145th St. NE and I-5) is already a highly congested area. According to WSDOT, the intersection and the stretch of NE 145th St. surrounding it is already, in their words, over-capacity. Adding another destination focal point can only cause more congestion.

There are a couple of contributing factors to this, including, but not limited to: * It is the only complete set of I-5 on and off-ramps between Northgate and 175th St. NE. * There is minimal queuing area for the cars to enter the I-5 on-ramps. Which creates backups on 145th St. east and west of the intersection and in-between on the overpass bridge. This, in turn, creates backups on the I-5 off-ramps. * It is a main arterial to I-5, that receives the bulk auto traffic not only from Shoreline neighborhoods, but also from Haller Lake, Greenwood, Aurora, Lake City,Bothell, Woodinville, Pinehurst, Lake Forest Park, Kenmore, and east-side traffic. * According to WSDOT, traffic increased 11-15% on NE 145th St./SR-523 after the 520 bridge was tolled and people started using it as the connector around the north-side of the lake to I-5.

Currently, 145th St. east and west of the I-5 intersection during morning and evening rush-hour has two-lane 1/4 to 1/2 mile backups of cars waiting to go northbound and southbound onto I-5. One of the major problems is there is no good way to mitigate the issues of a light rail station on 145th. Some of the ideas floated are: * Add complete sets of off and on-ramps at 130th and 155th St, to reduce the influx of vehicles that use 145th. St solely for the purpose of I-5 access. (which WSDOT says it will not do) * Acquire hundreds of folks properties to widen the 145th arterial, in some instances this would place a state highway within feet of Seattle and Shoreline folks' front doors, or directly in the path of current homes. There is also current infrastructure and or protected spaces in the immediate vicinity, such as a pumping station, Thornton Creek, and the Jackson Park Golf Course. * Add direct on and off-ramps to the station and parking structures from I-5.

When I asked the Shoreline City Council how they plan to address this, or if they have worked with WSDOT to address these concerns, I receive blank stares and replies along the lines of "WSDOT will mitigate any issues". When I asked WSDOT if they had an official position, they said they had not released one but would be more than happy to talk to Sound Transit about the facts. I encourage you to speak to the WSDOT planners and employees who control this area.

I-317-002

I have been to multiple Ridgecrest community meetings, and to the majority of the folks in the effected neighborhoods it makes much more sense to have the proposed two stations at 130th St. and 155th St. Some contributing factors supporting this are: * The already over-capacity and congested NE 145th St. arterial. * 130th is an arterial from Greenwood/99 to Lake City, but currently does not have the congested traffic that 145th St. does. *155th is an arterial from Greenwood (via turning into Westminster Way, which turns into Greenwood), Aurora/99, to 15th Ave. NE * The more stations a mass-transit system has, the more people will have access to it, and more people will use it. The two stations, 130th and 155th St. would server a greater amount of citizens and provide access to more light-rail riders. * Two stations will split the traffic, and if applicable, the parking between two stations. * It will allow people to access the stations from 130th (125th&Roosevelt&130th), 145th, and 155th (All of which are East/West arterials). * 155th St. and 130th St. both have designated bike lines. 145th Street does not have a bike line, and is not safe for bicycle traffic. * 155th St. and 130th St. both have newer accessible sidewalks. The 145th St. and I-5 intersection is not very walkable, nor accessible. The sidewalks, where they exist, are not accessible. * It creates easy light-rail access not only for the Ridgecrest and Parkwood neighborhoods, but also for Lake City, Pinehurst, Bitter Lake, Haller

I-317-001

Your concerns about traffic congestion at NE 145th Street and I-5 are noted. In the Final EIS, Sound Transit proposes mitigation to address impacts from the light rail project along NE 145th Street, see Table 3-27 in Chapter 3, Transportation.

I-317-002

Your preference for stations at NE 130th and NE 155th Streets is noted.

The Preferred Alternative evaluated in the Final EIS includes stations at NE 145th and NE 185th Streets. Ridership analysis shows that there would not be large differences in ridership among the alternatives, despite the different station locations; see Section 3.2.2 in the Final EIS for this discussion.

Chapter 3 has further detail for bike/pedestrian ridership and traffic in general. Chapter 2 describes the sidewalk, bike, and other access improvements associated with the Preferred Alternative.

I-317-002

Lake, Olympic Hills,and Broadview. * This will free up the East/West arterials for the crosstown bus routes to feed the stations. * Less, if any at all property and homes would need to be acquired. The property around the proposed 130th St. and 155th. St. stations are owned by the municipalities.

If you can, please visit and observe the congested NE 145th St. and I-5 intersection during morning or even rush hour. You will see how wanting to place a light rail station at 145th St. is very troubling.

Thank you for your time.

Subject: Draft DEIS Comments

To Whom it May Concern:

I-318-001

I am writing today to express my thoughts, comments and concerns over the planned light rail extension to Lynnwood. Specifically in regards to how the project is going to impact the Latvian Lutheran Evangelical Church and Community Center located at 11710 3rd Avenue NE, Seattle 98125.

The proposed plans for the rail extension to Lynnwood call to highly impact the Latvian Community Center - and in one plan, to completely get rid of the center.

I am not of Latvian descent, but my husband is Latvian and I married in to this wonderful community. My husband is the second generation of his family to be born in the United States. His grandparents fled Latvia during World War Two when the Soviet Russia invaded Latvia. His grandparents, after years of moving from place to place in search of a new home, ended up Seattle. They found a new home in Seattle and were also able to find a community of Latvians that ended up there as well. In this new home, they created a community that was strong and proud of their displaced heritage.

They created a community center that was taken away by imminent domain in Wallingford and ended up in their current location. They built this Center from the ground up and it is a hub of Latvian and Baltic activity that thrives on their Latvian culture and community.

The Draft DEIS mentions that this facility is merely a church, but I want to raise attention that it is so much more than that. Over the years that I have known and been married to my Latvian husband, I have been to numerous events at the Center - not only Church events - and am aware of the many activities that this facility serves. As you are now aware from the outcry of the Latvian community, the Center serves as a Latvian Language school, as the facility that holds practices and performance space for the Latvian Folkdance Group and Latvian choirs, a hall for Latvian events and parties, a polling place for Latvian (and Baltic) elections, a Church serving all Baltic communities, as well as a center for the cultural preservation of this strong community.

I am Hawaiian. And one of the things that drew my husband and I together from the start was a love and respect for our cultures. We are both strongly involved in our communities and have gained a strong respect for each other's cultures. I am due to have a girl in October and would love more than anything for her to learn both of her parent's cultures. This Center is vital in allowing that to happen. Just as my husband did, I would expect my daughter and other future children to attend the Latvian School to learn about her ancestors and gain a deeper understanding of her culture.

1

I-318-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

I-318-001

Being a City of Seattle employee in the Cultural Programs office at Seattle Center, I understand how important it is to this great City of Seattle to preserve and promote all of the cultures and heritage that this City represents. We are lucky as residents of Seattle that our Mayor strongly promotes cultural preservation and cultural pride. Taking this facility away would not prove that this is true for the Latvian Community and it would be a sore disappointment to this City.

This Latvian Center is an important part of the Latvian Community and to the City of Seattle as a whole. There is no value that you can put on the Center except to say that it is a priceless piece of Latvian and Seattle history.

Please reconsider your plans and I am hoping that any impact made to the Center will have little effect on this community and all of the activities that take place there. This Center is the heart of this community - let's not take away their hearts.

Thank you for your consideration.

Sincerely,
Angela Petersons

Sound Transit
Draft EIS comments

Fifteen years ago my husband and I moved to Seattle and became active members of the Latvian community. The Latvian Center at 11710 3rd Ave NE, Seattle, WA 98125 is known across the country and the world as a gathering point for Latvians in the greater Seattle area. We knew that we would be welcomed into the community as soon as we stepped foot through those doors.

In those early days, we joined the Seattle Latvian Church, but we quickly began supporting many more activities in the Center. The Latvian School, housed in the Center, taught my daughters about their Latvian heritage and, by extension, the heritage of their Baltic neighbors. My oldest graduated from the school earlier this year, while the younger one joyfully spends Saturdays at the Center with her peers. Trejdeksnitis folk dance performances are particular draws and our daughters are waiting for the days they are old enough to dance with the group. The candlelight service and following Christmas pageant every December is one of the biggest draws for the cross-generational community. Children perform songs during the church service and again in the pageant. The wonder and joy in the eyes of the children when Santa comes ho-ho-ho-ing into the main hall is something that lights up everyone's spirit.

I-319-001 The proposed extension and alignment onto the Center property of the Sound Transit Link Light Rail and the physical disruption to the property will cause irreparable damage to the communities and organizations using the property and unfortunately, will discourage new members from joining the communities due to the uncertain future that this situation presents. The Baltic communities that call this property home are fragile communities that can not afford this sort of disruption.

Link Light Rail is a project that should support the communities of Seattle, not threaten their existence.

Sincerely,
Linda Beinikis

1

I-319-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

Draft EIS Comments
Lauren Swift

I-320-001

We are members of the Latvian community recently relocated to Seattle and are extremely concerned that the Lynnwood Link Extension will destroy the long established Latvian Cultural Center and Church in Seattle. While living elsewhere, over a time period of at least 40 years, we often drove to the Latvian Cultural Center to enjoy and take part in the various activities it had to offer. The location near I-5 is ideal for anybody driving from a different city,
therefore, in our opinion, relocation is out of the question.

Please consider the interests of a large Latvian community and save the existing Latvian Cultural Center and Church by:

1. Ensuring uninterrupted access
2. Building the Light Rail on ground level with a wall seperating the Latvian Cultural Center from the Light Rail trains (or better still - put it underground
3. Making permanent access and parking possible (maybe at the end of 20th St. - would mean purchasing the last house on the street for a driveway)
4. Rebuilding the Latvian Cultural Center's caretaker's house

Yoiurs truly,
Juris Beitlers & Olga Grikis

1

I-320-001

The Preferred Alternative evaluated in the Final EIS includes several of your design suggestions, except for the underground option. Such an option would not avoid the displacement, and would not connect effectively to the guideway sections to the south where an elevated alignment is the least impacting choice. The Preferred Alternative redesigns the church access street to the south, replaces a city street, which allows for replacement of lost parking, and includes land that could accommodate a relocated caretaker residence. Chapter 2 of the Final EIS describes the Preferred Alternative.

I-321-001

The Seattle Latvian Community Center and Church have been a source of cultural promotion of the Baltic countries and Latvia and its traditions and community specifically over the last sixty and more years since the arrival of their displaced persons in the fifties. Sharing with the greater Seattle community, the West Coast and USA in general as well as visitations from other countries, based out of this facility, we have participated and shared our culture at the Goodwill Games, with Latvian West Coast Song Festivals which took place at the Seattle Opera House, The Sheraton and other local hotels for thousands of attendees; participation in Folklife for over 20 years now with the folk dance Group Trejdeksnitis, and young women's singing ensemble Sigulda, as well as Bumpershoot with Latvian artists participating, not to mention parades and supporting the University of Washington's Scandinavian Department, Baltic Studies Program with annual traditional "kekatas" evenings and other fund raising efforts in form of auction and donations, dance song and other contributions; and many art and cultural exhibits at the Nordic Heritage Museum, and Tacoma's art exhibitions of local culture with sewing, weaving crafts and art presentations. Governor Gary Lock acknowledged these contributions to an exceptional person of the local Latvian community, Mrs. Skaidrite Abolins with special award for her contributions to our state; several other local Latvians were invited and participated with Latvian weaving and other traditional demonstrations in Washington DC during the 200 year bicentennial activities there.

For several years now, the Latvian dance group Trejdeksnitis also participates in the annual culture awareness events at the Seattle Art Museum, as did our younger generation in years past at the Seattle Museum of History and Industry during their annual Christmas holiday cultural exhibitions; and local young athletics oriented latvians participated in Olympic trials in Shoreline. Having settled near the previous Latvian Community Center which at that time was near Lincoln High School, the Latvian students at Lincoln shared their culture through the then active International Club.

I-321-001

Currently the Seattle Latvian Community Center and Church is the center for visits from Latvian presidents. The current President Andris Berzins is visiting September 22, 2013 and past President Valdis Zatlers who also was guest speaker at the Seattle World Affairs Council. Art exhibits at the Latvian Community Center have been open to the public, as well as visitations from Latvia by actors, musical artists with voice and instruments and other exchange programs between the USA and Latvia. The national American Latvian Association meetings have been held in Seattle representing issues pertaining to Latvians in Latvia as well as outside Latvia, giving both opportunities to learn about their respective cultures and share the best of each, providing the displaced persons outside of Latvia and as well as Lithuania and Estonia and their families a closeness to their heritage and roots so they can be more fulfilled citizens of this country.

I-321-002

The community of Seattle will lose a lot of these contributions for the mere reason that such exciting activities need a central known source and place to practice, gather for inspiration, and learning and coordination of same. Currently, the Latvian Holiday Bazaar each November as well as the Rummage Sale in the spring have been an expected and well anticipated and received activity for the local Seattle community in general. A very sad result of displacement of this community will be the loss of its offerings to the elder population and the families who have bought homes and made their lives to enable their connection and participation to this part of their heritage. The most loyal and now oldest member lives in her home two blocks away from the center which she and her husband purchased when the Center was built in 1972. She would rarely be able to partake of this cherished part of her life to which she has given so much if the current facility would have to be removed or displaced.

Thank you for providing us the opportunities to state our concerns and describe the contributions and sacrifices this community has made to enable this facility to be built and develop in such a fruitful part of this City and State.

Subject: Public Comment - Lynwood Link Extension & Latvian Church & Center

Dear Sound Transit:

I would like to this opportunity to comment on the Draft Environmental Impact Statement (DEIS) for the Lynwood Link Extension.

I-322-001

As the DEIS points out, the extension may adversely affect the Latvian Church and Center (LCC). I encourage you to do everything possible to minimize the impact on the LCC.

I am Latvian and part of much larger Latvian diaspora. After World War II, my parents along with 40,000 other Latvians immigrated to the United States with the help of the U.S. government and various social service and religious organizations.

Many of those Latvians settled in Seattle and banded together to built the Latvian Church and Community Center. Since then, the LCC has been the nexus for Latvian social events, school, choirs, dance groups, theater troupes, veterans' groups, and political organizations.

I am now parent with two children, 4 and 6, who has enrolled them in the Seattle Latvian School. Without the LCC, my children and I will loose a valuable resource to learn the Latvian language; culture, traditions and most importantly build enduring ties with other Latvians.

The Lynwood Link will not only affect the Latvian School but it will also adversely affect other local and regional groups that rely on the LCC which include:

- LATVIAN ASSOCIATION OF THE STATE OF WASHINGTON
- LATVIAN ARCHIVES & LIBRARY
- WEST COAST LATVIAN EDUCATIONAL CENTER
- UNIVERSITY OF WASHINGTON BALTIC STUDIES PROGRAM
- TREJDEKSNĪTIS, LATVIAN FOLK DANCING GROUP
- SEATTLE LATVIAN EV. LUTHERAN CHURCH
- LATVIAN EDUCATIONAL CENTER
- LOCAL ESTONIAN AND LITHUANIAN COMMUNITIES

1

I-322-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

I-322-001 As you draft the final environmental impact statement, I encourage you to consider the impact of the Lynwood Link on an important local and regional cultural center. It is unacceptable to close the LCC for any length of time. Doing so would negatively adversely impact the local, regional and even the global Latvian community.

Sincerely,

Eriks Sasha Paegle

I-323-001

As a twenty-four year old young man, the MOST important part of my social and cultural life revolves around the Latvian center. I arrived in Seattle two years ago fresh out of college and was immediately taken in by the Latvian dance group Trejdeksnis. Soon after, I started coming to choir, church, teaching in the Sunday school for young children to pass on this wonderful culture and language and much, much more! Without exaggeration I come to the Latvian center on average nearly twice per week. The center, even for a young twenty-four year old like myself, along with many other young people like me is an irreplaceably important place

I have been a member of the Seattle Latvian Community for 50 years. My whole family donated money and actually helped to build the center after the Latvians lost their previous one to City of Seattle

I-327-001

While I agree we need a relief for the traffic congestion, I am very, very saddened about the Links impact on our property - church - community hall. It has been like my second home, my social & cultural center. I dread losing it. Without it (I am a senior citizen now) I would have no social life and miss my ethnic activity which are very very important to me. Television can't replace these things. I beg you to consider & find another solution. Sincerely, Lilija Sankalis.

P.S. The Canterbury location is ideal - I-5 for mostly in my case - Highway 99

I am writing to state that eliminating the Seattle Latvian Church and Center is completely unacceptable. This center has played a critical role in my family's history and is an important component of our future and heritage as well. My grandpa helped build the center, my parents and other relatives were married there, my 3 siblings and I went to school there, were confirmed in the church and attended over a hundred functions and gatherings throughout my childhood and college years. While I may no longer live in WA, the times I do return I will still find myself at the center and have looked forward to bringing my kids there as they get older. Eliminating this critical and historic gathering place would be a true tragedy

Sincerely, Laura Schott

Dear Sound Transit Planners
c/o Lauren Swift,

I-330-001

Having weighed all the options C1, C2, and C3 very very carefully, I want you to know that I evaluate that Option C3 for siting is the only option that makes sense for our community and for the South Snohomish region.

To try to site the route and stations along 52nd Ave W. (options C1 and C2) would have the effect of destabilizing and brutally "big city industrializing" of our fragile-enough neighborhoods which are trying so hard to build up our sense of neighborhood closeness and cohesion here in Lynnwood. We don't need trains, running through the delicate eco-system and nearby streets of what we all enjoy as Scriber Lake's legally protected wetlands park, either!

Option C3 is different in a positive way. It makes sense for consolidating and preserving a transit corridor we are already used to for Lynnwood. I believe it would indeed also be the best revenue-producing alternative for Lynnwood businesses, as many riders would jump at the chance to find the safe harbor of hotels, restaurants, and retail options so close to their train journey's end.

Please choose Option C3 as the sole alternative that is best thought-out as benefitting riders, business, and residents of South Snohomish County. Thank you.

Sincerely,
Elaine Smith
Elaine Smith

I-330-001

Your preference for Alternative C3 is noted. The Preferred Alternative evaluated in the Final EIS includes a modified Alternative C3. Chapter 2 in the Final EIS describes the Preferred Alternative.

Subject: Latvian Church and Hall

Dear Sound Transit Officials:

I-331-001 We have heard that the Latvian Church/Hall is in jeopardy of being demolished in favor of rapid transit using this corridor to pass from Seattle to Lynnwood.

This beautiful structure serves not only the Latvian community but also the Estonian community, which is quite small in Seattle, not large enough to support a church and hall of its own.

Estonians of Seattle are dependent upon the church and hall for their religious services, civic programs and festive events. It would be a very sad day if the church/hall is demolished to allow Sound transit to travel along I-5.

With today's prices it would be impossible for the Latvian community to replace this outstanding and most useful building. Both Latvians and Estonians would be robbed of the many events that are held there throughout the year.

Please find an alternate route for Sound transit rather than destroying the possibility of Latvians and Estonians coming together for church services, civic and social events.

Sincerely,

Ruth A. St.Hilaire
(of the Estonian Community)
Seattle WA
206-282-2812

I-331-001

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Save the Latvian Lutheran Church

Hello,

I-332-001

I am writing as an alumnus of University of Washington's Scandinavian Studies department. I graduated cum laude in 2011 and my senior thesis was a way to test Latvian language acquisition. UW has close ties to Latvia and its culture; the UW Chorale has even traveled there twice: once to perform for the president of Latvia and then to participate in the Song and Dance Festival in Riga (an *inexplicably* powerful cultural event that brings non-Latvians like me and my fellow students to tears).

To complete my program, I had to learn Latvian language, culture, and history. The Latvian Lutheran Church was tantamount to my successful completion of the degree.

I have taken part in events at the Church since 2007: events including the St. Martin's Day festival, the dance group (which recently traveled to Latvia's Song and Dance Festival in Riga), and other local events at the Latvian Lutheran Church.

Seattle would not be the same without this Church. It is the only one of its kind and people travel from all over Western Washington to connect with their culture there. This is a way for people who are far away from their family's country to connect and strengthen their social bonds.

I believe that you can find a way to complete the necessary business for Sound Transit without harming this pocket of Latvian culture.

Thank you for your consideration.

Subject: Sound Transit's impact on the Latvian Center

Dear Sound Transit,

I-333-001 I am a member of the Seattle Lithuanian-American Community. The Latvian Center is the venue for most of our events from Lithuanian Independence Day on Feb. 16, to the Commemoration of the Day of Deportation in June, to the one of the most important celebrations for Lithuanians, **Kūčios** (Christmas Eve), and I am concerned that the proposed light rail line may have very severe impact on the Center.

We have held many benefits at the Latvian Center as well. In fact, you should attend the St. Martin's Day festival on Oct. 26 at the Latvian Center to witness one of our events in person! It's a fundraiser for the Baltic Studies Program at the University of Washington - $25 per person and includes dinner. There's a silent auction too. It starts at 6 p.m.

I am asking that you please keep at-grade access (not the elevated option) to the Latvian Center open during construction and to minimize the impacts during construction and after (dust, noise, vibration, light, etc.) so they don't hamper our events.

After construction is complete, please do not take the property and relocate the Latvian Center. Instead, find ways to keep it in its current location, and offer adequate parking and access.

thank you,
Anne Totoraitis

1

I-333-001

Thank you for your comments about the events held at the Latvian Center. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Several sections in the Final EIS have been updated to address these changes: Section 2.5.1 describes the Preferred Alternative and the refinements in other alternatives for Segment A; Section 4.1 describes the acquisition impacts; Section 4.4 describes impacts to community facilities and neighborhoods. In addition, Appendix F presents revised conceptual engineering plans for the refined Segment A alternatives; Appendix I-4.1 contains detailed maps and tables concerning acquisition, displacement, and relocation requirements for each Segment A alternative, and Appendix G has visual simulations.

As noted in Section 4.1, any acquisition of property, including a portion of a property, would require fair compensation to the property owner in accordance with Sound Transit policy and federal and state law.

I-334-001

IF OUR LATVIAN LUTHERAN CHURCH IS LOST TO THE LYNNWOOD LINK EXTENSION IT WOULD BE A SEVERE HARDSHIP FOR ME AS I WOULD BE UNABLE TO GET AROUND AS MUCH AS I GET OLDER.

ALSO RELOCATING AND/OR REBUILDING A NEW COMMUNITY CENTER AND CHURCH WOULD BE A TREMENDOUSLY DIFFICULT PROJECT FOR THE COMMUNITY AS A WHOLE, GIVEN THE AGING NATURE OF OUR COMMUNITY.

Dear Lynnwood Link:

I-335-001 I wish to voice my support for Segment B2A, that provides a stop at 220th St SW in Mountlake Terrace.

Anticipating area population increases and existing large employers and service-providers in the 220th St SW corridor of Mountlake Terrace leading to Edmonds, this stop will be an important connection to Community Transit to make connection to Swedish Hospital Edmonds, Premera/Blue Cross, businesses and many multi-residential apartments in the area.

I-335-002 Currently, Melody Hill Elementary has been demolished and there is land available through Edmonds School District on the west side of I5, south of 220th.

Thanks,
John Westfall, Brier, WA

1

I-335-001

Thank you for stating your preference for Alternative B2A with a proposed light rail transit station at 220th Street SW.

I-335-002

Sound Transit learned of the demolition of the Melody Hill Elementary School building owned by the Edmonds School District after the publication of the Draft EIS. The Final EIS has been revised to accommodate this change. A station at 220th Street SW utilizing this property is evaluated as an optional station location for the Preferred Alternative in the Final EIS.

I-336-001

For the past 41 years we have been coming to the Latvian Center to participate, enjoy, share with other Latvians at our center and church. The Seattle Latvian Folk Dance Group practice weekly and perform several times a year for their own fulfilment and enjoyment for this community. Without the center this would be hard to do.

Latvian Americans have strong ethnic ties to each other, and need access to the center for cultural events, for the nourishment of our souls.

September 17, 2013

Subject: Lynnwood Link Extension Draft Environmental Impact Statement - Impact to the Seattle Latvian Church and Center at 11710 3rd Ave N.E, Seattle, WA 98125

Dear Sound Transit Board,

I-338-001 Today I am writing to share my concern about the future of the Latvian Church and Community Center.

I attended the Latvian school at this center and graduated in 1980, I can still speak, read and write in Latvian. In the class room area of this center there are photos on display, still today, of students with high scores on exams administered nationally by the American Latvian Association. I managed to get an honorable mention and thus a photo of me is up on the wall with the others for my 7 year old daughter to see. Last Saturday my daughter, started her 4th year in this school in the very same building. I hope that when my daughter gets older she will join the dance group Trejdeksnitis and eventually travel to Latvia to participate in a song festival as others did earlier this year.

Latvian families like my parents came to America after World War II to make a better life for their families. Even while in Displaced Persons Camps in Germany after the war they organized schools, theater troupes, music ensembles etc. The sense of community and education was strong and as you have read elsewhere the Northgate location is not this community's first residence. The generation that came to America had an irrepressible goal, to pass their culture and language to their children, thus they built a 2nd church and community center. As such communities assimilate over generations this singular focus gets diluted and the challenges of financing, designing and building a 3rd community center becomes insurmountable. If we loose access and have to relocate this physical anchor which sustains our regions Baltic communities will disappear. The language and culture continues because we have a physical location to carry on.

Please help the Latvian Church and Community Center stay whole and unaltered in its present location.

Thank you for your time and consideration.

Eriks Rauda

To: Lynnwood Link DEIS
Subject: Latvian Community Center and Church

To Whom it May Concern,

My name is Liz Rekevics (Elizabete Alma Astra Rekevics in full), and I'm Latvian.

My parents immigrated to the US during WWII and made their home here in Seattle where I was born and raised. The Latvian Center, exists and was built for my generation and those to come. I attended Latvian school there, numerous church/community events, was confirmed there – and bid my grandparents and both my parents farewell at the Latvian house.

I-339-001

I currently see a full capacity school, an active church community, frequent use by all age groups and Baltic groups. Compared to any other stop along your path to Lynwood, I don't see any other community so drastically affected by your plans. You wouldn't dare blast through any one of the many silly chain restaurants at Northgate, why is a hub of an entire community any less valuable? How many other community centers are you considering dissolving along the way?

Relocation, not an option. Families have intentionally moved to the area to be closer to our center. This is where we continue our existence. We bought the land, we should get to use it.

You've seen our access point – it's not significant, but does the trick. The VERY least you could do is to allow us to KEEP an access point. You will already change our entire experience with noise, view etc – but let us GET WHERE WE NEED TO BE! My suggestion is to provide an alternate access point off of 5th. There are a number of homes which I'm sure will be running for the hills the moment they realize the train is coming through their back yard. I'm sure there are options available. But blocking us out, or taking it away is simply NOT AN OPTION.

Please consider your path wisely. I understand the need for light rail, but wrecking an entire community that has worked so long and hard to create such an important place, is not necessary. This is far more than a community center. This is a home base to so many who have been uprooted many times.

Thank you

Liz Rekevics

Subject: Concerns about Sound Transit and the Latvian Center

Dear Lauren Swift,

I-340-001 I am writing in response to the Lynnwood Sound Transit DEIS. As a Latvian American with strong ties to the Seattle Latvian Center, I am concerned about the possible adverse side effects of of the proposed light rail construction.

Being involved with the Latvian Center these past 12 years, I have found community through dancing and performing with the internationally recognized folk dance group, Tredeksnitis. Discovering the Latvian Center here also connected me to the Latvian language, which I wasn't raised speaking (in large part because there was no Latvian Center near where I grew up). The Latvian Center broadened my awareness of other Latvian educational opportunities in the Northwest, eventually connecting me to the University of Washington's Baltic Studies Program where I was able to continue my study of the language. I will be joining the Latvian choir this fall and look forward to learning more about the Latvian language through this experience.

The Latvian Center is a culturally important gathering place that brings together all ages to celebrate and pass along cultural traditions and values. I believe that the plans to proceed with building the Sound Transit Lynnwood Link line needs to take into account the least disruption to the center possible. I think this could be best done by building the non-elevated line and assuring that access to the center is guaranteed at all times during construction.

I hope in planning this you will be sensitive to the history that so many Latvian elders and their children experienced as displaced persons and refugees during WWII and their subsequent immigration to America. I urge you to consider the significance that the Latvian Center has in Seattle. Unlike other ethnic communities that have multiple gathering places, this is the singular center for the entirety of the Latvian community in Seattle.

Thank you for your consideration and preservation of this gem of a community space, gathering place, church, and educational center.

Sincerely,
Jana Vitols

To: Lynnwood Link DEIS
Subject: Comments on DEIS

A very comprehensive report, and the volume of information is overwhelming for a decision-maker. Some observations and suggestions:

I-341-001
- All of the criteria seem to be presented as equal to one another. For instance, the number of properties expected to be taken by any one option is equated to a ridership estimate. Check the results from Central Link for both of these – and the other elements – and you'll no doubt find that some were more accurate than others. This "certain" information should be a major consideration, as this is *actual* experience, even though it's a different segment with, more than likely, different people making the estimates...but, their methodologies are probably similar. I'm comfortable in my feeling that you'll find that property impacts and capital cost estimates were closer to reality than ridership estimates were for Central Link. A percent accuracy for each element would be useful, so as to not fall into a trap of considering each element is equally accurate, which is what looked to be the case in my reviewing this DEIS.

I-341-002
- "Cheap" shouldn't be the top priority, but perhaps "bang for the buck" should be. I'd rather see 4 stations built well than 5 or 6 stations built bare-bones.

I-341-003
- Spacing of stations should be considered, as well as what that conveys/feels like, i.e., is this a limited-stop transit mode, or more like a bus or streetcar? Additionally, does a station at location "X" give you something valuable enough that otherwise would be lost. I was glad to see that there were estimates for gains and losses associated with each station in the DEIS, as this hasn't been presented verbally, rather, I have only heard of the "ridership" lost, which is misleading, not only for the gray area that ridership estimates tread into, but also for a lack of completeness, because there are a myriad of objective "pros" and "cons" that should all be presented as a table for you to weigh.
- Regarding spacing, on approximately a straight line, the mileages from Northgate Station to: 130th (1.5), 145th (2.3), 155th (2.8). The mileages from 130th to: 145th (0.8), 155th (1.3), 185th (2.8). The mileage from 185th to Mountlake Terrace Transit Center: 3.1, The mileage from Mountlake Terrace Transit Center to: 220th (1.0), Lynnwood Transit Center (2.0). This spacing, along with access considerations/feasibility, suggests that an option that's not listed may be more prudent, stations at 130th and 185th. The ST2 plan defined a "general" scope for the project, voters expect the decision makers to wade through the options, not capitulate to cities' whims (e.g., your board bypassing Southcenter) unless they make sense to the region, with the result not precisely what they saw in the initial materials (e.g., King County Metro's upcoming plan for reductions will differ from what they suggested last spring). It's a fluid process, most voters are smart enough to realize that, and we saw that the "actual" Central Link differed from the initial proposal. Beware of the territoriality of the proponents of various options!!!

I-341-004
- Connections to regional multi-modal transportation systems is a goal. It is instructive as to where we are **today** at each of the proposed station locations, as we are in a financially-challenged environment and are likely to continue to be so; all one has to do is look at the federal debt issue or the state special session issue. As one statement noted, you should seek: "stations that are easily accessible by foot, bike, bus, or car." I'd add: "given the financial environment of **today**." Are sidewalks complete, which the DEIS didn't seem to focus on well, and from which directions from what population would this draw from? Are there bicycle lanes in place, and what is the total population that this may draw from

1

I-341-001
Your comments concerning the presentation of information used to compare project alternatives are noted. The purpose of an EIS is to present potential impacts of a project to the public and decision makers. The various environmental resources are not weighted. The methodologies used to make estimates for project impacts are generally similar to the methodology used for the Central Link environmental review document and both are based on conceptual engineering design.

I-341-002
Sound Transit's objective is to develop a project that best meets the purpose and need for the project, minimizes environmental impacts, and is cost effective.

I-341-003
Your comments on spacing between the proposed light rail transit stations are noted. As a regional facility that is linked with the local transit network, the station spacing reflects a balance between access, travel times, ridership, current land use, and the land use plans of local jurisdictions. The neighborhoods between NE 130th and NE 155th Streets are among the most dense in the corridor, and therefore one station only with a larger gap between the stations would have given fewer people good accessibility to transit (particularly for walk or bike trips). The Draft EIS alternatives also were arranged to allow other combinations of stations, but as the strongest support in public comments and from local jurisdictions was for a NE 145th Station from early scoping through the Draft EIS, a unique alternative featuring a NE 130th and NE 185th combination did not appear necessary.

I-341-004
A detailed inventory of existing pedestrian facilities within 1/2 mile of the stations and existing bicycle facilities within 1 mile of the stations is

I-341-004 (neighborhood streets would have a higher possibility than major arterials)? What transit routes serve that location, particularly all-day service, and how frequent? What are today's traffic volumes on the major approach streets? Hopefully, you've seen this first-hand during peak a.m. and peak p.m. commutes at each prospective station location, knowing that light rail-bound motorists will seek neighborhood cut-throughs where main streets are clogged. What multi-family and business developments are nearby or are proposed for the next 10 years? The certainty favors today's conditions over tomorrow's possibilities under a "if money is no object" perspective that some proponents are using in their attempt to influence you, which is a dangerous assumption to take on.

I-341-005
- It should be considered secondary what is possible in order of cost (weighting each). For instance, are existing roads nearby the proposed locations wide enough **today** where bicycle lanes could be striped, a relatively-inexpensive proposition that has high likelihood of reality, and then what's the feasibility of their widespread use (neighborhood streets would have a higher possibility than major arterials)? The same question for completing sidewalks and widening them, which is more expensive and thus less likely of becoming reality, and should be weighted as such. Three of the overpasses in the study: 130th, 145th, and 185th, have narrow sidewalks, and the first two have heavy vehicular traffic volumes adjacent and harrowing (at best) bicycle conditions that are only for the "professional" bicycle commuter. The same question for widening streets, but here the possibility of securing funding coupled with the dwindling time (less than 10 years) are **huge** impediments, sharply reducing the possibility of this coming to fruition, and mitigation of existing traffic during construction should be a consideration. While I didn't see the volume numbers within the DEIS (it is a huge document), I did see the proof that traffic volume matters within the DEIS, with the highest accident incidents on 145th, then 130th, and none at 185th. Each of these accident numbers would be higher with the addition of a light rail station on those streets.

I-341-006
- It should be considered tertiary if something's been *zoned* for higher density with no developer in the wings, as a development could take years or decades. It should be considered how many quadrants around the stations *could* be developed: all four corners, 3, 2, or only 1. For instance, the 130th location has a park in one quadrant and part of another. The 145th location has a park and a private school in two quadrants. The 155th location has a park in one quadrant. The 185th location has a school district property in one quadrant...though, that quadrant is also a destination of a senior center and stadium.

I-341-007
- It should be considered secondary what bus transit *may* do, as we're talking 10 years from now, and most of the planners making the guesses today will be in different positions or retired by then, while nobody can guess with certainty what the financial situation will be in 2023. At present, we're awaiting a cut in Metro service that is to start 1 year from now that's equivalent to eliminating Community Transit's *entire* service. It's therefore more instructive what transit is doing today: are they avoiding certain streets and using others. For instance, 130th has no service cross-town over the freeway, but the BRT-like Metro #41 (from Lake City to Northgate) is 5 blocks south. At 145th, the peak-hour service goes north/south on 5th NE in the peak direction, another travels in the opposite of peak going east in 145th in the a.m., all avoiding the I-5 overpass; one peak direction, peak only route (#308) comes from the east over that overpass, another (#304) from the west turns short of it; the only all-day route (#347) goes the off direction for peak direction travel. There's no cross-town service on this street. The 155th, 185th, and 220th locations have some degree of cross-town service. Mountlake Terrace and Lynnwood Transit Centers have ample transit service all day today.

I-341-008
- Regarding specific locations: 130th should have parking along 5th NE just north of the prospective station, and particularly if the next station north is at 155th or 185th. For 145th, due to the high traffic on that street (over 30,000 vehicles/day on the east approach, over 25,000 from the west; see http://cosweb.ci.shoreline.wa.us/uploads/attachments/cck/Council/Staffreports/2012/Staffreport022712-9a.pdf), parking should be split: perhaps a location in the 145th/15th NE-20th NE area, which should be a consideration for 130th and 155th options as well. For 155th, I was surprised that expanding the existing parking at Twin Ponds Park (just west of the I 5 overpass) into a garage wasn't considered. Shoreline Community College to the west is expanding its campus, the city is aiming to make the Westminster Square to the west more viable, developments are planned to the east (15th NE), other destinations (Crest Cinemas, skateboard park) are nearby, and buses travail in all 4 directions. For 185th,

2

provided in the Transportation Technical Report that supports the Draft EIS impact analysis as well as the design of station areas and ongoing access planning. An inventory of existing transit services is also included in the Transportation Technical Report. City future land use plans were evaluated during analysis of station siting, and is also discussed in Section 4.4 of the EIS.

I-341-005

All of the light rail alternatives would meet or exceed local jurisdictional, Sound Transit, and ADA design standards for pedestrian facilities fronting the stations areas and roadways that are reconstructed as part of the project. Specific locations where increased sidewalk widths are needed to accommodate peak pedestrian volumes are identified in the Transportation Technical Report, which is included the Final EIS as an electronic document. Bicycle lanes may be added to roadways reconstructed for the project where possible, but extensive bicycle lane striping or sidewalk completion is not a component of this project.

Section 3.2.8 discusses safety at intersections impacted by the project. Pedestrian and bicycle volumes are expected to increase at intersections near proposed stations, which could result in greater potential for conflicts. However, the project would have minimal impact on traffic safety; station areas will be designed for multimodal access and to minimize the potential for traffic conflicts. At NE 145th Street, for example, the project would improve safety with geometric modifications and access changes with a new signal at the I-5 northbound on-ramp at 5th Avenue NE.

I-341-006

Your comment is noted. These factors were considered in the TOD potential analysis.

I-341-008

doing the same – expanding the existing – in this case stadium parking lot into a garage makes the most sense, and I'd like to see wider sidewalks over I-5 in any event. In conjunction, WSDOT should install a traffic signal at 205th St./244th SW/SR-104 and 5th NE, as I suspect that 5th NE will become a major access route (given that access from beyond 10th NE to the east is challenging), perhaps even for *Swift* or *RapidRide* bus rapid transit buses. For the Mountlake Terrace Transit Center, the east location is the only one that makes sense, and they have a wide sidewalk over I-5 on the north side, while bicyclists have plenty of room to operate, though they could use a striped lane.

Good luck in what I hope is narrowing down the options, not selecting a final one.

3

I-341-007

Your comment is noted. Current transit service in the project study area is discussed in Section 3.1.2 of the EIS.

I-341-008

Your comments about parking are noted. The Final EIS discusses Sound Transit's current parking plans at each proposed station; see Section 3.2.7.

I-342-002

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall.

Subject: Comments on alternatives for segment A
Date: Sat, 21 Sep 2013 21:15:14 -0700

To Whom It May Concern:
After carefully reading through your executive summary of the DEIS, my heart is in my throat. I am going to
have difficulty commenting on it without expressing that, but that panic is, in and of itself, something you
I-343-001 need to know. I may not have a property that you confiscate (call it what it really is), but how you proceed with this project will either only moderately affect myself and my neighbors, or ruin my neighborhood (and possibly my finances). "The Greatest Good of the Greatest Number" should not come at such
a high cost to those of us that already live here.

I live within 100 yards of the intersection of Roosevelt Way and 5th Ave NE. I often work from home, and
have done since Nov 2006, so I know my street intimately. My street, NE 130th, will see only 4-6 cars NOT
belonging to residents all day long. Neighbors walk their dogs up and down it. Hardly anyone parks on it -
cars are tucked neatly into driveways. Gardens are usually well-tended, even creative, since they are on
show to everyone. Because of our numerous trees, we get many birds, from migrating Juncos, to resident
hummingbirds and Steller's Jays. My neighbors two doors down the hill have had the rare and endangered
Pileated Woodpeckers visiting their garden all summer. We only get this sort of wildlife here because of
our extensive tree canopy and our peace and quiet. If the wind is from the east, birdsong is often louder
than I-5.

1

I-343-001

Your concerns about the Lynnwood Link Extension impacting your neighborhood are noted.

I-343-002 If you put a station at NE 130th St, the ensuing traffic (car and foot), and noise, as well as the felling
of so many mature trees that screen us from the freeway, will considerably diminish our quality of life.
There is very little room for a station at this intersection, compared to what is available at NE 145th St,
which you can plainly see from the satellite view on Google Maps. Noise will more than double, and because
of the 130th St Bridge over the freeway, you won't be able to erect a noise mitigation wall which will help
us. Soundproofing insulation in our houses won't help if we want to open a window - or enjoy gardening, or
a barbeque outside; nor will it keep wildlife from being frightened away.

I-343-003 Because of the tight site at NE 130th St, you won't be able to provide nearly enough parking, so train
riders will either not be able to find parking in the designated lot you will supposedly build, or will
I-343-004 ignore it, and will turn our street into a parking garage instead. Inevitably, car crime, litter, and graffiti will follow. It's no good saying that you will plan for this contingency - you will plan for what
you think SHOULD happen rather than for actual human behaviour. If this sounds cynical, I can point to an
excellent example of this 250 yards down 5th Ave NE, where the elimination of the Northgate North Park &
Ride to build a new park resulted in most of those people driving half a mile north and parking all up and
down 5th Ave NE (making it much more dangerous to cycle there, past all of those parked cars (none of whom
ever seem to look before opening their doors)). Send someone up here and I'll be happy to show you this
Unintended Consequence. Moreover, your own studies apparently state that you'll hardly gain any riders by putting a station at 130th St. Is it worth ruining our neighborhood to serve a few hundred other people?

I-343-005 My comments could apply nearly as well to the proposed 155th St site. Once again, it is a relatively quiet
residential area, though it already has more traffic than we do. To my mind, the alternatives that put a
station at 145th St are the only ones that keep disruption to a minimum throughout segment A. 145th St is
already very busy, and has much more room geographically speaking for a station and parking which could
serve both North Seattle and South Shoreline. This more versatile location would save money by eliminating

2

I-343-002

Noise walls are planned for all alternatives in this area as mitigation for the light rail noise impacts that exceed the FTA criteria. See Section 4.7 in the Final EIS for the projected noise impacts in your area.

Foliage, if dense, can provide slight reductions in noise levels. It could provide up to a 3-dBA reduction in transportation noise for locations with at least 100 feet of dense foliage that contains leaves year-round. However, a 3-dB reduction in noise level is barely perceptible to most people, so foliage in virtually all areas of this project corridor has little effect in reducing noise.

I-343-003

As you noted, parking would be limited at the NE 130th Street Station, if it is built. One station option calls for approximately 100 spaces at a leased lot and another station option would not include parking. Chapter 2 of the Final EIS describes the NE 130th Street Station options.

I-343-004

Your comments about crime at the NE 130th Street Station are noted. See Section 4.14.2 in the Final EIS for Sound Transit crime analysis. Crime is not expected to increase as a result of operation of the stations. Several studies have concluded that crime around stations mirrors crime rates in the surrounding neighborhoods. Most areas in the project corridor have low crime rates. The stations would be well lit, continually monitored by security cameras, and regularly monitored by security personnel. 2010 crime statistics related to already built Sound Transit facilities show that the crime rate per number of riders at transit facilities and on light rail and commuter rail trains is substantially lower compared to overall per capita crime rates in the surrounding neighborhoods.

I-343-005 one station; the money saved there could be spent to make sure that the mitigation for local residents and wildlife was as effective as possible - instead of an afterthought. With that in mind only alternatives A1 and A3 are acceptable.

I-343-006 If those of us who live on the doorstep of a proposed station weren't scared already, your online panel discussion would have done it. Your spokesman Michelle made it clear from the language that she used in the panel discussion that one of your goals is to PROMOTE "Transit-Oriented Development" in the neighborhood of the stations - which virtually assures that whatever neighborhood gets a station will change out of all recognition. This will certainly increase tax revenues from the people you can shoehorn into the site, and

I-343-007 will certainly eliminate yet more of Seattle's already shrinking tree canopy. Your spokesman Steve, when asked about impact on the Thornton Creek watershed, just muttered something about "complying with all the regulations" by which he means he doesn't give a f**k as long as all the correct boxes are ticked on the forms. He mentioned providing "replacement wetlands" - clearly NOT in the Thornton Creek watershed (and therefore no use to those of us who live there), which, in case you had forgotten, is supposedly a salmon stream, albeit a degraded one. I find it utterly hypocritical of you to be so easy on yourselves in these circumstances when you are so tough on struggling farmers in these counties if they get anywhere remotely NEAR a tiny tributary of a salmon stream. But hey, they aren't a fashionable minority either, are they? We can get our food from Mexico, right?

I-343-008 In summary: If you put a station at 130th, you may not need to confiscate my house, but you will probably degrade my neighborhood's quality of life so much that I will be forced to try to sell it, and probably lose money on it, 'cause no family in their right mind will want it. A developer will be able to buy it cheap enough that he can put a "multi-family" development on it - shorthand for an edge-to-edge 4-pak

I-343-009 townhouse development encouraged by your TOD rezoning, complete with poisonous stormwater runoff flowing directly downhill into Thornton Creek and thence into Lake Washington. You will have eliminated all the mature vegetation that provides stormwater storage and filtration, and wildlife habitat. A win-win situation all round.

3

I-343-005

Your comment stating your preference for the Segment A alternatives that include a proposed light rail transit station at NE 145th Street is noted.

I-343-006

Sound Transit is interested in transit-oriented development in locations where it makes sense, so each proposed station location was assessed for that potential; see Section 4.2.4 of the Final EIS. This does not mean that all stations are good candidates for future development. Sound Transit prepared a *Station Area Transit-Oriented Development Potential Report* that provides details about each station area and how it might (or might not) support future development. Each city must be involved in discussions about how, and if, development might occur around a station. At the NE 130th Street Station, the current zoning to support future development is limited. Any rezoning is the responsibility of the City of Seattle and not part of the Lynnwood Link Extension project.

I-343-007

One of the key considerations in the development of the design alternatives was the protection of ecosystems, including wetlands and streams. Numerous federal, state, and local environmental laws and regulations have been enacted with this goal in mind; Sound Transit plans to comply with these laws and regulations. Sound Transit's commitment to ecosystem protection is further demonstrated through the agency's policy [Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007)] on ecosystem mitigation, which is to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects. These values are incorporated in the design of the alternatives for this project.

I challenge your design team to prove me wrong.
Dejectedly yours,
Dr. Emily A. Jewell DVM

4

Section 4.8 of the Final EIS presents all the anticipated impacts on ecosystem resources by the project, and presents mitigation measures to address those impacts that would be unavoidable. One of the potential compensatory mitigation locations for wetland impacts is along North Branch Thornton Creek.

I-343-008

Your concerns about the value of your property near a light rail station are acknowledged. Section 4.3 of the EIS discusses the impact of the transit facilities on property values.

I-343-009

Sound Transit recognizes the importance of Thornton Creek and the citizens living within its watershed. Managing stormwater runoff to Thornton Creek and its tributaries is a priority for Sound Transit. Sound Transit will control potential risks to water resources through project planning, design, and the application of required best management practices. Sound Transit will improve conditions in the watershed by replacing existing areas of non-native vegetation with native plants. Sound Transit also will minimize the potential for construction of the project to interfere with possible future fish habitat restoration projects by designing and locating project features to avoid Thornton Creek.

To The Sound Transit Board,

My name is Wendy Nelson and my family lives at 20043 12th Ave.N.E. directly below the Lake Forest Park/ Edmonds exit of I -5. This also puts us directly below the path of your Sound Transit project which will have a major impact on our home and neighborhood. I have read the DEIS report and talked to Matt Sheldon several times about our serious safety concerns. I would like to thank Mr. Sheldon, again, for coming to our neighborhood barbecue to speak with us about Sound Transit's plans. Still many of my fundamental questions have yet to be answered with any degree of certainty or hard information.

I-344-001

The terrain between our home and I-5 is a very steep, tree covered hillside comprised mostly of fill dirt from the original I-5 project. My home is at the very bottom of this hillside and roughly 90 feet from your proposed rail line. This greenbelt between us and the freeway acts as a sound barrier, a beautiful visual barrier but more importantly the trees protect the hillside from erosion and absorb a great deal of water runoff heading towards the creek that borders the other side of our neighborhood. I would like to know your plans for dealing with the water run-off, the destabilization of our hillside during construction and the continued stability of the hill after your project is finished. I would also like to know your plans for sound mitigation as well as the impact of continued vibration on the hillside. What safeguards are in place in case of earthquake or accident? Where can I see the results of your soil tests from our hillside? Who do we contact when trees from the state's hillside fall onto our property once you remove the current windbreak of trees? What are your precautions to prevent mudslides?

I-344-002

My neighbor Michael Cameron has submitted an alternate plan for this leg of your project and I ask that you please give it serious consideration. It allows the track to avoid our neighborhood entirely and puts the rails on a trajectory more inline with the Mountlake Terrace transit center where the station will be located. I can only hope this change would be more cost effective than building sound walls, walls with landscaping for erosion control, catch ponds for water run -off and the strong possibility of lawsuits should any of these solutions fail to work. While we have been told repeatedly that you will be living up to all the required federal standards for all of these issues it has been my observation that federal standards are generally not the " gold standard" for an industry but more along the lines of the bare minimum required by law. We find these are very limited reassurances for us.

We love our homes and the quality of life our neighborhood has provided for us. We all chose this area for the beauty of it's setting. We're blessed with the variety of wildlife that inhabits the hillside including the occasional deer. I hope you will give us the same kind of consideration you would want for yourselves and your neighbors if this project was in your backyard.

Sincerely,

Wendy and Ken Nelson

I-344-001

The EIS includes a summary of the geologic hazards that have been identified in the project areas. The project design will address identified geologic hazards, including evaluation of erosion potential and slope stability along the project alignment, in accordance with applicable building codes. The project design plans will address stability of both the light rail elevated structure and the steep slope between I-5 and your property that is affected during construction and after construction. At this time, site-specific recommendations for prevention of mudslides or landslides on your property are unavailable, but will be available as the design progresses into final design. Sound Transit will employ measures to prevent slope destabilization during construction and operation of the project. Section 4.9 of the EIS discusses the mitigation for erosion and sediment control during construction. Section 4.11 discusses impacts to the geology and soils in the project area. Section 4.7 addresses noise and vibration impacts, and describes mitigation to address them.

I-344-002

Your concerns about the project's potential impacts on your property are noted. Sound Transit received Mr. Cameron's alternate plan, and it is included in this set of comments and responses. The Final EIS Appendix F, Conceptual Plans, shows the proposed alignment for the Preferred Alternative. Sound Transit has proposed mitigation outlined in the Final EIS and mitigation commitments listed in Appendix N to address project impacts, with the intention of avoiding and minimizing impacts on adjacent land uses.

To: Lynnwood Link DEIS
Subject: RE: Lynnwood Extension DEIS

Please use this copy not the one previously sent.

Thank you for the opportunity to review and comment on the Draft DEIS for the Lynnwood Extension. This email contains comments and concerns regarding the routing and analysis. For perspective, I have a degree in Sustainable Transportation and Livable Communities and worked on the design and build-out of several LRT lines in the Minneapolis-Saint Paul region and served on the Senior Staff team for the HUD Sustainable Communities Grant. I also worked for the State of Washington for 17 years leading implementation of the Economic Adjustment Initiative, a component of the NW Forest Plan, and served as Senior Planner under Growth Management Services where my specialties were SEPA-GMA integration and economic development. I have been active in the Latvian community in Minneapolis and in Seattle, where I taught in the Latvian School, performed with the folk dancing troupe, and sang and led ensembles and artistic performances. My son was christened at the church.

My comments are specific to the environmental justice aspects of the project, and the preferred alternative.

Environmental justice

I-345-001 Nineteen years have passed since the signing of Executive Order 12898. While the Environmental Protection Agency has been the primary steward of the Environmental Justice Executive Order. In 2010 the Federal Transportation Department and the US Department of Housing and Urban Development joined the effort , thus escalating the importance and prominence of environmental justice in decision affecting the building of regional transit systems and other major federal investments. This action had immediate effect in Saint Paul, where during the planning for the Central Corridor the lo-mod income community in the Rondo neighborhood was bypassed by the train that would pass directly through their community. The outcome of their outrage and concern was the addition of three stations and commensurate federal resources to accomplish the task. It also put the federal spotlight on Minneapolis-Saint Paul to ensure that the region developed and implemented citizen participation and engagement in a matter that was culture and community sensitive, genuine and creative in its tools and tactics, and shared decision-making with the communities.

The Minneapolis and Saint Paul community where highly sensitized to the various aspects of environmental justice; that it is more than giving those from underserved and underrepresented communities the vehicles and the direct access into the decision making process for major infrastructure investments like light rail, it was also recognition that culture is an important aspect of environmental justice. This is important as our country and the Pacific Northwest region continue to diversify.

It is my assertion that cultural diversity and the definition of environmental justice communities are relevant when considering the impacts of routing, mode, and construction of the proposed Lynnwood extension. Culture is a component of sustainability and environmental justice. In 2004, the National Environmental Justice Advisory Council released a report containing several recommendations that are directly relevant to this project including:

1

I-345-001

Thank you for your detailed comments on the environmental justice, pertinent regulation, and your own personal experience associated with the Saint Paul Central Corridor Light Rail Project. Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the church property would be acquired for the Preferred Alternative and other at-grade alternatives. Elevated alternatives would also require a portion of the church property.

Sound Transit communicated with representatives from the Latvian Evangelical Lutheran Church prior to the release of the Draft EIS; see Appendix L of the EIS, which lists all the project's outreach activities.

I-345-001

- "Encourage enhanced community assessments and communication methods to improve cultural sensitivity for environmental justice communities"
- "There is an acute necessity to improve and create more effective communication between facilities, regulators and environmental justice communities"
- "New and consistent opportunities are needed to help environmental justice communities influence decisions"

While the provides the standard socio-economic review typical of most planning documents of its kind, it is silent on the matter of cultural environmental justice. Cultural environmental justice is not always correlated with underrepresented or underserved communities, it is often associated with a history of diaspora. If a community has a critical mass in a community like Seattle, for example, the reasons are often linked to displacement and where refugees secured sponsorships to relocate and start new lives. Our country has experienced waves of displaced people coming to its shores. Many of these communities stick together, recreating home and continuing traditions while living in a larger macro American society.

I think the environmental review of the Lynnwood alternatives should be strengthened with language added that: 1) the Latvian Lutheran Church is a vital cultural center that serves as a focal point for cultural, social, and political activities of Baltic communities across the western states and Canada, 2) there should be on-going communication between the Project Office and the Baltic community, with the community invited to participate on the Communication Advisory Committee, the Business Advisory Committee for the LRT project and other project management bodies, and that 3) the Baltic Community should be directly involved in the decision-making for the proposed Lynnwood extension.

My understanding is that the leadership and members of these communities had no idea that the alternatives analysis was underway in 2010-2011, so the DEIS was a surprising and unpleasant shock. It goes to show that standard forums of outreach: press releases, public meetings, etc. are not the most effective ways of reaching today's public; intentional and innovative community engagement by Sound Transit. This is especially needed in corridors like this one where there are multiple issues and multiple actors. Sound Transit failed in this area and needs to do more to genuinely engage the communities it seeks to serve.

I-345-002

Preferred alternative

First, it needs to be stated that light rail is not going to resolve the congestion issues in the project area. Congestion is likely to worsen even with the introduction of light rail. Light rail could possibly be part of a solution that includes completing the HOV lanes, introducing BRT along key corridors and on I5, and ensuring that different transit modes, including bike and pedestrian amenities, are built out and functional. I know there is some BRT in the area but it really doesn't function like BRT should (and the removal of express bus service because there is now BRT does not serve the region's riders at all.) Further, since more modes will be needed, are the proposed stations located in the right place? Will future BRT stop in the same places? Will the modes "talk" with each other to make navigating the systems easy for riders?

Second, each alternative considers only at-grade and elevated tracks. The Sounder between downtown and the airport does a little bit of everything: at-grade, elevated and tunneled. Why isn't tunneling considered along this segment of the build-out? It seems that more geotechnical analysis is in order before it is determined that one of the proposed alternatives is the best one.

Third, any alternative that takes out housing, multifamily housing, and environmental features like a restored wetland is a red flag. In the instance of multifamily housing, removing these developments to make way for light rail is an oxymoron. Light rail encourages density. In this instance, the train is taking it out.

2

I-345-002

The analysis of traffic conditions presented in Chapter 3 compare future traffic conditions for 2035 for the No Build Alternative (without extension of the light rail system) and the light rail alternatives as people will opt to ride light rail. Section 3.2 explains that vehicular traffic will increase in the future, but it will not increase as much under the light rail alternatives. Completing the HOV lanes on I-5 is part of the evaluation of alternatives considered in the Draft EIS because such improvements are not under the purview of Sound Transit. Sound Transit will coordinate with the transit agencies serving each of the station areas in the future, but it will be the responsibility of the transit agencies to decide on the best alternative to improve bus transit connections to the proposed light rail stations. Light rail stations will included pedestrian and bicycle facilities; see Section 3.2.5 in the Final EIS. Chapter 3 discusses bus integration in Section 3.1.2.

Regarding tunneling, the topography in the project corridor lacks major changes that would point to a tunnel configuration as the most practical or cost-effective design approach. Sound Transit's alignment policy, described in Chapter 2, reserves tunneling as an alternative only when topographic, density, lack of available right-of-way, or environmental concerns mark other options inappropriate.

It is true that the Lynnwood Link Extension Project would remove multi-family housing and impact some wetlands. Sound Transit has attempted to minimize these types of impacts to the extent possible while designing the project to address the project Purpose and Need.

The extensive traffic modeling conducted at this initial phase of the project examined travel patterns of the work force residing in north Seattle to make sure that the selected project corridor would best serve the travel needs of workers. A map of the travel patterns of the north Seattle to Lynnwood laborshed is not included in the EIS, but the

I-345-002

Finally, I have several macro suggestions:

- that you add a laborshed analysis to your review to determine if the workforce actually resides where the proposed stations are placed. It is possible to map laborsheds, Portland does this for example with planning routes, and you may not be reaching the places where the most workers reside or need to go, and
- that Sounder revisit its alternatives analysis to determine if all possibilities were really examined or not (going where you have the most right of way isn't always the best route.) It seems that they were not, especially when coupled with the reasonable assumption that the engagement during the alternatives analysis phase was minimal and passive.

I-345-003

In closing, any route that removes a cultural center of regional significance, has only five stations with negligible or minimal opportunities for transit-oriented development, and that removes housing is unacceptable. In the spirit of environmental justice where:

- Fair treatment means that no group of people should bear a disproportionate share of the negative environmental consequences resulting from industrial, governmental and commercial operations or policies

- Meaningful Involvement means that:
  1. people have an opportunity to participate in decisions about activities that may affect their environment and/or health;
  2. the public's contribution can influence the regulatory agency's decision;
  3. their concerns will be considered in the decision making process; and
  4. the decision makers seek out and facilitate the involvement of those potentially affected

the impacts of the Preferred Alternative to the Baltic community and its cultural center of regional significance are unacceptable. A route, mode, or engineering solution that removes the impacts is welcomed.
If, upon further, transparent and inclusive analysis other routes prove unfeasible for technical reasons then, commensurate compensation to the center and the community for the loss or reduced functionality of its center is appropriate, as is an environmental justice grant to support collaborative problem-solving and participation in the planning process and in developing mitigation priorities of any impacts and unforeseen and unintended consequences.

Sincerely,
Karina Berkholtz

3

analysis conducted closely examined available data to make sure the selected light rail transit corridor would best serve the metropolitan area.

Prior to starting the EIS analysis, Sound Transit performed an extensive Alternatives Analysis, which considered several routes and transit concepts. The Alternatives Analysis is located on the Lynnwood Link Extension Project website, within the document archive. Chapter 6 of the Final EIS describes the public outreach encompassing the Alternatives Analysis and continuing through the EIS process.

I-345-003

Your comments are noted. As mentioned in the response to comment I-345-001, the Latvian Church will not be displaced by the Lynnwood Link Extension because Sound Transit was able to redesign the access to that property.

Note: A duplicate set of comments was received as part of the email and is not reproduced here but is retained in the project files.

Subject: Sound Transit Lynnwood

I-346-001 I prefer the **C-4** plan proposed by the City of Lynnwood to Soundtransit for the LynnwoodLink.

C-4 has the least impact on Scriber Lake Park, wetlands and wildlife in our area.
Also, **C-4** has the least impact on businesses and residents who would need to relocate.

C-1, C-2 and **C-3 are not acceptable!**

I attended the Sept. 14th meeting at city hall regarding this subject.

Thank you,

Ginny Harris

Your preference for a new Alternative C4 that has been recommended to Sound Transit by the City of Lynnwood is noted. What you refer to as Alternative C4 is similar to a modified Alternative C3, which is the Preferred Alternative. Chapter 2 of the Final EIS provides a description of the Preferred Alternative.

Subject: Rail station in Lynnwood

I attended the meeting on Sat. Sept. 14 at Lynnwood City Hall where the proposals for the location of the new light rail station was shown and discussed by the people attending. I would like to see the rail line put where there is the least disturbance to the Scriber Lake and creek areas and also to not displace homes and businesses. After reviewing the proposals and also by going by car over to see the sites I think a rail line and station can be put where there is no tearing down of homes or business buildings. I-347-001

There was concern about the disabled not being able to get off the rail train and getting over to the buses. I think that is where the Dart buses would come in to play. The rail station can be put very close to the Lynnwood Park and Ride bus station where transfers can be made easily by walking or by the Dart bus. I-347-002

The "C" Proposal would be the best of the proposals that we were given to consider. I understand that the fourth proposal could not be used because the rail line at this time stops at the Lynnwood Park and Ride. I would like to see the "C" Proposal used as the priority and from that proposal make modifications if they are needed. I-347-003

The Preferred Alternative evaluated in the Final EIS minimizes impacts to Scriber Creek Park and wetlands, businesses, and residents. Section 4.1 of the Final EIS discusses the project's property impacts for each alternative, Section 4.8 for wetland impacts, and Section 4.17 for parks impacts.

I-347-002

All Sound Transit facilities are designed to meet the requirements of the American with Disabilities Act (ADA). Paratransit load/unload locations will be reviewed during final design to minimize travel distance for persons with disabilities.

I-347-003

The comment names a proposal that was not part of the EIS or part of later suggestions by the City of Lynnwood. Sound Transit has developed a modified Alternative C3 as the Preferred Alternative.

Subject: LATVIAN CENTER - Northgate - Sound Transit Link Light Rail

Hello,

My name is Brianna Freimanis. I am a member of the Latvian community here in Seattle and am here to voice my concerns of the impact of the Lynnwood Link Extension in Northgate on our church and community center.

The Latvian Lutheran Church is the central gathering place for friends and families of Latvians living in the area. It is used very frequently by Latvians, Lithuanians, and Estonians living in and around Seattle for functions such as church services, rehearsals, weddings, meetings, and a Latvian school, which I attended as a child.

I am a member of the Latvian folk dance group, Trejdeksnitis. We rehearse at the Latvian center every week, and would like to continue doing so as we perform very frequently and at international festivals, like the Latvian Song and Dance Festival we participated in this summer. I am also a singer in our choir, Sigulda, which performs at various festivals, community gatherings, and church services. Personally, the groups I am involved in use the center at least 2 times a week. If we lose this place to rehearse, I fear the effect it will have on our ability to continue the amazing work we do.

I-348-001

It is imperative that as construction moves forward with the Link Light Rail, we are allowed access to our center. Disrupted access or relocation of our center would weaken our community, both financially and emotionally. We have spent years re-establishing our community after the loss of our last center in the 1970s to eminent domain. We are fortunate, as a cultural group, to have recovered and maintained a place where we, friends, and family from across the country and world, can gather to celebrate our traditions. My concern is that another relocation or disruption would be detrimental to our continued cultural heritage, and perhaps would be one we may not recover from.

I fully support the Link Light Rail, and continue to hope that you will take into consideration the ongoing effects it will have on our Latvian community. Please allow us continued access to our center as you move forward with the Lynnwood Link extension project. Thank you.

Respectfully,
Brianna Freimanis

Following the Draft EIS, the Sound Transit Board directed Sound Transit to develop a Preferred Alternative that would avoid displacing the church. The Final EIS describes the results of additional engineering Sound Transit undertook to realign 3rd Avenue NE and avoid the potential displacement of the church. As a result, none of the Segment A alternatives evaluated in the Final EIS would displace the church or the church hall. With the realigned street, access to the property has been maintained, although a portion of land on the edge of the church property would be acquired for the Preferred Alternative. Sound Transit will also maintain access to the church and center during construction.

Greetings

I-349-001 I urge you to take all reasonable means to accommodate bicycle riders on light rail and to encourage the development of safe bicycle and pedestrian routes to transit stations

My children, grandchildren and I all ride bicycles and would appreciate a safe and convenient alternative to the automobile

Thank you

Hank Landau

Bicycle facilities, including bicycle parking, will be included at light rail stations and on the trains. The project will include ADA-compliant pedestrian facilities that front the station areas and roadways that are reconstructed as part of the project.

Subject: Options at 145th St. Station

I-350-001

A formal request to highly consider the option that moves the on-ramp North.

It is evident that this option is more difficult to adopt due to additional logistics with the DOT.

However, I implore that it IS THE adopted option due to additional bus access to the station (distance from on-ramp will be from one side of station rather than in the middle, allowing for a more sophisticated Shoreline bus transfer location than just two bus slots).

Another important item to consider is the reduced need to acquire the properties on the South side of 148th St., as well as reducing the negative effect of the properties on the North side of 148th St.

I thank you for reading this email, and I sincerely hope that these comments are deemed sound enough to warrant serious consideration.

Sincerely,
Matthew Alan Maxwell
(Life long resident of 145th impact area.)

What great thing would you attempt if you knew you could not fail?
-Robert H. Schuller

I-350-001

The Preferred Alternative moves the on-ramp to the north, which you indicate would be your preference. See Appendix F, Conceptual Plans, of the Final EIS. Section 4.1 and Appendix I-4.2 discuss the project's property impacts.
